Descriptors: *Watershed management, Channels, *Channel erosion, Regulation, Roads, Soil erosion, Soil stabilization, Stream erosion, Water resources, Lumbering, Clear-cutting, Applachian mountain region.
Identifiers: *Channel protection, Stream damage, Timber harvest.

Some popular beliefs are contrasted with research results concerning timber harvest as a modifier of forest stream channels. A few commonly used terms are defined but no new research results are presented. Logging in or too close to streams is identified as the major and indefensible cause of most unwanted channel modification. Tree cutting, log skidding, and road building can cause soil erosion and stream sedimentation but these intermittent activities seldom cause major channel modifications. Evidence is accumulating that timber harvest with minimal stream damage can become the rule if loggers observe well-known precautions to protect soil and water resources. (Forest Service)

EFFECTS OF MANAGEMENT PRACTICES ON WATER QUALITY AND QUANTITY: FERNOW EXPERIMENTAL FOREST, W. VIRGINIA,
Forest Service (USDA), Parsons, W. Va. Northeastern Forest Experiment Station.
J. N. Kochenderfer, and G. M. Aubertin.
In: Municipal Watershed Management Symposium Proceedings, USDA Forest Service General Technical Report NE-13, p 14-24, 1975. 5 fig, 2 tab, 10 ref.

Descriptors: *Watershed management, Deciduous forest, Forest management, Hydrology, *Water quality, Water yield, Watershed(Basin), *West Virginia, Water supply.
Identifiers: *Fernow Experimental Forest(W Va), Merchantable timber products.

Results of 22 years of forest hydrology research on the Fernow Experimental Forest are reviewed. Forest influences were measured on quantity and timing of streamflow and on parameters of water quality such as turbidity, temperature, specific conductance, pH, alkalinity, and nutrient concentrations. These results indicate that it is currently not practical to manage forest land for both sustained increased water yield and merchantable timber products, and that forest land can be managed for a variety of uses without impairing water quality if these uses are regulated intelligently. (Forest Service)

FOREST MANAGEMENT AND NUTRIENT CYCLING IN EASTERN HARDWOODS,
Forest Service (USDA), Parsons, W. Va. Northeastern Forest Experiment Station.
J. H. Patric, and D. W. Smith.
Research Paper NE-324, 1975. 12 p, 3 fig, 5 tab, 62 ref.

Descriptors: *Cycling nutrients, *Deciduous forests, *Forest management, *Nitrogen, Rotations, Nutrients, *Reviews, Lumbering, Northeastern US, Southeastern US.
Identifiers: *Literature review, Forest stands, Harvesting wood.

The literature was reviewed for reports on nutrient cycling in the eastern deciduous forest, particularly with respect to nitrogen, and on effects of forest management on the nutrient cycle. The nutrient content of the forest stand is a relatively small part of the total nutrient pool contained in soil. Under present practices of harvesting wood on a 50- to 100-year rotation, nutrient deficiency as a result of crop removal seems unlikely on most forest land. (Forest Service)

FLOODFLOW CHARACTERISTICS AT BRIDGE SITE ON INTERSTATE HIGHWAY 80, THE GREEN RIVER NEAR GREEN RIVER, WYOMING,
Geological Survey, Cheyenne, Wyo.
G. S. Craig, Jr.
Open-file report 76-237, March 1976. 12 p, 6 fig, 1 plate, 1 ref.

Descriptors: *Flood data, *Flood frequency, *Flood profiles, *Wyoming, Peak discharge, Bridge construction, Reservoirs, Streamflow, Hydrologic data, Mapping, Wyoming.
Identifiers: *Green River(Wyo), 50-year flood.

This report was prepared in 1964, before construction of the Interstate Highway 80 bridge and the Fontenelle Reservoir near Green River, Wyo. Owing to renewed interest in the floodflow characteristics of the river, it was decided in February 1976 to release the report to the open file. During the intervening years, the I-80 bridge was built and the Fontenelle Reservoir was constructed. Except for the addition of metric units, the original text has not changed. The 50-year flood at the bridge centerline was estimated to be 20,100 cfs. Elevation of this flood at the approach section 465 ft upstream from the bridge site is 6,099.3 ft. Annual peaks are most likely to occur in May or June. Fontenelle Reservoir, under construction in 1964, can pass flows much greater than the 50-year flood. Mean velocity in the approach section for the 50-year flood is about 4.2 fps overall and 5.8 fps in the main channel. Such velocities could cause scour, especially just upstream from the right abutment of the I-80 bridge. (Woodard-USGS)

Identifiers: *Municipal watersheds.

During the past 30 years, forest-watershed-management research has produced a wealth of information about, water-yield augmentation and water-quality protection. The purpose of this Symposium was to bring together some of the research

LIBRARY OF THE UNIVERSITY OF TEXAS

and management information that would be useful to municipal watershed administrators in formulating land-management policies. Increasing population and improved technology have placed new values on the forest and water resources, particularly in highly urbanized regions. Continuing urbanization has increased water demands and has necessitated that watersheds be managed for maximum water production, while at the same time there are mounting public pressures to utilize these areas for recreation.

DECISION ANALYSIS FOR WATERSHED MANAGEMENT ALTERNATIVES,
Arizona Univ., Tucson, School of Renewable Natural Resources.
M. M. Fogel, J. L. Thames, L. Duckstein, and D. R. Davis.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 189, $3.50 in paper copy, $2.25 in microfiche. Completion Report, January 1976. 16 p, 27 ref. OWRT B-032-ARIZ(23). 14-31-000-3858.

Descriptors: *Watershed management, *Decision making, *Flood control, *Irrigation, *Water yield, Sediment yield, Optimization, Snowmelt runoff, Land use, *Model studies, *Alternative planning, Time seris analysis, Structural design, Water policy.
Identifiers: *Stochastic analysis, Vegetation management, Bayesian analyses, *Watershed models.

The primary purpose was to develop a methodology for watershed managers to use in resource development and conservation decision making. Stochastic event-based precipitation models were derived to serve as inputs into deterministic watershed models with the result that a time series of hydrologic outputs could be obtained. These outputs, water and sediment yields and peak flow rates, could then be used to reflect the extent of man's activities in modifying the environment, as ell as for the optimal design and operation of water control facilities. The effort was directed for moderate-sized watersheds where little or no streamflow data was available, but precipitation information could be obtained from onsite or nearby locations. A variety of problems were modeled by this approach, such as, predicting snowmelt runoff, modeling hydrologic effects of land use changes, stochastic analyses of water yield increase from vegetation management, and the design of floodwater retarding structures. The project demonstrated that inventory control techniques could be adapted for obtaining an optimal irrigation policy, i.e., one that mixiimizes net returns to farmers. Bayesian decision theory was used in conjunction with event-based precipitation models for obtaining the desin of a structure tailored to a specific problem rather than using a pre-specified criteria such as the 100-year flood.

CONSIDER THE PLANT IN PLANNING WIND EROSION CONTROL SYSTEMS,
Agricultural Research Service, Big Spring, Tex.
D. W. Fryrear, and J. D. Downes.
Transactions of the American Society of Agricultural Engineers, Vol. 18, No. 6, p 1070-1072, November-December 1975. 3 tab, 14 ref.

Descriptors: *Wind erosion, *Crops, *Erosion control, Plant growth, Planning, Soils, Winds, Wind pressure, Onions, Carrots, Cotton, Tomatoes, Laboratory tests, Soil moisture, *Great Plains.
Identifiers: *Soil fluxes, *Crop survival, Southern Great Plains, Peppers, Cabbage, Cucumbers, Sandy soils, Southern peas.

Wind erosion on sandy soils in the Southern Great Plains is a problem for thousands of farmers yearly. Eight crops were exposed to windblown sand injury in a laboratory wind tunnel. The relationship between plant survival and exposure conditions was determined. Soil fluxes (windblown sand) were established for 80% survival of the crops tested, which showed that 6-day-old southern peas could withstand a soil flux of 0.8 gm/cm width/sec for 10 min while 6-day-old peppers could withstand an estimated 0.04 gm/cm width/sec. Computed soil fluxes for various field conditions showed that a combination of surface residue and roughness of 2,500 kg cm/ha would reduce soil fluxes to 0.08 gm/cm width/sec, which would be sufficient to protect five of the eight crops from severe injury. A moist soil surface was found to reduce soil flux 50% as compared with a dry soil, but surface moisture for sandy soils was very transient and could not be considered an effective erosion control technique. Surface soil moisture increased clod formation when the soil was cultivated, and the rough soil would reduce erosion potential. (Roberts - ISWS)

SEDIMENT STORAGE IN CHANNELS DRAINING SMALL FORESTED WATERSHEDS IN THE MOUNTAINS OF CENTRAL IDAHO,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
W. F. Megahan, and R. A. Nowlin.
In: Proc. 3rd Federal Inter-Agency Sedimentation Conf. 1976. Denver, Colo., Mar. 22-25, 1976. Sedimentation Comm, Water Resources Council, Washington, D.C. p. 4-115 - 4-126, 1976.

Descriptors: *Erosion, *Channel erosion, *Stream erosion, *Sediment yield, Sedimentation, *Aggradation, Deposition degradation, Scour, Streambed, Bank erosion, Obstruction to flow, Continuity equation, Idaho, Channels, Small watersheds, Forest watersheds.
Identifiers: *Idaho Batholith, Granitic soils, Undisturbed watersheds, Aquatic ecology, *Sediment storage.

Considerable effort has been devoted to measuring on-site erosion and downstream sedimentation over the past 40 years. However, the role of sediment storage in channels has been almost entirely overlooked. This study was designed to measure the annual change in sediment stored in seven, undisturbed, tributary streams in the Idaho Batholith. Additional data were collected to evaluate the influence of natural obstructions such as logs, rocks, etc. on sediment storage. Extremely large volumes of sediment were trapped behind obstructions in two sample years; only about 10 percent of the stored sediment appeared as annual sediment yield. Sediment stored in channels on these undisturbed, forested watersheds, changed considerably between a high streamflow versus a low streamflow year. A continuity equation was used to estimate the annual watershed erosion. There is considerable interest in modelling downstream sediment yields in order to provide land managers with a means to meet the needs of recent pollution laws that apply to forest lands. This study illustrates the need to include channel sediment storage as a subsystem in model development. In addition, the data show that the aquatic ecosystem is naturally subjected to much larger variations in sediment deposition than was heretofore suspected. (Forest Service)

SEDIMENTATION IN RELATION TO LOGGING ACTIVITIES IN THE MOUNTAINS OF CENTRAL IDAHO,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
W. F. Megahan.
In:Present and Prospective Technology for Predicting Sediment Yields and Sources, Proc. Sediment-Yield Workshop, USDA Sediment Lab., Oxford, Miss. November 28-30, 1972 US Agric. Res. Serv. Rep. ARS-S-40, p. 74-82, 1975 5 fig, 4 tab, 16 ref.

Descriptors: Sedimentation, *Sediment yield, *Erosion, *Accelerated erosion, *Road construction, *Organic matter, Anadromous fish, Particle size, Aggradation, Scour, Riverbeds, Fish spawning, Aquatic environment, Idaho, *Lumbering.
Identifiers: *Idaho Batholith, *Granitic soils, Study watersheds, *Organic sediment, *Lithic sediment.

Sedimentation, more than any other single factor, has been a focal point for those concerned with the impacts of land uses in the 16,000-square-mile Idaho Batholith. Annual sediment yields from undisturbed, forested watersheds are presented based upon 82 station years of record from 14 study watersheds. Additional analyses are provided to indicate lithic sediment particle size and organic sediment production from undisturbed watersheds. Data are presented to illustrate effects of logging and road construction on sedimentation. Channel studies in a major salmon spawning stream show how excessive sediment deposition is removed from the channel system over a 5-year period. Such information is very helpful to land managers concerned with obtaining optimum uses of forest lands without undue impacts on water resource values. (Forest Service)

EROSIONAL EFFECTS OF WILDFIRE AND LOGGING IN IDAHO,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
W. F. Megahan, and D. C. Molitor.
In: Proceedings of Watershed Management Symposium held in Logan, Utah, August 11-13, 1975. American Society of Civil Engineers, New York. p 423-444 (1975) 9 fig, 4 tab, 18 ref.

Descriptors: *Forest fires, *Accelerated erosion, *Vegetation regrowth, Subsurface runoff, Soil wettability, *Sheet erosion, *Rill erosion, Erosion control, Slope protection, Overland flow, Storm runoff, Forest canopy, *Lumbering, *Clear-cutting, *Litter.
Identifiers: *Idaho batholith, Paired watersheds, Fire effects, Water repellent soils, Sediment production, Slash disposal, Intense burning, Coarse-textured soils, Fire ecology, Rilling, Splash erosion, Forest canopy, Erosion pin, Erosion measurement.

Erosion was evaluated on clearcut and unlogged study watersheds that had been subjected to wildfire. Soils found on the study watersheds exhibited the high erodibility characteristics of the granitic soils found in the Idaho Batholith. Erosion data were collected by rill surveys, erosion pins, splash pans, and sediment collection troughs. Additional data to record vegetation responses and soil water repellency were collected using a grid sampling technique. Considerable erosion occurred as the result of overland flow and raindrop splash on the clearcut watershed. There was no evidence of erosion from overland flow on the unlogged watershed, but there was slight splash erosion. Canopy cover effects and litter production from the fire-killed trees were probably an important factor regulating erosion on the unlogged areas. Greater fuel loading and the consequent more intense burn on the clearcut area also probably had an effect by reducing soil surface protection, influencing vegetation responses, and increasing soil water repellency. 5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

A METHOD FOR MONITORING EUTROPHICATION IN RIVERS,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
M. G. Kelly, G. M. Hornberger, and B. J. Cosby.
Completion Report, December 1975. 223 p, 28 fig, 11 tab, 45 ref, 4 append. OWRT C-5333(No. 4231)(1), 14-31-0001-4231.

Descriptors: *Dissolved oxygen, *Eutrophication, *Productivity, Water quality, Aquatic algae, Carbon dioxide, Photosynthrsis, Reaeration, Respiration, Rivers, *Monitoring, *Pollutant identification, Analytical techniques, Measurement, Methodology.
Identifiers: *Net community productivity, *P/R ratio, *Photosynthetic efficiency.

A method for automated in situ measurement of net community productivity was developed. The report describes (1) the method as it may be routinely used as a monitoring technique with completely automated data processing and the new measurement and recording system which was developed to implement the technique, (2) the applicability of the method in eutrophication evaluation in a variety of environments, and (3) a routine procedure for implementation of the method by other potential users. The utility of the technique was demonstrated. Measurements of dissolved oxygen, temperature and solar radiation were used to estimate net community production (P-R), respiration (R), gross production (P), production efficiency and the P:R ratio for six rivers during the summer of 1974. Analysis of these data and comparison with a subjective ranking of the 'eutrophy' of the rivers based on nutrient and chlorophyll data showed that productivity measurements in streams can be used to evaluate eutrophication potential. No single parameter or index proved reliable although the degree of temporal variability of community metabolism was a consistently good indicator of water quality. The analyses suggest that the eutrophication potential of an 'unknown' river can be determined by comparing several weeks of productivity data for summer, low-flow conditions with the data presented here.

COMPARATIVE STUDIES OF SOME INLAND SALINE AQUATIC ECOSYSTEMS IN NORTH DAKOTA,
North Dakota Univ., Grand Forks. Dept. of Biology.
M. K. Wali.
North Dakota Water Resources Research Institute, Fargo, Completion Report WI-221-033-76, Part I, January, 1976, 58 p, 19 fig, 15 tab, 61 ref, append. OWRT-A-031-NDAK(1), 14-31-0001-4043.

Descriptors: *Biomass, Chemical analysis, Sediments, *Dissolved oxygen, *Productivity, Temperature, Sago pondweed, *North Dakota, Ecosystems, Lakes, *Lake sediments, Saline water systems, Pollutant identification.
Identifiers: *Potamogetron pectinatus, Macrophytes, *Fox Lake(N Dak), Shallow lakes.

Potamogeton pectinatus L. is a very important wildlife food species, a submerged, marl forming macrophyte and grows as a natural monospecies community in Fox Lake, 16 km northeast of Devils Lake, North Dakota. The water, sediment, dissolved oxygen, temperature and productivity relationships were studied in this small (0.4 x 1.2 km), shallow (60-75 cm) lake. Five replicate samples of the macrophyte, sediment, water and dissolved oxygen were taken at two-week intervals during the 1972 growing season. For comparison, seven P. pectinatus sites in North Dakota, from the Minnesota to the Montana borders, were also sampled. The sediments were analyzed for pH (7.8), electrical conductivity (9.8 Mmhos/cm), organic matter (4.1 percent), particle size (44 percent sand, 31 percent silt, 25 percent clay), 14 cations and four anions. The waters were analyzed for dissolved oxygen at two depths (114 percent saturation at 10 cm and 98 percent saturation at 50 cm), pH (9.2), electrical conductivity (15.8 Mmhos/cm) 13 cations and five anions. The plant biomass (maximum of 293 gm/m2) was determined and samples were analyzed for caloric content (2972 cal/gm), carbon (54.3 percent not corrected for marl), nitrogen (1.47 percent) and 13 cations. The values in parentheses are means for Fox Lake over the 1972 growing season. The temperatures decrease with depth. The dissolved oxygen was higher in the surface waters for all dates, except the earliest sampling periods, when the macrophytes were very short. The ions in the water formed three groups, those in the sediments formed four, and those in the plants formed four groups.

INSTRUMENTAL METHODS OF MONITORING ORGANIC POLLUTION,
Water Pollution Research Lab., Stevenage (England).
R. Briggs, J. W. Schofield, and P. A. Gorton.
Water Pollution Control, Vol. 75, No. 1, p 47-57, 1976. 6 fig, 2 tab, 17 ref, 1 append.

Descriptors: *Organic matter, Monitoring, *Water pollution, *Instrumentation, Analytical techniques, Chemical analysis, Measurement, On-site tests, *Organic wastes, Organic compounds, Water properties, Water pollution sources, Sewage, Water quality, Ultraviolet radiation, Effluents, *Pollutant identification, Respiration, Oxygen demand.
Identifiers: *Monitoring organic pollution, Stevenage Laboratory, Effluent quality, Inorganic carbon, Respiration rate, Ultraviolet light absorption, Organic carbon, Tocsin carbon analyser, Dohrmann DC50 analyzer.

An instrument was described for continuously monitoring organic pollution by ultraviolet light absorption. The instrument readings are reproducible to within + or -5% of full scale, and this can be varied in the range of 5-500 mg/l carbon, depending on the sample path length. The instrument readings are largely independent of the presence of inert suspended matter, but include a significant proportion of the particulate organic matter normally present. The interrelationships between the readings obtained by various methods of analysis were discussed and it was shown that the correlation coefficient obtained from instrument readings versus BOD, COD, and TOC is certainly no worse than that obtained between BOD and COD, TOC and BOD, or TOC and COD, and in most cases was significantly better, probably because of the inherent precision of the method. THE APPLICATION OF SPARK SOURCE MASS SPECTROMETRY TO THE ANALYSIS OF WATER SAMPLES,
Accu-Labs Research, Inc., Wheatridge, Colo.
R. Brown, and H. E. Taylor.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 72-84. 6 fig, 6 tab, 6 ref.

Descriptors: *Pollutant identification, *Mass spectrometry, *Analytical techniques, *Instrumentation, *Laboratory tests, Spectrometers, Trace elements, *Water analysis, Water pollution, Water quality, Sediments, Chemical analysis, Mining, Mine water.
Identifiers: *Spark source mass spectrometry.

Spark source mass spectrometry is used routinely in the authors' laboratory to carry out a complete trace element characterization of previously unexamined samples of water. The trace element character of various nominally pure water samples

is very variable depending upon geographic location of the water source. Mass spectrometry may be used in order to carry out a complete characterization in a very short time, for site survey prior to operations and following mining operations. Many of the analytical problems encountered are extremely difficult to solve by other methods. With some ingenuity on the part of the analyst, mass spectrometry has performed well. It is being employed in many areas of analysis pertinent to a study of the environment with equal success. Much information is being produced by the routine analysis of soils, ores, coal, fly ash, oil shale, shale oil, and other fuels. The information yields helps in the correct maximum utilization of fossils fuels with the minimum environmental impact. (See also W76-06938) (Sims - ISWS)

SOME PROBLEMS OF THE INVESTIGATION OF WASTE WATERS GENERATED IN THE PETROLEUM INDUSTRY (KOOLAJIPARI SZENNYVIZEK VIZSGALATANAK NEHANY KERDESE),
E. Hills, L. Vajta, and I. Szerenyi.
Kemiai Kozlemenyek, Vol. 44, No. 1/2, p21-34, 1975.

Descriptors: *Oil industry, *Waste water treatment, *Oil wastes, *Industrial wastes, Phenols, Analytical techniques, *Pollutant identification.
Identifiers: Refinery wastes, Hungary.

Techniques for the analysis of effluents from the petroleum industry were studied. Some of the methods were improved and used for testing the waste waters from Hungarian refineries. Pollutants present in the waste streams of individual refinery units were also identified. Emphasis was placed on the determination of phenols and oil, however, analytical technique were also developed from some particular contaminants, including furfural, acetone, monoethanolamine, and diethylene glycol. The presence of surface active agents in refinery effluents complicates the analyses of such oil contaminated waters. (Takacs-FIRL)
W76-06974

THE USE OF ACTIVABLE TRACERS IN THE EVALUATION OF THE PERFORMANCE OF WASTEWATER TREATMENT PLANTS,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
T. F. Craft, and G. G. Eichholz.
Environmental Letters, Vol. 9, No. 3, p 307-325, 1975.

Descriptors: *Pollutant identification, *Sewage treatment, *Treatment facilities, *Monitoring, *Tracers, *Neutron activation analysis, Analytical techniques, Personnel, Sampling.
Identifiers: Indium, Scandium, *Activable tracers.

Stable, activable tracers have been used to assess operational conditions in waste water treatment plants. A soluble compound containing an element not normally found in the water or wastes is added to the stream. The suitable tracer element must have a high neutron capture cross section, be available at a reasonable cost, and must be nontoxic in the water at the specified concentration. Such tracers may be used to determine flow rates, residence times, flow paths, and recirculation paths in sewage treatment facilities. The sampling procedure is simple enough to be handled by typical plant personnel; neutron activation analysis facilities are also required and analyses are performed by trained laboratory technicians. Indium and scandium salts proved to be satisfactory tracer elements for the procedure. (Kramer-FIRL)

STUDIES ON COLON BACTERIA GROUPS DETERMINATION IN SEWAGE WATER (GESUICHU NO DAICHOKIN GUN SHIKEN NO KENTO),
K. Kozama.
Gesuido Kyokaishi, (Journal of Japan Sewage Works Association), Vol. 12, No. 135, p 38-39, August, 1975. 2 tab, 4 ref.

Descriptors: Analytical techniques, *Bacteria, *Sewage effluents, *Pollution identification, *Waste water treatment, *Laboratory tests, Sampling.
Identifiers: *Colon bacteria.

The number of colon bacteria groups produced from secondary treated sewage effluents was determined in sodium deoxycholate and agar culture media. The one ml sample water was placed on the 10 ml sodium deoxycholate in a Petri dish, to which another 10 ml sodium deoxycholate was added and then mixed. This was cultivated in the agar medium for 18 to 20 hr at 35 to 37 C. Colonies were cultivated and it was determined whether or not generation of gas within fermentation tubes had occurred. If so, the colony in the tube was considered as colon bacteria positive. There were basically three colony types produced. These were colonies sized 1 to 3 mm, 0.5 to 1 mm, and less than 0.5 mm. The tested sample water gave 33 colonies of the first type, 12 of the second type, and 44 of the third type. Of these colonies, the colon bacteria positivity was 73%, 83%, and 7% for the first, second, and third types, respectively. The effect of the amount of sodium deoxycholate for the culture on the generation of colony number was also studied. The use of increased amount of sodium deoxycholate decreased the generation of colon bacteria colonies. (Katayama-FIRL)

VIRUSES IN WATER: THE PROBLEM, SOME SOLUTIONS,
Baylor Coll. of Medicine, Houston, Tex. Dept. of Virology and Epidemiology.
C. P. Gerba, C. Wallis, and J. L. Melnick.
Environmental Science and Technology, Vol. 9, No. 12, p 1122-1126, December, 1975. 3 fig, 2 tab, 4 ref.

Descriptors: *Viruses, *Public health, *Water supply, *Potable water, *Sewage treatment, Sewage effluents, Analytical techniques, Water analysis, Water quality standards, Water pollution control, Monitoring, Waste disposal, Water reuse, *Pollutant identification, Laboratory tests.
Identifiers: Enteric viruses.

The public health significance of human pathogenic viruses in water has not yet been determined. Many viruses cause latent or inapparent infections and current epidemiological techniques are not sensitive enough to detect the low-level transmission of viral diseases through water. If domestic waste water is to be recycled in the future, adequate methods must be developed to ensure the elimination of enteric viruses from reclaimed water. Studies have demonstrated that these viruses survive present sewage treatment methods. Concern has also been expressed about the release of viruses into the marine environment through sewage outfalls and polluted rivers. A need exists for better equipped laboratories to perform virological surveys of drinking water supplies. Virus monitoring techniques have been developed for quantifying viruses in shellfish and in landfill leachates. The American Public Health Organization and the World Health Organization have strongly urged that provisional methods for determining viral concentrations in water be identified and that new virus standards be adopted for both potable and nonpotable waters. (Kramer-FIRL)

Descriptors: *Water quality control, *Municipal water, *Water treatment, Surface waters, Sewerage, Drainage, Treatment facilities, Dissolved oxygen, Pollution identification.
Identifiers: *Japan.

An investigation of water quality was performed from 1969 to 1973 at Kameda township in the suburbs of Niigata city, Japan. The average electric conductivity of the municipal water at three main water treatment plants were 66.7, 73.8, and 103.2 micro ohm/cm. The average dissolved oxygen was found to be 8.9, 8.4, and 8.2 ppm. The chloride, sodium, potassium, calcium, and magnesium concentrations ranged from 6.5 to 12.4 ppm, 5.9 to 8.9 ppm, 1.5 to 1.8 ppm, 5.9 to 10.5 ppm, and 2.1 to 3.8 ppm, respectively. Sewerage water at 12 drainages during drought season was also analyzed for electric conductivity and for ion concentrations of Cl, Na, K, Ca, and Mg. (Su-FIRL)

CONTINUOUS DETERMINATION OF TOC AND TOD (TOC, TOD NO RENZOKU SOKUTEI),
S. Kajiyama.
PPM, No. 9, p 32-39, September, 1975. 2 fig, 4 tab, 16 ref.

Descriptors: *Monitoring, *Analytical techniques, *Pollutant identification, *Organic compounds, Water analysis, Absorption, Water quality, Water pollution control.
Identifiers: *Total Organic Carbon(TOC).

Continuous monitoring methods for total organic carbon and total oxygen demand (TOC and TOD) were discussed. The continuous TOC measurement is made by introducing sample water into a catalytic combustion tube and generating carbon dioxide gas which is measured by NDIR. The measured CO2 absorption is the total carbon content in water; therefore, the inorganic carbon contribution must be subtracted from the measured TC to give TOC. This is done by treating the sample water with phosphoric acid and ammonium persulfate in a catalytic tube at 150 C. The generated CO2 gas may then be attributed to inorganic carbon. TOD is measured by generating gaseous compounds from the sample water ina catalytic tube at 900 C and reacting the generated gases with oxygen. After the reaction, the unreacted oxygen concentration is measured by an oxygen detector such as a Pt-Pb liquid fuel cell. The determination error is caused by the dissolved oxygen in the sample water, the presence of inorganic compounds having the capability of liberating oxygen, and the uncertainity in oxidation efficiencies of different compounds. In both TOC and TOD measurements, the correlation between analytical instruments by different manufactures with the analytical values is very poor and calibration methods differ. (Katayama-FIRL)

DEVELOPMENT OF AN OIL-WATER POLLUTION MONITORING SYSTEM,
Naval Postgraduate School, Monterey, Calif.
B. D. Tyler.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD/A-012 460 $5.00 in paper copy, $2.25 in microfiche. Master's Thesis, June 1975. 89 p, 29 fig, 8 tab, 8 ref, 4 append.

Descriptors: *Oil pollution, *Oil wastes, *Monitoring, *Pollutant identification, *Oil, Analytical techniques, Water pollution sources, Water pollution control, Water quality, Fuels, Oily water, Waste water disposal, Oil spills, Carbon, Measurement, Instrumentation, Oceans, Chemical analysis.
Identifiers: *Bilge wastes, Ballast water, Total organic carbon, Beckman Model 915, Mineral analysis, Inorganic carbon.

The prototype of an automatic oil pollution monitor was built and tested. In the system developed, a direct difference method of total organic carbon determination was utilized to ascertain oil concentrations. Using this monitor, it was possible to specify the concentration of any oil, independent of type, in a known water sample. In the final phases of the study, preliminary investigations on prototype improvements and oil concentration determinations in bilge water were initiated. (Henley - ISWS)

Identifiers: Southern Florida.

Inorganic nitrogen and phosphorus in the surface waters of southern Florida were measured by the U.S. Geological Survey during wet (June - October) and dry (November - May) seasons nine times between September 1970 and April 1975. The number of sites sampled ranged from 175 in 1970 to 500 in 1975, with a total of 2,367 samples collected and analyzed. Samples were collected from canals, rivers, lakes, coastal bays, marshes, and swamps. The locations of sampling sites and the nutrient concentrations are shown on maps. (Woodard-USGS)

STATISTICAL STUDY OF PHOSPHORUS REMOVAL IN WISCONSIN,
Wisconsin Univ., Madison.
M. H. David, F. J. Schroeder, J. J. Peirce, E. F. Joeres, and D. A. Braasch.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE2, Proceedings paper No. 12045, p 433-447, April 1976. 1 fig, 6 tab, 7 ref.

Descriptors: *Water quality, *Wisconsin, *Environmental engineering, *Sewage treatment, *Statistical methods, *Phosphorus compounds, Planning, Water policy, Polymers, Mathematical models, Design, Systems analysis, Waste water treatment, *Lake Michigan.
Identifiers: Alums.

A statistical study of water quality in the Wisconsin sector of the Lake Michigan watershed revealed that Wisconsin phosphorus removal policy has been only partially effective. A variance components model was applied to water quality data for a sample of 12 municipal treatment plants to test a variety of hypotheses pertaining to phosphorus removal methods and secondary effects on other plant variables. Towns treating with iron compounds achieved significant phosphorus reduction; towns treating with alum did not, possibly because of insufficient alum dosages or incorrect dosing methods. No desirable secondary effects, such as reduction of BOD or suspended solids concentrations, were evident. (Bell-Cornell)

PROPERTIES OF SOLIDS AND LIQUIDS FROM STACKED MANURE,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
J. C. Converse, C. O. Cramer, G. H. Tenpas, and D. A. Schlough.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes--1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 432-436.

Descriptors: *Solid wastes, *Liquid wastes, *Separation techniques, *Waste storage, Chemical properties, Physical properties, Land application, *Farm wastes, Ponds, Farm lagoons, Waste treatment, Pollutant identification.
Identifiers: *Manure stacking, Detention ponds, Fly control.

Over winter storage of manure is receiving much emphasis because of concern for environmental quality and desire of the livestock operator to reduce drudgery of daily hauling. Stacking manure is most appropriate for stanchion type dairy facilities. Three years of data from three different stacking systems are summarized. The three systems include a covered bunker type storage for 32 cows, a platform type storage with swinging slide elevator for 28 cows and a platform type storage with a manure blower for 26 cows. Separation of liquids from solids was used in all three systems using drains and porous media. Liquids were stored in a detention pond for later application to crop land. Stacking was done year around with removal during spring and fall. Each system was evaluated for both winter and summer periods for solid and liquid volumes, physical and chemical characteristics of solids and liquids, stackability of manure and fly problems. Liquid runoff from stacks has high pollution potential and must be kept out of bodies of water. Liquid volumes varied with rainfall, amount of manure in storage and ability of liquid to separate from solids. A porous media is required between the manure and concrete floor of storage unit. Solid storage volume requirements were about 1.6 cu.ft./1000 lb. of live weight. Chemical fly control is ineffective and uneconomical for summertime stacking, but biological fly control is effective and economical. Stackability is dependent upon quantity of straw used and time of year stored, with wintertime stacking superior to summertime stacking. (See also W76-07154) (East Central)

ANALYSIS OF ORGANIC COMPOUNDS IN TWO KRAFT MILL WASTEWATERS,
Southeast Environmental Research Lab., Athens, Ga.
L. H. Keith.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-241 046, $7.00 in paper copy, $2.25 in microfiche. Report EPA-660/4-75-005, June 1975, 99 p, 45 fig, 7 tab, 42 ref, 2 append. 1BA027.

Descriptors: *Pollutant identification, Phenols, Mass spectrometry, *Pulp wastes, Gas chromatography, *Organic compounds, Water pollution sources.
Identifiers: *Paper mill pollution, Infrared spectroscopy, Fatty acids, Resin acids.

Wastewaters from two kraft paper mills in Georgia were sampled at various points in the waste treatment systems. Gas chromatography of the organic extracts and identification of many of the specific chemical components by gas chromatography-mass spectrometry provided a 'chemical profile' of the effluents. The mills, in different geographical locations, have very similar raw wastewater compositions but different wastewater treatments. In spite of these differences, the treated effluents are qualitatively similar in composition although the quantities of the various components differ. After two years the raw and treated effluents of both mills were re-sampled. Analyses showed that although concentrations of the organics varied, the same compounds are still present. (EPA)

SCIENTIFIC AND TECHNICAL ASSESSMENT REPORT ON VINYL CHLORIDE AND POLYVINYL CHLORIDE.
Environmental Protection Agency, Research Triangle Park, N.C. Office of Research and Development.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-249 461, $5.50 in paper copy, $2.25 in microfiche. Report EPA-600/6-75-004, December 1975. 115 p, 2 fig, 55 tab, 131 ref. 1AA001.

Descriptors: *Chlorides, Environmental effects, Public health, *Human diseases, Toxicology, *Pollutant identification, *Air pollution effects, *Path of pollutants.
Identifiers: Environmental pollution, Environmental distribution, *Vinyl chloride, *Polyvinyl chloride, Carcinogens, Angiosarcoma.

Vinyl chloride (VC) is a chemical of widespread industrial and commercial use. Occupational experience and experimental evidence strongly indicate that it is a carcinogen. Additionally, experimental evidence indicates that it may be a teratogen and mutagen. An increased incidence of liver angiosarcoma, excessive liver damage, and acroosteolysis has been reported among VC workers, and the frequency and severity of the liver pathology is related to the length of exposure. The principal route of exposure is thought to be air inhalation. Sources of increased importance for the general population include food and water. Tumors at multiple and diverse sites have been observed in all species of experimental animals tested for carcinogenicity by inhalation and ingestion of VC. An excess incidence of liver angiosarcoma was observed among VC/PVC (polyvinyl chloride) workers and reproduced in experimental animals with very similar pathology. Liver angiosarcoma was observed in two species of exprimental animals after inhalation exposures of VC at the lowest dose tested, 50 ppm (128,000 micro gram/m3), and after ingestion at 16 mg/kg. In addition to the health effects of VC, sources, distribution, and control technology are discussed. Emissions of VC from VC/PVC plants are estimated to exceed 100 million kilograms annually, about 90 percent of which is from PVC plants. Installation of currently available controls may be adequate to reduce VC emissions from VC/PVC plants in the order of 90 percent. (EPA)

WATER TREATMENT IN SQUID PROCESSING WASTES: I. WASTE WATER QUALITY, (IN JAPANESE),
Hokkaido Univ., Sapporo (Japan).
T. Motohiro, and S. Sugiura.
Bull Fac Fish Hokkaido Univ. 24(1), p 49-52, 1973.

Descriptors: *Pollutant identification, *Waste water treatment, Water quality, Nitrogen, Oxygen, Biochemical oxygen demand, Chemical oxygen demand, Chemical analysis.
Identifiers: *Japan(Hakodate), *Squid processing wastes.

A chemical analysis was made on the waste water collected at 6 squid processing plants in Hakodate (Japan) in order to obtain data on waste water quality for water treatment. The waste water contained soluble proteins and meat particles of which the BOD (biological oxygen demand) load was within the range from 70 ppm-12,000 ppm. The COD (chemical oxygen demand) load responded to 1/3-1/4 of the BOD load. Small contents of volatile basic nitrogen and volatile acids were measured in the sample water. The pH values varied from 6.1-7.0, depending on the pollutant levels.--Copyright 1974, Biological Abstracts, Inc.

BASIC FEATURES OF THE CHEMICAL COMPOSITION OF ORGANIC MATTER IN SEDIMENTS OF MARINE AND OCEANIC BASINS, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
O. K. Bordovskii.
Okeanologiya. 14(3), p 448-456, 1974.

Descriptors: *Organic matter, *Sediments, *Oceans, Lakes, Indian Ocean, Pacific Ocean, Antarctic Ocean, Chemical degradation, Plankton.
Identifiers: Bering Sea, Black Sea, Caspian Sea.

Studies were made of the group composition of organic matter in recent sediments of the Caspian, Black and Bering seas, the Eastern Antarctic, the northern part of the Indian Ocean and the Central Pacific, as well as the composition of plankton and corals as the major sources of organic matter. The investigations have shown that organic matter of recent marine and oceanic sediments belongs principally to the same group of matter as dispersed organic matter of fossil sedimentary rocks. The sedimentogenetic stage is characterized by the appearance of some new forms of organic matter - naphthene and aromatic hydrocarbons, asphaltenes, humic acids, insoluble matter, etc. All these components have their analogues in organic matter of fossil rocks and are lacking in the parent living matter. The changes of organic matter to the biostagnant state are accompanied by an accumulation of the cyclic structure of C.--Copyright 1975, Biological Abstracts, Inc.

THE DIRECT TITRATION OF WATER-SOLUBLE SULFIDE IN ESTUARINE MUDS OF MONTSWEAG BAY, MAINE,
Maine Univ., Walpole. Dept. of Oceanography.
E. J. Green, and D. Schnitker.
Mar Chem. 2(2), p 111-124, 1974.

Descriptors: *Maine, *Volumetric analysis, *Pollutant identification, Mud, *Sulfides, Estuaries, Bays, Dredging, Hydrogen sulfide, Dissolved solids, Sediments.
Identifiers: Anoxic conditions, *Montsweag Bay(Maine).

The use of an antioxidant buffer allows potentiometric titrations of dissolved sulfide, providing Cd or Pb rather than Ag is used as titrant. The method yields a measure of water-soluble as contrasted with acid-soluble sulfide. The vertical distribution of water-soluble sulfide was determined in 8 sediment cores from Montsweag Bay, Maine. Concentration profiles are characterized by 1 or 2 distinct maxima near the surface at depths ranging from 30 cm in areas of slow sedimentation, to 120 cm in areas of rapid sediment accumulation. Concentrations of sulfide at the maxima range from 1-8 mol S/m3 of in situ mud, or from 0.6-4 mmol S/l of pore water. The sulfide-rich upper portion of the mud is poorly consolidated and custardy in texture. Since they may be resuspended during proposed channel modifications, the oxidative demand of these sediments arising from their hydrogen sulfide content alone should be known. Using a conservative estimated mean of 5 mol sulfide/m3-mud, a mixing ratio of less than 30 volumes of O2 saturated seawater per volume of mud will render the water anoxic.--Copyright 1975, Biological Abstracts, Inc.

IMPROVED METHODS FOR THE MEASUREMENT OF DISSOLVED AND PARTICULATE ORGANIC CARBON IN FRESH WATER AND THEIR APPLICATION TO CHALK STREAMS,
Freshwater Biological Association, Wareham (England). River Lab.
C. D. Baker, P. D. Bartlett, I. S. Farr, and G. I. Williams.
Freshwater Biol. 4(5), p 467-482, 1974.

Descriptors: *Freshwater, *Analytical techniques, *Measurement, *Pollutants, *Carbon, Granules, Rivers, Organic matter, Pollutant identification.
Identifiers: Chalk streams, *Organic carbon ,Particulates, Heathland.

The development and use of an improved automatic system for the accurate measurement of dissolved organic carbon (D.O.C.) in fresh water is described. The method, which covers the range 0-25 mg l-1 D.O.C., is based on the oxidation of organic C to CO2 by UV radiation. The carbon dioxide produced is measured by a non-dispersive IR gas analyzer (I.R.G.A.). The I.R.G.A., is also used in the semi-automatic measurement of particulate organic carbon (P.O.C.) by a combustion method which allows very low concentrations to be measured using samples of 200 ml or less. Results of surveys of 2 river systems indicate that D.O.C. concentration of less than 2.0 mg l-1 are typical in unpolluted chalk streams D.O.C. concentrations of streams draining acid heathland were significantly higher (3-5.5 mg l-1). D.O.C. concentration was found to increase rapidly during a spate, in a river draining aread of mixed underlying geology. The throughput of D.O.C. during the 25-50 spates which occur annually in the river could amount to 20-30% of the annual flux of D.O.C.--Copyright 1975, Biological Abstracts, Inc.

EXPERIMENTAL STUDIES OF WING-WALL MIXING CONTROL,
Illinois Univ. at Urbana-Champaign. Dept. of Civel Engineering.
W. H. C. Maxwell, and M. Demissie.
Illinois Water Resources Center, Urbana, Research Report No. 110, February 1976. 71 p, 45 fig, 6 tab, 11 ref. OWRT B-083-ILL(1) 14-31-0001-4079.

Descriptors: *Control structures, *Diffusion, *Mixing, *Outlet works, *Thermal pollution, *Waste dilution, Discharge(Water), Heated water, Outlets, Pollution abatement, Jets, Mixing, Flow control, Flow rates.

Detailed velocity traverses are presented for shallow submerged slot jets without lateral confinement. With wing-walls in place maximum velocities and temperatures were traced for both unheated and heated discharges. These tests were repeated for various wing-wall crest elevations and wing-wall lengths. For the wing-wall tests a typical Reynolds number based on slot width was 400,000 and a typical densimetric Froude number based on slot width was 40. Some flow combinations were unstable and tests were conducted to delineate the limits of stability. The tests demonstrate that flow patterns may be controlled using controlled flow over wing-wall crests. A simple design procedure making use of the data is illustrated.

Descriptors: *Radioecology, *Radioisotopes, *Water pollution sources, Freshwater, Sea water, Fish, Algae, Migration, Distribution, *Path of pollutants, Lakes.
Identifiers: Accumulation coefficients.

This collection reflects radioecological studies on the accumulation of Sr90 in lakes of different trophic conditions. Achievements and directions in the field are described. Behavior of radionuclides in landscapes surrounding water reservoirs and their migration in rivers and lakes; the fate of radionuclides entering freshwater reservoirs; their accumulation and that of their nonisotopic carriers by hydrobionts; and migration and distribution of emitters among water, soil and biomasses are included. Other articles include the problems of the mechanisms and routes of entry of radionuclides into organisms. (See W76-06862 thru W76-06903) (Chilton-ORNL)

ON SR90 MIGRATION IN LAND FRESH WATER,
Institute of Experimental Meteorology, Moscow (USSR).
T. I. Bobovnikova, and K. P. Makhon'ko.
In: Radioecology of Water Organisms. Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 16-19, 1 fig, 2 tab, 4 ref.

Descriptors: *Radioecology, *Migration, *Strontium, Radioisotopes, Distribution, Runoff, Leaching, Freshwater, *Path of pollutants.

Radionuclides deposited on the surface of the land migrate either into the soil or with surface water runoff and their amount depends on the amount of atmospheric precipitation. For Sr90, this relationship is determined by a formula based on the disturbance of Cs137/Sr90 ratio in the soil. The parallel processes of sorption and desorption which bring about equilibrium between the concentrations of nuclides in the water and in the surface layer of the bottom sediments is considered. Results of the measurement of vertical distribution of Sr90 in bottom sediments in rivers is presented. A formula is given for calculating the amount of Sr90 washed out of the soil and carried away in one year. (See also W76-06861) (Chilton-ORNL)
W76-06864

EFFECTS OF SOME NATURAL FACTORS ON THE TRANSITION OF SR90 FROM THE SOIL COVER TO SURFACE WATERS,
Institut Prikladnoi Geofiziki, Leningrad (USSR).
V. V. Pisarev, and I. S. Tsybizov.
In: Radioecology of Water Organisms. Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 20-24, 2 figs, 1 tab, 3 ref.

Descriptors: *Radioecology, *Strontium, *Migration, Soil water movement, Soil contamination, Radioisotopes, Effects, Runoff, Leaching, *Path of pollutants.

The purpose of this work was to study the effects of a number of natural factors, such as the age and level of soil contamination and the depth of water formations (local accumulation of rain water and snow melt water), as well as the length of intervals during successive washing of soils imitating surface flow of Sr90, on the amount of Sr90 migrating from the soil into surface waters. The experiments were conducted on experimental virgin soil areas on the surface of which Sr90 was deposited over a period of approximately ten years. The studies indicated that the age of soil contamination does not affect the transition of Sr90 into surface waters. A sharp decrease in the concentration of Sr90 was seen in a time period corresponding to a runoff of 300 liters of surface water. Sr90 concentration in shallow water formations did not depend on their depths. (See also W76-06861) (Chilton-ORNL)

RADIOACTIVE ISOTOPES IN THE SYSTEM WATER--FRESHWATER PLANTS,
Akademiya Nauk SSSR, Sverdlovsk. Inst. of Plant and Animal Ecology.
N. V. Kulikov.
In: Radioecology of Water Organism. Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p25-31, 44 ref.

Descriptors: *Radioecology, *Aquatic plants, *Freshwater, Radioactivity effects, Strontium, Trophic levels, Reservoirs, Radioisotopes.
Identifiers: *Accumulation coefficients.

A review of studies on the accumulation of radioactive elements by freshwater plants is given. Comparative studies were done on the accumulation of Co, Zn, Zr, Nb, and Ru radionuclides by freshwater plants in reservoirs with running and still water. The obtained data indicated that the accumulation coefficients of radionuclides in plants in reservoirs with running water reach smaller values than in plants in a still water system. It was established that the accumulation coefficients of radionuclides in plants growing in a dystrophic water body was noticeably higher than in an oligomesotrophic water body. (See also W76-06861) (Chilton-ORNL)
W76-06866

SR90 IN WATER, BOTTOM, AND WATER ORGANISMS IN LATVIAN LAKES OF VARIOUS TYPES,
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.
Y. Y. Sloka, Z. K. Kalninya, D. R. Vadzis, and M. P. Leinerte.
In: Radioecology of Water Organisms, 1973. Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Bioceneses, p 32-34, 3 ref.

Descriptors: *Radioecology, *Radioactivity effects, *Strontium, *Trophic levels, Aquatic life, Bottom sediments, Plankton, Benthos, Migration, *Path of pollutants, Lake sediments.
Identifiers: *Accumulation coefficients.

Accumulation of Sr90 and stable Sr in water, bottom soils, and hydrobionts of three lakes were compared. Accumulation coefficients of Sr90 in the plankton of the mesotrophic and eutrophic lakes were both close to 40 while the accumulation coefficient of the dystrophic lake was approximately 300. Among zoobenthos organisms, the highest Sr90 content was in the shells of mollusks at an accumulation coefficient 8-30 times higher that in the soft tissues of mollusks. It was established that in aquatic plants, the accumulation coefficients vary greatly depending on the species and also on the season and the type of lake. Accumulation of Sr90 in the bottom soil depends on the nature of trophicity of the lake. (See also W76-06861) (Chilton-ORNL)
W76-06867

THE ROLE OF AQUATIC PLANTS IN THE MIGRATION OF SR90 IN SOME WATER RESERVOIRS OF THE LITHUANIAN SSR,
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.
N. F. Dushauskene-Duzh, Y. P. Marchyulenene, V. B. Nyanishkene, Y. Yankavichyute, and K. K. Yankyavichyus.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 35-42, 2 fig, 5 tab, 8 ref.

Descriptors: *Radioecology, *Aquatic plants, *Strontium, Plankton, Algae, Freshwater, Sea water, Migration, Radioisotopes, *Path of pollutants, Reservoirs.
Identifiers: *Accumulation coefficients.

Accumulation and removal of Sr90 by phytoplankton and freshwater and seawater algae were studied. Sr90 in a chloride form was introduced into aquariums at a rate of 0.00001 curie/liter. Studies showed that the most intensive accumulation of Sr90 in phytoplankton occurred during the first hours of its stay in the water containing radionuclides with the equilibrium level being reached on the 4th-8th day. Equilibrium level in the algae studied was generally attained in the same time. The most widespread aquatic plants yielding a greater biomass accumulated Sr90 well. SR90 DISTRIBUTION IN WATER AND BOTTOM SEDIMENTS OF LATVIAN LAKES,
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.
D. R. Vadzis, and A. K. Kalninya.
In: Radioecology of Water Organisms, Vol. 2 Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 53-57, 1 fig, 2 tab, 5 ref.

Descriptors: *Radioecology, *Strontium radioisotopes, *Water pollution sources, *Bottom sediments, Lakes, Trophic levels, Distribution, *Path of pollutants, Lake sediments.

Investigations showed that Sr90 concentrations in lake water increased from spring to the end of the vegetative period. Distribution of Sr90 differed between the water the upper layer of bottom sediments. 65-88% of the total amount of radioactive strontium was contained in the bottom sediments of ultraeutrophic and dystrophic lakes with only 12-35% being in the water. In the deep mesotrophic lake and the medium-depth eutrophic lake, the bottom sediments contained only 9-25% of the total amount of Sr90 and the water contained 75-91%. SORPTION OF SR90 BY BOTTOM SEDIMENTS OF A FRESHWATER LAKE,
Akademiya Nauk SSSR, Sverdlovsk, Inst. of Plant and Animal Ecology.
S. A. Lyubimova.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 58-61, 1 fig, 1 tab, 4 ref.

Descriptors: *Radioecology, *Bottom sediments, *Strontium radioisotopes, *Cesium, Radioisotopes, Migration, Distribution, Freshwater, Lakes, Soils, Lake sediments.
Identifiers: *Accumulation coefficients.

The highest accumulation coefficients for both Sr90 and Cs137 were found to be those of peat and clay soils. For almost all soils, higher accumulation factors and more stable fixation of Cs137 are observed in comparison with Sr90. This was explained by the greater mobility of Sr90 and, consequently, differences in the forms in which radionuclides were present in the soils. (See also W76-06861) (Chilton-ORNL)

N. G. Morozova.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 70-73, 1 tab, 1 fig, 3 ref.

Descriptors: *Radioecology, *Thorium, *Radium, *Bottom sediments, Radioisotopes, Lakes, Freshwater, Lake sediments.

The content of radioactive elements in the bottom sediments of two lakes was found to be the same as in mineral soils and sedimentary deposits with variations with the limits of one order. Extreme values of Th and Ra differed respectively by 10-12 times for air-dry matter and 11-14 times for calcined matter. Bottom sediments of the two lakes had almost equal geochemical parameters with respect to Ra/Th ratio and content. In littoral area deposits the ratio was close to 3, in profundal deposits-3, and in organogenic deposits-2. (See also W76-06861) (Chilton-ORNL)

G. B. Pitkyanen, and N. G. Safronova.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 85-88, 1 tab, 1 fig, 7 ref.

Descriptors: *Radioecology, *Standing waters, *Lentic environment, *Strontium, Reservoirs, Water, Self-purification, Bottom sediments.

The goal of this study was to determine general regularities in the behavior of Sr90 in an experimental still water reservoir after a single aerosol contamination of the reservoir. The process of self-purification under these circumstances was a long one. Due to the redistribution of Sr90 over the profile of bottom deposits, the concentration of the radionuclide in water decreased by 2-3 times over ten year period. (See also W76-06861) (Chilton-ORNL)

M. M. Saurov, K. B. Korotkov, G. I. Gneusheva, G. P. Novoselova, and T. A. Tribunskaya.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, (1973). p 105-109, 3 tab, 3 ref.

Descriptors: *Radioecology, *Phosphorus, *Water pollution, Radioisopopes, Fish, Reservoirs.

The accumulation of P32 by some species of freshwater fish was studied to assess the role of fish as possible suppliers of the radionuclide to human organisms. The accumulation of P32 was found to depend upon the fish species, its age, and the degree of enrichment of the organs and tissues with stable P. From a contaminated reservoir, the accumulation of P32 in fish was found to be 40-200 times that of the water. (See also W76-06861) (Chilton-ORNL)

In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 115-118, 3 tab.

Descriptors: *Radioecology, *Water pollution, Chemical wastes, Radioisotopes, Freshwater, *Reservoirs, Radium, Cesium, Cobalt, Chemicals, Toxicity, Pollutant identification.

Experiments were conducted on the effects of one-time separate contamination of experimental water reservoirs with Ra226, Cs137, Co60, hexamethylene diamine, methyl mercury and cobalt under identical conditions. When the habitat was contaminated by the radioactive substances, no deaths of any species of the experimental aquatic organisms occurred. The influence of the chemical substances revealed various degrees of toxicity. Cobalt and methyl mercury had a deadly effect on all species while hexamethylene diamine had an insignificant effect only on the infusorians. (See also W76-06861) (Chilton-ORNL)

ARTIFICIAL RADIOACTIVITY OF SEA WATER AND FOOD HYDROBIONTS OF THE WORLD OCEAN,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kaliningrad (USSR).
S. A. Patin, and A. A. Petrov.
In:Radioecology of Water Organisms, Vol 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 119-124, 2 tab, 2 fig, 14 ref.

Descriptors: *Radioecology, *Radioactivity, *Sea water, *Aquatic life, Strontium, Cesium, Water pollution, Oceans.

Contamination of the World Ocean waters was compared with the levels of the content of long-lived radionuclides in various inland seas. Two characteristic trends were observed from the data. One of them reflects some decrease in the concentrations of Sr90 and Cs137 in oceanic waters, particularly in the Pacific Ocean, and the other reflects an increase of Sr90 in inland seas. A correlation was found between the content of radionuclides in water and in hydrobionts. (See also W76-06861) (Chilton-ORNL)

SR90 IN THE WATER-ATMOSPHERE INTERFACE,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
V. I. Timoshchuk.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 125-128, 1 tab, 14 ref.

Descriptors: *Radioecology, *Strontium, *Air-water interface, Radioisotopes, Fallout, Air pollution.

Under conditions of a calm or slightly agitated water surface, 20 meters from shore at a depth of 2.7-3.0 meters, the values of Sr90 concentration in the interface were found to be 60-90% higher than at the bottom. It was concluded that this effect of higher Sr90 concentration in the water-air interface was a result of the processes developing in the surface layer and not of atmospheric fall-out of radionuclides. (See also W76-06861) (Chilton-ORNL)
W76-06888

SR90 AND CS137 IN SURFACE WATERS OF THE BALTIC, NORTH, IRISH, AND NORWAY SEAS,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kaliningrad (USSR).
N. I. Buyanov, and Y. M. Petrov.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 129-132, 2 tab, 1 fig, 9 ref.

Descriptors: *Radioecology, *Strontium, *Cesium, Surface waters, *Oceans, Radioisotopes, Runoff, Fallout.
Identifiers: *North Sea, *Irish Sea, *Norway Sea.

Concentrations of Sr90 and Cs137 in seas of the Northeastern Atlantic Oceans showed a gradual increase toward the surfaces of the Baltic, North, and Norway seas. Concentrations in surface and littoral waters were found generally to be higher than in waters with a higher salinity. These results stress that the main role in the formation of the concentration field of radionuclides, along with effluent waters, belongs to shore runoff rather than to atmospheric fallouts. (See also W76-06861) (Chilton-ORNL)
W76-06889

CS137 AND SR90 IN THE SEA OF AZOV,
Azovskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Rostov-na-Donu (USSR).
O. M. Aleksanyan.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 133-135, 6 ref.

Descriptors: *Radioecology, *Strontium, *Cesium, Surface waters, *Oceans, Radiosiotopes.
Identifiers: *Sea of Azov.

The concentrations of Sr90 and Cs137 in the Azov waters were found to vary widely depending upon the region and water salinity. This was explained

by spatial and temporal variations in the content of the elements, as well as by the pecularity of hydrodynamic regime of surface waters. (See also W76-06861) (Chilton-ORNL)

WATER QUALITY IN VICINITY OF FENTON HILL SITE, 1974,
Los Alamos Scientific Lab., N.Mex.
W. D. Purtymun, W. H. Adams, and J. W. Owens.
Available from the National Technical Information Service, Springfield, Va., 22161, as LA-6093, $3.50 in paper copy, $2.25 in microfiche. Report LA-6093, September 1975. 16 p, 3 tab, 4 fig, 6 ref. W-7405-ENG-36.

Descriptors: *Water quality, *Environmental effects, Water pollution effects, Uranium, New Mexico, Data collections.
Identifiers: *Environmental impact studies.

Data on the quality of water from the Fenton Hill Site vicinity were collected and analyzed during 1974 as part of a continuing program of environmental impact studies. Activities at the Fenton Hill Site in Jemez Mountains are involved in geothermal experimental studies. Water was collected and analyzed from nine surface water stations, eight ground water stations, and the drilling operations at the site. Surface water in Jemez River contained a significant quantity of sodium and bicarbonate as did ground water from the Cenozoic Volcanics. Water in the main zone of saturation penetrated by test hole GT-2 was highly mineralized. Water in the lower section of the test hole contained a higher concentration of uranium, characteristic of water in contact with granite rock. (Chilton-ORNL)

Identifiers: Lake Michigan survey, Bacteriological quality, *Lake bed survey, Fecal coliform, Cyanides, Total dissolved minerals, Phthalates.

The Illinois Environmental Protection Agency reported in this report the results of the Lake Michigan Water Quality and Lake Bed Survey for 1973. The survey is conducted on a continuing basis to evaluate the ecology and the chemical and bacteriological quality of Lake Michigan. Data on lake water quality were obtained from: (1) shore water sampling sites, (2) municipal water filtration plants, and (3) lake monitoring stations located 5 mi offshore. Tabulated results of the analyses were given. Specific problems identified included concentrations of ammonia, phosphorus, and fecal coliform which continue to be found at undesirable levels at a large number of sampling stations. Samples of the lake bed identified areas of pollution at some near-shore stations. Local problems at times have developed and resulted in the closing of some Lake County beaches. (Henley - ISWS)

RADIOCHEMICAL POLLUTION FROM PHOSPHATE ROCK MINING AND MILLING,
National Field Investigations Center Denver, Colo.
J. V. Rouse.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 65-71. 7 ref.

Descriptors: *Mining, *Phosphates, *Pollutants, *Florida, Radium radioisotopes, Radioactivity, Air pollution, Water pollution, Radioactive wastes, Spoil banks, Slime, Solid wastes, Waste dumps, Gypsum, Groundwater, Infiltration,

Mineral industry, Mills, Industrial wastes, Industrial water.

Phosphate mining and milling is a major segment of the U.S. mining industry. The United States produces 45% of the world's supply of phosphate fertilizer. This mining and milling of phosphate rock has been responsible for major water pollution problems of a conventional nature in the past. Recent data indicate that the industry is also responsible for major, unrecognized radiochemical pollution of water and air, and the generation of radioactive solid waste. The untreated liquid effluents from phosphoric-acid plants are 30 times the Maximum Permissible Concentration for radium-226. The byproduct gypsum generated by the industry contains approximately 25 picocuries of radium-226 per gram. Use of this material for building products would expose the population to radon decay products. Seepage of contaminated water from process ponds has contaminated large areas of groundwater. Treatment and stabilization measures exist to control the surface water discharge and the solid waste. Problems still exist with respect to seepage. Failures of slime ponds constitute a massive release of radium, measured in curies, to the aquatic environment. (See also W76-06938) (Sims - ISWS)

In: Water Resources Problems Related to Mining; Proceedings No. 1, JUne 1974. American Water Resources Association, Minneapolis, Minnesota, p 123-137. 8 fig, 3 rab, 9 ref.

Descriptors: *Mining, *Mills, *Water pollution source, *Spoil banks, *Colorado, Groundwater, Runoff, Streams, Water quality, Mineral industry, Coal mines, Strip mines, Mine wastes, Pollutants, Pollutant identification, Chemical analysis.

An investigation into the pollution potential and current water quality degradation attributable to mine and mill spoils was conducted at two sites in Colorado. The chemical characteristics of the spoils were determined and correlated with the chemical makeup of water which has passed through and over the spoils. Monthly in-stream water quality measurements were made upstream and downstream of the spoils to determine the degree of water quality degradation. Soluble salts, principally calcium, magnesium, sodium, and sulfate, were found to be the major contaminants. (See also W76-06938) (Sims - ISWS)

COAL MINING AND ITS EFFECT ON WATER QUALITY,
Ohio Univ., Athens. Dept. of Geology.
M. U. Ahmad.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 138-148. 1 fig, 1 tab, 27 ref.

Descriptors: *Mining, *Coal mines, *Water pollution source, *Acid mine water, Mine drainage, Water quality, Groundwater, Streams, Surface waters, Pyrite, Acids, Chemistry, Chemical reactions, Strip mines, Drift mining, Pollutants.

Coal mining has seriously degraded the water quality of streams and some underground aquifers in Appalachia and other parts of the U.S.A. In the Appalachian region, about 6,000 tons of sulfuric acid are being produced daily through oxidation of pyrite. The mining of coal has at the present time seriously distrubed this interrelated hydrological system in over 11 million acres of land mined for coal in the U.S.A. Strip mining oftern lowers the water table in the undisturbed land by increasing the surface area over which water can be lost through seepage face, subsequent leaching of the pyrite, and then the introduction of acid and salts into the streams of the mined area. Large areas of the stripped land can not supply good quality water. Rural water supplies in coal mining districts are being seriously threatened by stripping. In areas where the overburden is thick, underground mining is practiced. Large amounts of coal are left in these mines and oxidation is going on. The primary vehicle of transport for the oxidation product is the flowing groundwater. Hundreds of unnatural springs are discharging highly acidic water into our streams. Fifty years of coal mining have left serious scars on our land and polluted 13,000 miles of streams. No effective method has yet been developed to abate this problem. (See also W76-06938) (Sims - ISWS)

GROUND WATER LEACHING OF JIG TAILING DEPOSITS IN THE COEUR D'ALENE DISTRICT OF NORTHERN IDAHO,
Idaho Univ., Moscow.
P. N. Norbeck, L. L. Mink, and R. E. Williams.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 149-157. 10 fig, 4 ref.

Descriptors: *Mining, *Spoil banks, *Groundwater, *Water pollution sources, *Idaho, Mineral industry, Heavy metals, Mine wastes, Acids, Salts, Acid mine water, Lead, Zinc, Metals, Rivers, Alluvial channels, Sediments.
Identifiers: *Coeur d'Alene Mining District(Idaho), Tailing deposits.

The Coeur d'Alene Mining District of northern Idaho has been world famous for its production of lead, silver, zinc and antimony for over 80 years. The age of the district and the large-scale production during this period have resulted in many environmental impact problems within the district. Extensive deposits of jig tailings produced near the turn of the century are now affecting the quality of ground and surface waters throughout the basin. The major problems are the result of low pH and high heavy metal concentrations. Investigations of water table configuration, aquifer boundaries, ground and surface water quality and the geometry and extent of old tailings deposits have revealed that when groundwater is exposed to the old tailings, bacteriological and chemical leaching of heavy metal occurs. Groundwater can encounter tailings if this material is dumped at sites which seasonally lie below shallow groundwater flow systems or through artificial recharge by tailing ponds. Wells sampled throughout the valley indicated significantly high concentrations of heavy metals present within the groundwater. In some areas of groundwater discharge statistically significant increases of heavy metal concentrations were noted within surface waters of the area. Techniques designed to solve the groundwater and surface water pollution problem of the area rely heavily on control of the surface of the phreatic zone. (See also W76-06938) (Sims - ISWS)

GROUND-WATER MOVEMENT THROUGH AN ABANDONED TAILINGS PILE,
Idaho Bureau of Mines and Geology, Moscow.
D. R. Ralston, and A. G. Morilla.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 174-183. 7 fig, 4 ref. USBM H023065.

Descriptors: *Groundwater movement, *Spoil banks, *Mining, *Idaho, Mineral industry, Mine wastes, Piezometry, Piezometers, Instrumentation, Potentiometric level, Permeability, On-site data collections, On-site investigations.
Identifiers: Coeur d'Alene Mining District(Idaho), Tailing deposits.

Water quality standards have resulted in the construction of a number of tailings ponds in the Coeur d'Alene Mining District in northern Idaho. A number of ponds have been filled and abandoned in the district in the last several years. The abandoned tailings piles contain significant concentrations of heavy metals that may enter the ground and surface water in the valley by leaching of precipitation through the pile material. An abandoned tailings pile near Kellogg was selected as a study area. It is located on permeable alluvial material on the flood plain of the South Fork of the Coeur d'Alene River. A groundwater mound is evident under the east portion of the pile. It is possible that a low permeability zone formed by compaction near the bottom of the east side of the pile may be responsible for the mound. The dominant direction of flow under the eastern side is horizontal while a more marked downward component of flow is present in the west pile. Downward drainage in the east side of the pile is more limited than in the western portion. Precipitation is the only source of groundwater recharge to the tailings pile. THE RELATION BETWEEN WATER CHEMISTRY AND MINERAL ZONATION IN THE CENTRAL CITY MINING DISTRICT, COLORADO,
Colorado School of Mines, Golden. Dept. of Chemistry; and Colorado School of Mines, Golden. Dept. of Geochemistry.
T. R. Wildeman, D. Cain, and R. A. J. Ramiriz.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 219-229. 2 fig, 4 tab, 22 ref.

Descriptors: *Mine drainage, *Water chemistry, *Mineral industry, *Colorado, Acid mine water, Mining, Chemical analysis, Chemistry, Pollutants, Pollutant identification, Water pollution sources, Pyrite, Rocks, Geology, Geochemistry, Metals, Metallurgy, Groundwater.
Identifiers: *Central City Mining District(Colo).

The analyses of water draining from eight mines within the Central City mining district, Colorado, were reported. The Central City district is a complex sulfide mineral deposit classified as a mesothermal type. There is a well-defined concentric zoning of the ore minerals in the district consisting of a central zone of pyrite veins surrounded by a peripheral zone of shalerite-galena veins, with an intermediate zone between the other two zones. It was found that concentrations of the base metals in the mine drainage change in a direct way within the zonation. Fe, Mn, Zn, Cu, Cd, and Pb are in highest concentration in drainages from the central zone and in lowest concentrations in drainages from the peripheral zone. It was suggested that the cause of this zonal variation is the weathering of pyrite which is in greatest abundance in the central zone, and which releases Fe(III) and H(+) which promote the dissolution of the other base-metal sulfides. So far, samples have been collected in the summer, fall, and winter; there are no significant seasonal variations in the

water chemistry. (See also W76-06938) (Sims - ISWS).

THE IDEFJORD: A DESTROYED MARINE ENVIRONMENT, (IN SWEDISH),
B. I. Dybern.
Fauna Flora 67(2), p 90-103. 1973.

Descriptors: Bacteria, Coliforms, Marine environment, Fish, Fjords, Invertebrates, Light, Oxygen, Sulfur, Salmon, Sewage, Water pollution sources, Thermocline.
Identifiers: Ide, Norway, Sweden.

The Idefjord is situated at the border between Norway and Sweden. Two sills in the outer part impede water exchage with the sea. The Fjord is very heavily polluted by untreated sewage and insufficiently treated wastes from a paper and pulp mill at Halden, Norway. Fresh water supply comes from 2 small rivers. This makes the surface water very brackish, while the deeper water layers have a rather high salinity. A halocline is formed between the 2 water layers, and the deep water easily stagnates. The temperatures of the deeper water remain low during the whole year. In summer the surface water is warmed up and a thermocline is formed between the 2 layers. A rich supply of organic substances depletes O2 levels, especially in the deeper water layers. Toxic H2S is formed and the bottoms are covered with partially decayed organic material. O2 deficit conditions may also arise in the surface water. The waste water from Halden is dark-colored and spreads as a thin layer over the whole surface of the fjord, impeding light penetration. The bad light and O2 conditions are mainly responsible for the almost total absence of plant and invertebrate life in the fjord. Stable populations exist only in the outermost and innermost parts. There are very few fish. Salmon migrate through the fjord to or from 1 of the rivers, but many of them die on the way. The content of coliform bacteria in the surface layer is high. The bottom water contains sulfur bacteria and S is deposited in the bottom sediments. As late as 40-60 yr ago the fjord contained a bottom fish fauna in all parts. The pollution conditions worsened especially in the 1950's and 1960's. They are now an international problem and negotiations are carried out between Sweden and Norway on how to restore the natural conditions. The best way is to build treatment plants at Halden.--Copyright 1975, Biological Abstracts, Inc.

PHOSPHORUS MODEL OF MUSKEGON WASTEWATER SYSTEM,
Robert S. Kerr Environmental Research Lab., Ada, Okla. Water Quality Control Branch.
C. G. Enfield, and L. E. Leach.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol. 101, No. EE6, p 911-916, December, 1975. 6 fig, 5 ref.

Descriptors: *Model studies, *Waste water treatment, *Phosphorus, Laboratory investigation, Kinetics, Soils, Sorption, Water pollution effects, Computers, Waste disposal.
Identifiers: Land application, Phosphorus removal, Muskegon(Mich).

A model has been developed for the Muskegon County, Michigan, land application waste water treatment system, simulating vertical movement and sorption of phosphorus. The purpose of the investigation was to predict how the system would function with respect to the applied phosphorus based on: proposed operating conditions, the constraints of the mathematical model, and laboratory measurements of the kinetics of phosphorus sorption by Muskegon soils. Computer analysis provided six profiles (three operating conditions) for the responses of Rubicon Sand and Roscommon-Au Gres Sand to waste water application. For each soil type, predicted applications of phosphorus concentrated at 5.0 mg/liter at a rate of 0.0298 cm/hr, 5.0 mg/liter at a rate of 0.0595 cm/hr and 3.56 mg/liter at a rate of 0.0595 cm/hr were modelled. From the predictions, Rubicon sand appeared to be more effective in removing phosphorus. For the model, it was assumed that waste water would be applied at a constant rate throughout the year and that the influence of vertical variability of the soils was not considered. If the Muskegon system were to be operated under these model constraints, no problems in phosphorus removal should occur for the first 30 years of operation. (Kramer-FIRL)

DISTRIBUTION OF BDELLOVIBRIO BACTERIOVORUS IN SURFACE WATERS AND ITS ROLE IN SELF-PURIFICATION PROCESSES, (IN RUSSIAN),
Kuybyshevskii Nauchno-Issledovatelskii Institut Epidemiologii, Mikrobiologii i Gigieny (USSR).
S. N. Bukovskaya.
Gig Sanit 12, p 86-88, 1974.

Descriptors: *Self purification, Water purification, *Distribution, *Path of pollutants, *Bacteria, E coli, Water supply, Wastes, Salmonella, Surface waters.
Identifiers: Aeromonas, Anaerobes, *Bdellovibrio-bacteriovrous, Enterococci, Salmonella-decumanicidum, Saprophytes.

A study was done to detect Bdellovibrio bacteriovorus along a 350-km stretch of a river used widely as the main source of domestic and industrial water supply and which is a receiver of domestic and industrial wastewaters. The bacteria was isolated from 54.9% of the water samples. (Saprophytes, enterococci, anaerobes and Aeromonas were also isolated.) Fifty-eight strains of B. bacteriovorus were isolated: 32 on Escherichia coli 106 and 26 on Salmonella decumanicidum. In this river B. bacteriovorus may participate in self-purification of waste from fecal microflora.--Copyright 1975, Biological Abstracts, Inc.

HYDROCHEMICAL REGIME AND CHEMICAL COMPOSITION OF OLIGOTROPHIC BOG WATERS,
I. L. Kalyuzhnyy, and L. Ya. Levandovskaya.
Soviet Hydrology, Selected Papers, No. 5, p 300-314, 1974. 2 fig, 5 tab, 7 ref. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No. 222, p 99-118, 1974.

Descriptors: *Bogs, *Water chemistry, *Water pollution sources, Precipitation(Atmospheric), Chemistry, Ions, Cations, Pollutants, Pollutant identification, Water analysis, Path of pollutants, Water properties, Trace elements, Peat, Soils, Groundwater.
Identifiers: *USSR.

Bog waters that enter rivers have an injurious effect on hydraulic installations on rivers and reservoirs. The hydrochemical regime of oligotrophic bog waters were investigated on the basis of analysis and generalization of observational data on bog water chemistry obtained at specialized bog stations of the Main Hydrometeorological Service Administration. Investigations showed that despite the different locations of the oligotrophic bogs studied, their hydrochemical regime and the chemical composition of their waters have many similar features and depend on hydrometeorological factors. The total content of minerals in the waters of these bogs may vary from 8-10 to 50-70 mg/liter. The waters of highmoor bogs are distinctly sulfatic almost throughout the year and Ca(2+) predominates among the cations. The highest mineral content of the waters in all bogs is observed before the flood, when it reaches 60 mg/liter. This is favored by freezing, when the concentration of the ions increases because of their displacement from the freezing solution. The lowest mineral content is observed during the spring flood. The coefficient of variation of the total mineral content increases from the center of a bog to its periphery, and its value varies throughout the year. (Sims-ISWS)

SEDIMENTATION RATES AND MEAN RESIDENCE TIMES OF STABLE PB AND 210PB IN LAKE WASHINGTON, PUGET SOUND ESTUARIES AND A COASTAL REGION,
Washington Univ., Seattle. Coll. of Fisheries; and Washington Univ., Seattle. Lab. of Radiation Ecology.
W. R. Schell.
Available from the National Technical Information Service, Springfield, Va., 22161 as RLO-2225T14-6 $4.00 in paper copy, $2.25 in microfiche. Report RLO-2225-T14-6, June 1974. 40 p, 5 fig, 14 ref. AEC AT(45-1)-2225-TA-14, EPA R-800357.

Descriptors: *Lead, *Sediments, *Coasts, *Washington, Sedimentation, Sedimentation rates, Estuaries, Lakes, Bays, Rivers, Heavy metals, Pollutants, Water pollution, Pollutant identification, Lead radioisotopes, *Path of pollutants.
Identifiers: *Lake Washington(Wash), *Puget Sound(Wash), *Frazer River(Wash), Residence time.

Core and water samples have been analyzed for 210Pb and Pb in Lake Washington and the marine environment of Puget Sound. A systematic evaluation of geochemical process has been made by measuring the sedimentation rates, the density, and the water concentration to evaluate the atmospheric and water contributions of 210Pb and Pb to sediments. The mean residence time was evaluated in the several systems. In Lake Washington the mean residence time of Pb and 210Pb was 70-80 days; in the dynamic system of Bellingham Bay the mean residence time was 10 days; in the coastal station the mean residence time was 75 days; at the mouth of the Frazer River the mean residence time was estimated at 80-113 days. The sediments reflect the total input from aeolean and pluvial sources. In Lake Washington, the time history is shown by the three sedimentation rates measured: 0.58 mm/year before 1870, 4.5 mm/yr between 1890-1916 and 3.1 mm between 1916 and 1972. The stable lead concentrations in the sediments gave information on the anthropogenic input to Lake Washington which correlated well with the time history determined by sediment dating. (Sims - ISWS)

PHOSPHATE, SILICATE, NITRATE, AND AMMONIA IN LINDASPOLLENE, A NORWEGIAN LAND-LOCKED FJORD,
Bergen Univ. (Norway). Biological Station.
C. Lannergren.
Sarsia, Vol. 59, p. 53-66, 1975. 11 fig., 2 tab., 14 ref.

Descriptors: Chemical properties, *Fjords, *Phosphates, *Silicates, *Nitrates, *Ammonia, Diatoms, Limiting factors, Surface waters, Nitrites, Phytoplankton, Hypolimnion, Lake sediments, Denitrification, Europe, Phosphorus, Nitrogen, Runoff, Sewage effluents, Dissolved oxygen.
Identifiers: *Lindaspollene(Norway), North Sea.

The surface waters of the small land-locked fjord contained phosphate, nitrite/nitrate, and ammonia concentrations similar to those in the North Sea. The silicate concentration was higher in the winter. Nitrogen and silicates limited phytoplankton production. Phosphates, silicates, and ammonia accumulated (in bottom waters). Phosphates were liberated from sediment. Due to denitrification, the inorganic combined nitrogen content decreased. Nutrient replenishment from bottom or adjacent waters after plant growth was more important than nutrient transport from land. In January and December, bottom water showed an increase of 0.2 ton phosphate phosphorus and 1.7 ton silicate. The nitrite/nitrate nitrogen concentration decreased 1.6 ton, but was partly compensated for by an increase of 0.6 ton ammonia nitrogen. The estimated contributions from freshwater runoff were: nitrate nitrogen 2.0, phosphate phosphorus 0.2, silicates 100, and ammonia nitrogen 0.7 tons/year. Domestic sewage supplied about 0.3 ton phosphate phosphorus and 1.5 tons nitrate nitrogen. Large amounts of nutrients were probably stored in the sediment in undissolved and reduced forms, so fast oxygen consumption and increased nutrient release from sediments can be expected when bottom water is exchanged with oxygen-rich water. THE ENVIRONMENTAL IMPACT OF FERTILIZERS,
Agricultural Research Service, Fort Collins, Colo.
F. G. Viets.
CRC Critical Reviews in Environmental Control, Vol. 5, No. 4, p. 423-453, 1975. 10 tab., 103 ref.

Descriptors: *Fertilizers, *Beneficial use, *Environmental effects, *Water pollution, Nitrogen, Phosphorus, Nitrates, Surface waters, Groundwater, Agronomy, Nitrogen fixation, Forests, Grasslands, Nutrients, Runoff, Percolation, Precipitation(Atmospheric), Fallout, Agriculture, Soil erosion, Nitrification, Fertility, Crop production, Legumes, *Reviews.

Fertilizers are one source of nitrogen and phosphorus that can degrade surface water quality and increase nitrate in groundwater, but sewage disposal is probably the most important degrader. Natural forests and grasslands can conserve these nutrients, thus loss in runoffs and percolates is less than the amount received from precipitation and dry fallout. The negative environmental impact of phosphorus and nitrogen began when forests and grasslands were destroyed for agriculture. Agriculture causes soil erosion, sedimentation, and transport of phosphorus and nitrogen to water. Loss of soil organic nitrogen and partial conversion to nitrate due to break up of grassland was a major factor in nitrate accumulation in ground waters. Commercial fertilizers are used due to soil fertility depletion resulting from erosion, natural degradation, crop removal, consumption of animal products, and improvement of crop varieties, pest control, and yields. However, fertilizer use has permitted production of crops on a minimum of land, thus reducing erosion hazards, irrigation requirements, energy, pesticides, etc. In the future, emphasis will be placed on the efficient use of fertilizers to make every acre produce to near its potential. The negative and positive uses of fertilizers are discussed in detail. (Buchanan-Davidson--Wisconsin)

USE OF STATE ESTIMATION TECHNIQUES IN WATER RESOURCE SYSTEM MODELING,
Washington Univ., Seattle. Dept. of Civil Engineering.
D. P. Lettenmaier, and S. J. Burges.
Water Resources Bulletin, Vol. 12, No. 1, p 83-99, February 1976. 7 fig, 1 tab, 14 ref.

Descriptors: *Water resources, *Model studies, *Water quality, Measurement, Design, Biochemical oxygen demand, Estimating, Equations, Algorithms, Systems analysis.
Identifiers: Kalman filters, Streeter-Phelps equation, Linear systems, Nonlinear, Divergence, Uncertainty analysis, *State estimation.

State estimation is a term loosely used to classify methods which combine a knowledge of the dynamics of evolution of a vector of state variables with a measurement of a function of some or all of the state variables to yield an estimate of the actual value of the state vector. Herein, a relatively straightforward illustration of the potential uses of State Estimation techniques in water resources modeling is given. Background theory for Linear and Extended Kalman Filters is presented. Application of the filter techniques to modeling BOD and oxygen deficit in a stream illustrates the importance of model conceptualization, model completeness, uncertainty in model dynamics, and incorporation of measurements and measurement errors. Potential applications of state estimation techniques to measurement system design, model building, assessment and calibration, and data extension are explored. (Bell-Cornell)

DAIRY LAGOON SYSTEM AND GROUNDWATER QUALITY,
Tennessee Univ., Knoxville. Dept. of Agricultural Engineering.
J. I. Sewell, J. A. Mullins, and H. O. Vaigneur.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 286-288.

Descriptors: *Lagoons, *Dairy industry, Tennessee, *Sampling, *Seepage, Coliforms, Streptococcus, Chloride, Nitrates, *Farm lagoons, *Farm wastes, Groundwater, Water quality.

In June, 1973, a manure lagoon and holding pond were constructed for a new 125-cow dairy at the West Tennessee Experiment Station. Research was initiated for determining lagoon seepage rates and the effects of lagoon operation on shallow groundwater quality. The lagoon was constructed in a terrace formation of fine sandy loam of low permeability to a depth of about 6 feet and sands with high permeability at depths from 6-20 feet. The normal water table depth varies from 8-20 feet and has a moderate gradient toward bottom land. Seven test wells located near the lagoon and holding pond and extending into the groundwater table were installed in June, 1973, Background levels of groundwater quality parameters were evaluated monthly. At startup, in April, 1974, and lagoon seepage was about one foot per week with full lagoon. A water balance is being maintaining by daily recording the operation of four flush tanks of known volumes. By August, 1974, lagoon seepage had decreased markedly. To date, water-table levels have shown little change due to system operation. Nitrate-nitrogen and chloride levels have shown little change. However, in the wells near the holding pond where the groundwater table is about 8 feet below the ground surface, fecal coliform and streptococci have tended to increase. Analysis of available data suggests that the lagoon system operation may have little effect on chemical levels but may increase bacterial concentrations on the downslope side. A system for recirculating lagoon effluent from the holding pond for flushing alleys is under construction. Quality parameters will be determined for the recirculated flush water. SEEPAGE BENEATH FEEDYARD RUNOFF CATCHMENTS,
Southwestern Great Plains Research Center Bushland, Tex.
R. N. Clark.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 289-290.

Descriptors: *Feed lots, *Agricultural runoff, *Groundwater, Texas, *Seepage, Nitrates, Nitrites, Chloride, Soil water, *Farm wastes, Playas, Waste water treatment.
Identifiers: Soil sealing treatments, Clay liner, Incorporated bentonite.

Recent laws require collection and storage of all feedyard runoff for control of surface water pollution; however, seepage from these catchments offers a potential for ground water pollution. Research studies were begun in 1969 at Bushland, Texas, to evaluate the seepage and sealing effects of impounded feedyard runoff. Results are presented from two types of runoff catchments, one naturally occurring and one man-made. Some feedlots in the area are located near shallow, saucer-type natural lakes called 'playas' while holding ponds have been constructed near others to impound the runoff. Soil chemical data have been obtained for samples taken to a depth of 12 feet beneath a playa which has caught feedyard runoff since 1967. These data have been compared to those from an adjacent non-feedyard playa. Nitrate, nitrite, chloride, and soil water were

similar in both playas in 1969 and 1974; changes in the feedyard playa were slight from 1969 to 1974. Three soil sealing treatments were compared in three newly constructed holding ponds. The treatments were a clay liner, incorporated bentonite, and check. After the initial impoundment of runoff, water loss rates were similar for all basins. Water loss rate approximated the evaporation rate 45 days from initial filling. These studies show that seepage rates beneath feedyard runoff catchments are low and seepage from runoff catchments presents little danger of ground water contamination. NUTRIENT LOSSES FROM MANURE UNDER SIMULATED WINTER CONDITIONS,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
T. S. Steenhuis, G. D. Bubenzer, and J. S. Converse.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 291-295.

Descriptors: *Winter, *Agricultural runoff, Temperature, Precipitation, Nitrogen, *Farm wastes, Nutrients, Waste disposal, Water pollution sources.
Identifiers: *Land spreading, *Nutrient losses.

Pollution caused by winter spreading of manure has received wide publicity. Research information necessary to quantify the effects of climatic factors on the rate of nutrient losses under winter conditions is needed. This research was undertaken to determine the effects of temperature and precipitation on the rate of nutrient transformation from winter spread manure and the surface transport mechanisms that place during the runoff cycle. To examine the pollution potential of winter spread manure with and without the effect of underlying soil layer, sample plots were covered with 20 cm of snow. Manure was applied as a urine-straw mixture or faeces at three depths within the snow layer. Plots were subjected to four cyclic temperature variations ranging from -8C to + 12C in an environmental chamber. Radiation conditions equivalent to a cloudy late January day were simulated. At the end of the snow melt period, plots were subjected to simulated rainfall. Eighty to ninety percent of the nitrogen was lost in the runoff from the snow with a water equivalent of 3 cm, when the urine-straw mixture was placed at the base or midpoint of the snow. Placement at the top resulted in only 10 to 15 percent of the originally applied N in the meltwater. Losses in runoff from simulated rain were inversely related to the amount lost in the snow melt. Five to twenty-five percent of the nitrogen of the faeces was lost in the snow melt process. The higher percentages were obtained for placement at the center and on top of the snow pack and subjected to a daily freezethaw cycle. Nitrogen losses from faeces were approximately 10 to 15 percent of the initial load when subjected to the simulated rain. (See also W76-07154) (East Central)

ANIMAL WASTE CONTRIBUTION TO NITRATE NITROGEN IN SOIL,
Pennsylvania State Univ., University Park.
L. F. Marriott, and H. D. Bartlett.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 296-298.

Descriptors: *Farm wastes, Application rates, Water pollution sources, Liquid wastes, *Dairy industry, Crop response, Soil water, *Groundwater, *Nitrogen, Sampling, Lysimeters, Nitrates.
Identifiers: *Soil injection, *Nitrate nitrogen.

Liquid dairy manure was injected on plots of orchardgrass at rates to supply 700-3500 pounds of nitrogen per acre per year for three successive years, and on orchardgrass, bluegrass and corn at rates to supply 200-600 pounds of nitrogen per acre. The concentration of nitrate nitrogen in soil water was determined on samples from suction lysimeters installed at depths of 1, 2, 3 and 4 feet. Crop yields were recorded and samples analyzed to measure nitrogen uptake. Soil samples to a depth of 4 feet were analyzed for nitrate and Kjeldahl nitrogen. The subsurface injection method provided complete control of malodors at the disposal site. Repeated applications of the high rates of manure resulted in increasing concentration of nitrate nitrogen in soil water at all depths of sampling. After applications were discontinued, there was a gradual reduction in nitrate nitrogen concentration with depth from 1 to 4 feet and with rate. The disappearance of the nitrate nitrogen from depths below the root zone indicates the potential for movement into ground water supplies. Manure rates supplying 300-600 pounds nitrogen per acre on bluegrass and orchardgrass increased the concentration of nitrate nitrogen in soil water at 3-4 feet to approximately two times the limit for potable water as set by the Public Health Service. The nitrate nitrogen level decreased 50% in the next growing season. These results are further evidence that the rate of application of animal waste must be adjusted to the crop requirements for N and to soil conditions to minimize the loss of nitrate nitrogen from the root zone. W76-07188

EFFECTIVENESS OF FOREST BUFFER STRIPS IN IMPROVING THE WATER QUALITY OF MANURE POLLUTED RUNOFF,
Maryland Univ., College Par., Dept. of Agronomy.
R. C. Doyle, D. C. Wolf, and D. F. Bezdicek.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 299-302.

Descriptors: *Agricultural runoff, *Coliforms, *Streptococcus, *Nutrients, *Water quality, *Water pollution sources, *Farm wastes, *Dairy industry.
Identifiers: *Land spreading, *Forest buffer zones.

Objectives were to determine the movement of fecal coliform, fecal streptococcus, total soluble P, K, Na, NO3-N, NH4-N, and organic-N in runoff water from manured land and establish the effectiveness of forest buffer zones in improving the water quality of manure polluted runoff. Dairy manure was applied at the rate of 90 metric tons per hectare, 69% moisture, on 0.19 hectare of a Chester gravelly silt loam soil (Typic Hapludult; fine loamy, mixed, mesic) having a 4% slope and planted in alfalfa. The experimental site was located in the Piedmont physiographic province of Maryland. Runoff was collected from a 35-40% slope forest by means of dust pan lysimeters at 0, 3.8, 7.6, 15.2, and 30.5 meter intervals from the manured area. Runoff samples were taken for four natural rainfall events after an initial August 1973 manure application. A second 90 metric tons per hectare of manure was spread in November, 1973 and runoff from three subsequent rains was collected. Runoff at 0 meters displayed high concentrations of P, K, Na, and total N, but fecal coliform and fecal streptococci densities were not significantly higher than background levels. Runoff from the manured area was most highly contaminated in the first rain after manure application, and the runoff water quality showed a tendency to improve with each additional rain. The degree of pollution in the runoff collected at 0 meters increased during the winter. Fecal pollutants in runoff water or soil collected at distances of 3.8 meters or greater could not be substantiated by either the biological or chemical parameters measured. Similarly, no effect on the stream adjacent to the plot area was observed. (See also W76-07154) (East Central)
W76-07189

EFFECT OF ANAEROBIC SWINE LAGOONS ON GROUNDWATER QUALITY IN HIGH WATER TABLE SOILS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Engineering.
E. R. Collins, Jr., T. G. Ciravolo, D. L. Hallock, D. C. Martens, and H. R. Thomas.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 303-305.

Descriptors: Hogs, Groundwater, Water table, Soils, Lagoons, *Anaerobic conditions, *Coastal plains, *Sampling, Chemical properties, Biological properties, Nutrients, Coliforms, *Farm wastes, *Farm lagoons.
Identifiers: *High water table soils.

The effect of anaerobic swine lagoons on the quality of groundwater in the Coastal Plains was investigated at the Virginia Swine Evaluation Station (VSES) and at the Tidewater Research and Continuing Education Center (TRACEC). The lagoons are located on soils with high water tables near Suffolk, Virginia. Chemical and biological tests were conducted on groundwater sampled at various depths and distances from the lagoons. Constituents determined were nitrates, ammonia, soluble orthophosphates, chlorides, chemical oxygen demand, manganese, copper, zinc, calcium, potassium, magnesium, sodium, and fecal coliform. Wells were water-jetted to 10-, 15-, and 20-foot depths at 10-, 50-, and 100-foot distances from the lagoons. Groundwater samples were taken monthly since August, 1973. The wells were purged one day before sampling. Samples for chemical analysis were stored under ice and dry ice in the field and transferred to a freezer in the laboratory. Before chemical analysis, the samples were filtered through a 0.45 micron filter. The biological determinations were initiated shortly after sampling. Data from the wells at TRACEC indicated influences other than the lagoon on groundwater quality. For this reason, these wells have been abandoned. A new lagoon has since been constructed at this location. Future work will entail monthly monitoring of the groundwater around the new lagoon at TRACEC, monitoring the groundwater around a lagoon on a private farm, and more intensive monitoring of groundwater at VSES with the establishment of more wells. SWINE WASTE LAGOONS AS POTENTIAL DISEASE RESERVOIRS,
Iowa State Univ., Ames. Dept. of Veterinary Pathology.
R. D. Glock, and K. J. Schwartz.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 334-335.

Descriptors: *Diseases, *Pathogenic bacteria, Lagoons, *Liquid wastes, *Recirculated water, *Salmonella, *Farm wastes, *Farm lagoons, *Hogs.
Identifiers: *Flushing gutter systems, Dysentery.

The design, construction, and use of swine waste lagoons and pits have been thoroughly described but the question of whether pathogenic organisms can persist in liquid wastes and act as biological hazards has not been adequately considered. Systems utilizing recirculation of lagoon effluent in flushing gutter systems would seem to be especially hazardous. Two groups of 3 pigs each were deprived of fresh water but were fed anaerobic lagoon effluent from gutter-flush tanks on a farm with a history of swine dysentery and salmonello-

sis. Two similar groups were held as controls with free access to clean water. Effluent used to flush gutters was capable of initiating S. st. paul infections and clinical swine dysentery. Salmonella st paul was also isolated from the lagoon effluent. T. hyodysenteriae-like organisms were observed in low numbers but isolation attempts failed. Further surveys of swine waste lagoons and pits resulted in isolation of Salmonella from 4 to 13 anaerobic lagoons and from 1 of 3 sub-floor pits. Serotypes isolated included S. molade, S. st. paul, S. typhimurium, S. manhattan, and S. agona. Pathogenicity of the various serotypes isolated is not known but it seemed significant that, in 2 instances, the same serotypes were isolated both from lagoon effluent and from rectal swabs of swine on the same premises. There was some indication that isolations of Salmonella were more frequently accomplished during the colder seasons. These findings do not suggest that anaerobic lagoons are undesirable but that more study is needed to determine specific disease transmission hazards. The potential of swine wastes as Salmonella reservoirs also needs further clarification. (See also W76-07154) (East Central)

ESTIMATING QUANTITY AND QUALITY OF RUNOFF FROM EASTERN BEEF BARNLOTS,
North Appalachian Experimental Watershed, Coshocton, Ohio.
W. M. Edwards, and J. L. McGuinness.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 408-411.

Descriptors: *Agricultural runoff, *Feed lots, *Cattle, Ohio, *Farm wastes, Water quality, Forecasting, Estimating.
Identifiers: *Prediction equation, Runoff quantity, Runoff quality.

Proposed EPA guidelines for feedlot effluent require that by 1983 all feedlot operations have the capacity to store runoff from 25-year, 24-hour rainfall. In view of these requirements, an analysis was made of runoff volume and quality from a typical unpaved beef barnlot in eastern Ohio. The measurements were made over a 4-year period on a 0.4 acre, 60 head barnlot watershed at the North Appalachian Experimental Watershed, Coshocton, Ohio. A prediction equation for daily runoff volume was developed by a multiple regression analysis of 181 runoff events. Rainfall amount and antecedent moisture content of the surface layer accounted for 75 percent of the storm runoff variability. Joint probabilities of various amounts of rainfall occurring with different antecedent soil moisture conditions were used to define maximum, minimum and mean daily runoff volumes at different times of the year. Inclusion of a rainfall intensity variable in the multiple regression did not improve the runoff volume prediction. The presence or absence of cattle in the lot at the time of the event also had no effect upon prediction of runoff volume. The seasonal distributions of N, P, K, and BOD concentrations in runoff were determined. Using long-term weather records, water quality data, and the runoff prediction equation, runoff volume and associated nutrient transport for 10- and 25-year frequency storms occurring at different times of the year were also estimated. The rainfall prediction was also used to extend runoff relations to paved lots. (See also W76-07154) (East Central)

DESIGN RUNOFF VOLUME FROM FEEDLOTS IN THE SOUTHWESTERN GREAT PLAINS,
Agricultural Research Service, Durant, Okla. Water Quality Management Lab.
V. L. Hauser.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 426-428.

Descriptors: *Design, *Agricultural runoff, *Feed lots, Texas, Economics, Great Plains, Farm wastes, Management, Equations.
Identifiers: Southwestern Great Plains, Runoff control, Runoff equations.

The design of feedlot pollution control systems required an estimate of the runoff volume to be controlled. Federal and State regulations presently rely on the Soil Conservation Service (SCS) equation for runoff estimation. They also rely on the Weather Bureau Technical Publication No. 40 (TP 40) for estimates of the design storm, which, in Texas, is 24-hour rainfall expected once in 25 years. The accuracy of these present design procedures is examined. A recently published equation for runoff derived from runoff measurements on a feedlot at Bushland, Texas (near Amarillo) was tested against the more widely used SCS equation. Runoff was computed by each equation for each day with rain in a 35-year rainfall record from Bushland and in an 82-year rainfall record for Amarillo. These computed runoff amounts were analyzed to derive return frequency of runoff amount for the new Bushland equation and for the SCS equation. The results show that the presently used design method may compute up to 3 times as much runoff as the new Bushland equation. In addition, significant differences were found between 24-hour, 25-year return frequency rainfall found in TP 40 and the actual record from the two stations analyzed. Over estimation of the design runoff amount from feedlots causes wasteful expenditure in both runoff reservoir construction and the purchase of a disposal system. This research indicates the need for revision of design methods and requirements of law. (See also W76-07154) (East Central)

QUANTITY AND QUALITY OF BEEF FEEDYARD RUNOFF IN THE GREAT PLAINS,
Southwestern Great Plains Research Center. Bushland, Tex.
R. N. Clark, C. B. Gilbertson, and H. R. Duke.
Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 429-431.

Descriptors: *Agricultural runoff, *Cattle, *Great Plains, Water quality, *Farm wastes, Water pollution sources.
Identifiers: Runoff quantity, Runoff quality.

The Great Plains Region has become the world's largest confined cattle feeding area during the last 10 years. The region increased fed cattle production from 6 million in 1963 to over 14 million in 1973. Also, during the last decade, water quality control regulations have been established requiring the impoundment of runoff and waste water from these feedyards. Runoff studies were begun about 1967 at several locations throughout the Great Plains in order to characterize feedyard runoff as to quantity and quality. The objective is to combine these data and present them in a uniform format. Rainfall-runoff relationships are presented from seven feedyards from eastern Nebraska and eastern Colorado to South Texas. In all cases, the rainfall-runoff relationship was linear; however, the slopes varied from 0.36 to 0.86. Runoff did not begin until at least 1 cm (0.4 inch) of rainfall had occurred. The quality of runoff was quite variable at each location depending on rainfall intensity and duration, time since last runoff, and stocking rate. However, noticeable differences were found between the various research locations. The concentration of salts was less in eastern Nebraska and increased inversely with total rainfall to highest concentration in West Texas. (See also W76-07154) (East Central)

DIFFUSION AND MIGRATION OF POLLUTED WATER ALONG THE BELGIAN BEACHES. NEW EXPERIMENT INVOLVING DUMPING OF 100 KG RHODAMINE B: PRELIMINARY CONCLUSIONS, (IN FRENCH),
Institut Royal des Sciences Naturelles de Belgique, Ostend. Laboratoire de Bacteriologie.
Z. Dartevelle, J. Pinon, R. Rousseau, and W. Deschacht.
Bull Inst R Sci Nat Belg Biol 50(8), p 1-18. 1974.

Descriptors: *Path of pollutants, Europe, Migration, *Beaches, *Water pollution sources, *Diffusion, *Rhodamine, Waste disposal, *Dye dispersion.
Identifiers: Flourometry, *Belgium.

A solution of 100 kg rhodamine B was introduced into a sewer which discharges into the sea. Discharge dispersion was observed and located by means of 4 optical theodolites and by aerial photographs. Water samples were collected in the colored plume and on its boundaries during a whole tidal cycle, and analyzed by spectrofluorimetry. The factors affecting water movements are complex. The drift apparently is mainly due to the wind. The predominating winds contribute to maintaining the waste water closely to the water line over a distance of several miles.--Copyright 1975, Biological Abstracts, Inc.

STATISTICAL DESIGN BASIS FOR SUBMERGED DIFFUSER,
Quirk, Lawler and Matusky, New York.
T. E. Pease, and M. J. Skelly.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. PO1, Proceedings paper No. 11408, p 11-22, July 1975. 10 fig, 2 tab, 12 ref.

Descriptors: *Lakes, *Oceans, *Thermal pollution, Hydrography, *Statistical methods, *Regulation, Powerplants, Waste disposal, Design, Environment, Pollution abatement, Equations, Evaluation, Methodology, *Diffusion.
Identifiers: *Diffusers, Environmental impact statements, Submerged orifices.

A comparison is made among discharge criteria for various atmospheric and aquatic emissions. The dependence of effluent plume size on water levels, ambient temperatures, and drift currents was empirically determined from model simulation. Predictions of the effluent plume size frequency distribution were made: (1) assuming the parameters are independent random variables; and (2) using a time series of lake levels, temperatures, and currents. The second method predicted less frequent occurrence of large plumes. It is concluded that: (1) statistical description of predicted thermal plumes represents a more realistic evaluation of environmental impact than prediction for a 'critical' condition; (2) readily available site data can be utilized to make statistical predictions of the effluent plume size for proposed outfalls; and (3) the effectiveness of design changes can be statistically evaluated and interpreted as frequencies with which given thermal criteria may be contravened. PH PROFILES IN A RIVER SYSTEM WITH MULTIPLE ACID LOADS,
Massachusetts Inst. of Tech., Boston. Dept. of Civil Engineering.
J. G. Yeasted, and R. Shane.
Journal Water Pollution Control Federation, Vol. 48, No. 1, p 91-106,January 1976. 4 fig, 2 tab, 17 ref, 1 append. OWRT C-2183(No.3381)(3)

Descriptors: *Model studies, *Water pollution sources, *Path of pollutants, *Coal mine wastes, *Acid mine water, Acid streams, Mine acids, Mine drainage, Pyrite, Coal mines, Mine wastes, Industrial wastes, Water quality, Water pollution, Computer models, Pennsylvania.
Identifiers: *Kiskiminetas River basin(Pa), Loyalhenna Creek(Pa), Program BASIN.

A computer model capable of simulating the effects of multiple acid loads on the water quality of a free flowing, branched river system is described. With the State of Illinois water quality model, Program BASIN, as its basis, the model routes the chemical quantities, alkalinity and CO2 acidity through a branched river system. The effect of carbon dioxide transfer at the air-water interface is included in the routing procedures. Predicted values of alkalinity and CO2 acidity are used to compute pH at all node points. Field data needed to verify and apply the model are described together with sample application to the Kiskiminetas River Basin. (Bender-ISWS)

Descriptors: *Iron, Lakes, Africa, *Seasonal, Flood plains, Survey, Distribution patterns.
Identifiers: *Lake Chad.

Reactive Fe is Fe which is present in solution after 10 min of boiling of a raw water sample with 4% HCl. The reactive iron brought to lake Chad by the Chari and Lagone rivers was measured weekly. Although the water volume reaching the lake has decreased from 1970-71 to 1972-73, the iron load brought to the lake has increased: 98, 110 and 147 thousand metric ions for 1970-71, 1971-72 and 1972-73, respectively. This shows the importance of the 'flood plains' which were not flooded the last season, due to an unusually low flood. A survey of the seasonal pattern of dissolved silica during the last year explains, in part, the variations in reactive Fe according to the ratio between waters which have been either running on or seeping through the soils in the catchment area.--Copyright 1975, Biological Abstracts, Inc.

Hebrew Univ., Rehovoth (Israel). Dept. of Soil and Water Science; and Hebrew Univ., Rehovoth (Israel). Faculty of Agriculture.
N. Lahav, and Y. Kahanovitch.
Water Air Soil Pollut. 3(3), p 253-259, 1974.

Descriptors: *Pesticide residues, Soils, Coasts, Groundwater, Wells, Aldrin, Aquifers, DDD, DDT, Dieldrin, Heptachlor, Pesticides.
Identifiers: Bhc, Epoxide, Israel, Lindane.

Water samples from 12 wells on the coastal aquifer of Israel were analyzed for gamma-BHC (lindane), alpha-BHC, aldrin, opl DDD, ppl DDT, dieldrin, heptachlor and heptachlor-expoxide. Lindane was found in 5 wells with concentrations ranging from traces to 15 ppt. Alpha-BHC was detected in 1 well (4 ppt). None of the other pesticides could be detected. The wells where lindane was detected were between 13 m-26 m deep and the soil above the water table was sandy. Lindane occurrence is attributed to heavy localized applications and downward movement of water in considerable quantities. Analysis of the potential mobility of lindane indicates that it can be in sandy soils.--Copyright 1975, Biological Abstracts, Inc.

M. J. Frissel, P. Poelstra, and N. Van Der Klugt.
Geol Mijnbouw. 53(4): 163-170. Illus. 1974.

Descriptors: Mercury, Heavy metals, Soils, Sands, Path of pollutants, Clays, Organic matter adsorption, Model studies, Potable water, Pesticides.
Identifiers: Rhine River, *Netherlands.

Soil constituents such as clay minerals, sands and organic materials are described. The properties which control the adsorption of traces of heavy metals and pesticides were studied. The behavior of Hg in Dutch and other western European soils is discussed. Because some of the drinking water companies in western Holland get their water from the River Rhine by filtration through dunes, the migration of Hg in soils got serious attention. Most Hg compounds (Hg, HgC12, HgC1CH3) do not migrate in soil, but the volatile Hg (Ch3)2 migrates quickly. The contamination of soils is partly caused by agricultural measures and partly by flooding with water from the Rhine. The main Hg source comes from the wash out of the atmosphere. The contamination of soils in areas with a high population density and much industry is considerably higher than in other areas. A simulation model was developed to descsribe the Hg fall out drain rate.--Copyright 1975, Biological Abstracts, Inc.

North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No. 112, March 1976. 202 p, 40 fig, 35 tab, 104 ref. OWRT A-077-NC (4) 14-31-0001-5033.

Descriptors: *Aquatic plants, *Rooted aquatic plants, Aquatic population, Plant morphology, Aquatic weeds, Submerged plants, Plant growth, Nutrients, Nitrogen, Phosphorus, *North Carolina, Distribution, Biomass, Algae, *Rhodophyta.
Identifiers: *Pamlico River Estuary(NC), *Macrophytes, *Vallisneria Americana.

The ecology of the submersed aquatic macrophytes (including filamentous algae) of the Pamlico River NC estuary was studied from the summer of 1973 through the summer of 1975. Rooted macrophytes were not found in the lower half of the estuary proper. The distribution and biomass of the plants were an expression of physical factors associated with the morphology of a shallow turbid coastal plain estuary in a temperate region along with the inherent variability of the species present. Nutrients, at least N and P, did not appear to limit distribution. Phosphate is extremely high in this estuary, partly in association with a phosphate mine on the south shore. Biomass was estimated with aerial photography and ground truth studies. Vallisneria americana was the dominant rooted macrophyte, comprising 85% or more of the rooted biomass. This species turns over in biomass several times a year as leaves continually die and are lost. The red alga, Compsopogon coeruleus, accounted for most of the total biomass in 1973 and 1974 but was sparse in 1975. In situ mesh bag experiments indicated rapid decay of macrophytes with the half-life of organic dry weight being less than two weeks in the summer. (Stewart-North Carolina State)

STUDY OF SR90/SR RATIO IN A LATVIAN SEASIDE LAKE,
Akademiya Nauk Latviiskoi SSE, Riga. Inst. of Biology.
M. P. Leinerte, D. R. Vadzis, Z. K. Kalninya, and Y. Sloka.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 43-48, 3 fig, 1 tab, 10 ref.

Descriptors: *Radioecology, *Strontium, *Strontium radioisotopes, Water pollution effects, Plankton, Benthos, Fish, Aquatic life, Bottom sediments, Migration, Eutrophication.
Identifiers: *Accumulation coefficients.

Comparisons were made between Sr90 and stable Sr in water, plankton, macrozoobenthos, macrophytes, fish and bottom soils of an ultraeutrophic lake. A direct dependence existed between the amount of stable Sr and Sr90; the greater the amount of Sr90 in the object, the greater the amount of stable Sr it contains and vice versa. The discrepancy between the content of radioactive and stable Sr in hydrobionts increases during the vegetative period. (See also W76-06861) (Chilton-ORNL)
W76-06869

SR90/SR RATIO IN PLANKTON OF LATVIAN LAKES OF VARIOUS TYPES,
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Biology.
S. K. Kalninya.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuelides in Freshwater and Seawater Biocenoses, 1973. p 49-52, 2 fig, 1 tab, 2 ref.

Descriptors: *Radioecology, *Strontium, *Strontium radioisotopes, Water pollution effects, *Plankton, Trophic levels, Lakes.

Comparison of the specific activity of Sr in plankton and in water showed that activity of Sr was higher in water in all cases. The greatest difference was observed for the eutrophic and mesotrophic lakes (3.6 times) and the smallest difference for the dystrophic (2.1 times) and ultraeutrophic (2.6 times) lakes. With respect to the values of specific activity in plankton and in water, lakes of various trophic levels were in the following decreasing sequence: dystrophic, eutrophic, mesotrophic, and ultraeutrophic. W76-06870

RATIO BETWEEN CS137 AND K ACCUMULATION COEFFICIENTS IN FRESHWATER ORGANISMS,
Akademiya Nauk SSSR, Leningrad. Institut Evolyutsionnoi Fiziologii i Biokhimii
A. A. Solyus.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 62-65, 2 tab, 7 ref.

Descriptors: *Radioecology, *Cesium, *Potassium, *Aquatic life, Food chains, Radioisotopes, Freshwater, Lakes, Absorption.
Identifiers: *Accumulation coefficients.

From the determination of the ratio of the accumulation coefficient of Cs137 to the accumulation coefficient of potassium in aquatic life from nine lakes, it was established that this observed ratio did not depend on the concentration of potassium in the water of freshwater lakes. The primary factor for determining the observed ratio value is the composition of the food. This indicates the possibility of using this characteristic not only for studying the processes of accumulation of radiocesium, but also as an indicator of food interrelations among hydrobionts. (See also W76-06861) (Chilton-ORNL)

ENVIRONMENTAL NA22 IN FRESHWATER ECOSYSTEM STUDIES,
Akademiya Nauk SSSR, Leningrad. Institut Evolyutsionnoi Fiziologii i Biokhimii.
D. G. Fleishman, and Y. N. Kanevskii.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 66-69, 1 tab, 1 fig, 6 ref.

Descriptors: *Radioecology, *Sodium, *Ecosystems, Freshwater, Sea water, Habitats, Lampreys, Smelts, Salmon, Lakes, Radioisotopes, Rivers.
Identifiers: *Specific activity, Half-life.

The content of Na22 and specific activity of sodium in some lakes and rivers of the USSR were studied in 1968-1971. Substantial differences in the values of specific activity of sodium between marine and freshwater systems were found which made it possible to study the exchange of sodium between migratory fish and lampreys and the environment. The exchange of sodium in Pacific salmon, smelt and lampreys progresses via nonalimentary routes and the value of specific activity of sodium in them becomes equal to the value in their habitat after two or three months in freshwater. The values of sodium biological half-life estimated for these animals was 15-30 days. (See also W76-06861) (Chilton-ORNL)
W76-06874

ON ACCUMULATION OF SR90 AND CS137 BY SOME FISH SPECIES IN FRESHWATER RESERVOIRS,
Kazan Inst. of Biology (USSR).
B. I. Bragin, and S. A. Matmuratov.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 74-77, 1 tab, 4 ref.

Descriptors: *Radioecology, *Strontium, *Strontium radiosisotopes, *Cesium, Fish, Freshwater, Reservoirs, Calcium, Potassium, Fish diets.

Seven species of fish from reservoirs with mineralization ranging from 1058-5450 mg/l, potassium concentrations ranging from 15-110 mg/l, and calcium concentrations from 20-40 mg/l were studied. Sr90 and Cs137 accumulation in the fish was determined. The data indicated that K concentrations in muscular tissues and Ca in bone tissues of the fish are practically constant and do not depend on their content in the water while the content of Cs137 and Sr90 in these tissues of all fish depends on the concentration of K and Ca in the water. The data also showed the connection of the differences in the accumulation of radionuclides with the nature of the diet of fishes. (See also W76-06861) (Chilton-ORNL)
W76-06876

K, RB, AND CS EXCHANGE DYNAMICS IN FISH AND LAMPREY MIGRATING FROM SEA TO FRESH WATER (BEFORE SPAWNING),
Akademiya Nauk SSSR, Leningrad. Institut Evolyutsionnoi Fiziologii i Biokhimii.
Y. P. Kaneviskii.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 78-81, 1 fig, 1 tab, 9 ref.

Descriptors: *Radioecology, *Fish migration, *Potassium, *Rubidium, *Cesium, Freshwater, Sea water, Fish, *Lampreys, Smelts.

Migratory smelt and lampreys do not eat during their stay in fresh water in the prespawning period. For this reason they were chosen to study the change in K, Rb, and Cs concentrations in order to understand the role of nonalimentary routes of entry of these elements into the organism. The data indicated no increase in the concentrations and that these elements do not enter the organisms or migrating animals when they are in freshwater. (See also W76-06861) (Chilton-ORNL)
W76-06877

THE ROLE OF WATER AND FOOD IN THE UPTAKE OF CS137 BY FISH ORGANISMS,
Ministerstvo Zdravookhraneniya S. S. S. R. Moscow. Institut Biofiziki.
A. G. Pakulo.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 82-84, 1 tab, 6 ref.

Descriptors: *Radioecology, *Cesium, Food, Fish, Laboratory tests, *Absorption, Fish food organisms.

Comparisons were made between fish receiving food contaminated with Cs137, fish inhabiting water contaminated with Cs137 but with no food contamination, and fish inhabiting contaminated water and receiving contaminated food. The maximum uptake of Cs137 by fish organisms occurred with water and food. With equal concentrations of nuclide in water and food, the bulk of Cs137 entered the fish from the water. (See also W76-06861) (Chilton-ORNL)
W76-06878

ON THE ROLE OF THE ALIMENTARY ROUTE IN CS137 ACCUMULATION BY GUDGEON,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kaliningrad (USSR).
A. A. Stepin.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 89-91, 1 tab, 10 ref.

Descriptors: *Radioecology, *Cesium, *Absorption, Fish, Food, Laboratory tests.
Identifiers: *Gudgeons.

Comparisons were made of the Cs137 uptake of gudgeons living in uncontaminated water but being fed contaminated food, gudgeons living in contaminated water and being fed uncontaminated food, and gudgeons living in contaminated water and being fed contaminated food. The data showed that absorption through the skin and the gill apparatus should be considered as the main route of Cs137 entrance into the gudgeon organism. (See also W76-06861) (Chilton-ORNL)
W76-06880

UPTAKE OF SR90 BY ORGANISMS OF GAMMARUS SP AND CHIRONOMUS F. L. PLUMOSUS L.,
Akademiya Nauk Litovskoi, SSR, Vilnius. Inst. of Botany.
D. P. Marchyulenene, N. K. Shtryupkuvene, and G. G. Polikarpov.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, (1973). p, 92-95, 3 fig, 1 tab, 3 ref.

Descriptors: *Radioecology, *Strontium, *Absorption, Aquatic animals, *Crustaceans, *Diptera, Insects, Food.

The study established that the crustacean, Gammarus Sp, accumulated Sr90 in greater quantities than did the insect, chironomid larvae. The data also showed that the Sr90 enters the organisms in greater amounts from water than from radioactive food. (See also W76-06861) (Chilton-ORNL)
W76-06881

DIFFERENCES IN THE SPECIFIC ACTIVITY OF CS137 IN THE COMPONENTS OF A FRESHWATER ECOSYSTEM,
Akademiya Nauk SSSR, Moscow. Inst. of Evolutionary Physiology.
D. G. Fleishman, Y. P. Kanevskii, and A. A. Solyus.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, (1973). p 96-100, 2 fig, 1 tab, 8 ref.

Descriptors: *Radioecology, *Cesium, *Food chains, *Radioisotopes, Freshwater, Fish, Ecosystems, Aquatic organisms.

Differences in the accumulation of Cs137 and Cs by freshwater organisms was explained on the concept that Cs does not enter the organisms directly from water, but from food. Therefore, the specific activity of Cs in fish must be the same as in their food, but may not coincide with specific activity of the nuclide in lake water if the ecosystem has a Cs source with a Cs137/Cs value different from water which is accessible for assimilation by the aquatic organisms. Significant differences in the accumulation of Cs137 and Cs were found only in the aquatic organisms connected with the benthos food chain. (See also W76-06861) (Chilton-ORNL)
W76-06882

MIGRATION OF SR90 FROM FISH ORGANISMS INTO OFFSPRINGS,
Akademiya Nauk SSSR, Sverdlovsk. Inst. of Plant and Animal Ecology.
V. G. Kulikova, and N. V. Kulikov.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, (1973). p 101-104, 2 fig, 1 tab, 3 ref.

Descriptors: *Radioecology, *Strontium, *Fish eggs, Fish, Embryonic growth stage, Migration.

Female guppies and paradise fish were used to study the dynamics of Sr90 accumulation in various organs and tissues of fish with consideration for the accumulation in the forming eggs and embryos. The highest accumulation coefficients of the radionuclide were found in skeletal formations and the lowest were found in soft tissues. Maximum accumulation coefficients in the eggs of the paradise fish were expressed in decimal fractions, while they were higher by almost two orders in the eggs of the guppies. The removal of Sr90 from fish organisms was determined by the degree of the development of the eggs, the concentration of the radionuclide in the eggs, and by the mass of sexual products in the organism. (See also W76-06861) (Chilton-ORNL)
W76-06883

THE ROLE OF FRESHWATER FISH AS A POSSIBLE SUPPLIER OF P32 UNDER THE CONDITIONS OF POLLUTION OF NATURAL WATER RESERVOIRS BY THIS RADIONUCLIDE,
Ministerstvo Zdravookhraneniya S.S.S.R., Moscow. Institut Biofiziki.
For primary bibliographic entry see Field 5B.
W76-06884

BIOLOGICAL EFFECTS OF RU106 AND J131 ON WATER ORGANISMS,
Nauchno-Issledovatelskii Institut Radiatsionnoi Gigieny, Leningrad (USSR).
V. N. Gus'kova, N. I. Mashneva, L. F. Rodionova, V. M. Kupriyanova, and A. A. Zasedatelev.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, (1973). p 110-114, 3 tab, 8 ref.

Descriptors: *Radioecology, *Radioisotopes, *Radioactivity effects, *Environmental effects, Aquatic life, Plankton, Fish, Larvae, Iodine, Rubidium, *Water pollution effects.
Identifiers: *Accumulation coefficients.

The purpose of this work was to carry out studies on the effects of J131 and Ru + Rh106 on the viability of a water reservoir as a whole and some biological components under the conditions of a single contamination within a range of concentrations of from 10 to the minus 8th power to 0.01 curie/liter. Some biological effects by these radionuclides were found in a concentration of 0.001 to 0.00001 curie/liter. Lower concentrations were found to be harmless. It was established that the intensity and value of accumulation depended on the organization stage of the hydrobiont. The highest accumulation coefficients were observed in the simplest organisms and the lowest coefficients were found for eggs, larvae and adult fish. (See also W76-06861) (Chilton-ORNL)
W76-06885

ACCUMULATION OF CS137 BY INDUSTRIAL FISH SPECIES IN THE CASPLAN SEA,
Kaspiiskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Astrakhan (USSR).
N. A. Bakunov, A. P. Panarin, and L. V. Fedotova.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, (1973). p 136-139, 2 fig, 5 ref.

Descriptors: *Radioecology, *Fish, Strontium, Cesium, Seawater, Freshwater, *Absorption.
Identifiers: *Accumulation coefficients, Volga Delta, *Caspian Sea.

Concentrations of Cs137 are expressed by values of one order from 53 to 87 picocurie/kg which were the representative concentrations found in the anchovylike sprat. Clearly expressed differences were found in the accumulation of Cs137 by marine and freshwater fishes. Concentrations of Cs137 in freshwater fishes of the Volga Delta in 1969 were somewhat lower than in sea fishes of the Caspian Sea. (See also W76-06861) (Chilton-ORNL)

W76-06891

MECHANISMS OF ACCUMULATION OF RADIOACTIVE AND STABLE SR BY NORTHERN MARINE ALGAE UNDER NATURAL AND EXPERIMENTAL CONDITIONS,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kaliingrad (USSR).
V. S. Zlobin.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p140-143, 1 tab, 1 fig, 9 ref.

Descriptors: *Radioecology, *Strontium, *Algae, Aquatic algae, Sorption, Salinity, Absorption, Oceans.
Identifiers: *Accumulation coefficients, *Barents Sea.

Studies on algae growing in the coastal regions of the Barents Sea showed that the content of Sr90 in macrophytes varied from 0.53 to 14.00 times 10 to the minus 11th power curie/kg of wet weight, and accumulation coefficients varied from 14 to 4830, constituting on the average 386 + 275 (n=12). The accumulation coefficient of stable Sr in Fucus vesiculosus and Ascophyllum nodosum changed depending on the salinity. Strontium sorption on the surface of algae is the basis of its accumulation in the tissues. (See also W76-06861) (Chilton-ORNL)
W76-06892

COMPARATIVE EVALUATION OF THE ACCUMULATION DYNAMICS OF SOME CORROSION AND FISSION GROUP RADIONUCLIDES AND ALPHA EMITTERS BY NORTHERN MARINE ALGAE,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kaliningrad (USSR).
V. S. Zlobin.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 144-147, 2 fig, 13 ref.

Descriptors: *Radioecology, *Radioisotopes, *Marine algae, Cesium, Rubidium, Rhodium. Uranium, Polonium, Plutonium, Cobalt, Iron, Manganese, *Absorption.
Identifiers: *Accumulation coefficients.

Accumulation coefficients of Co., Fe, Mn, Cs137, Y91, Ru106 + Rh106, U, Po210, and Pu239 were studied in brown algae. It was found that the application of inhibitors and stimulators of cell respiration showed a dependence of the accumultion of colloidal particles and Pu239 on the point of damage in the system of cytochromes and the degree of interest on the part of the energy system of the plant cell. The variation limits of the accumulation of Pu239 were from 136 to 38%. (See also W76-06861) (Chilton-ORNL)
W76-06893

RADIOACTIVE CONTAMINATION OF COMMERCIAL HYDROBIONTS OF THE WESTERN BASIN,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kainingrad (USSR).
N. P. Prokhorycheva.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater ad Seawater Biocenoses, 1973. p 148-152, 2 tab, 4 ref.

Descriptors: *Radioecology, *Strontium, *Cesium, Radioisotopes, Fish, Oceans, Absorption.
Identifiers: Baltic Sea, North Sea.

Data showed an increase in the concentration of Sr90 in the bone tissues of herring, cod and haddock caught in the Baltic and North seas in 1968-1971. Cartilaginous fishes showed no increase of Sr90 concentrations. The concentration of Cs137 in muscle tissues of cod and flounder caught in the Baltic Sea between 1969 and 1971 decreased noticeably. On this basis, it was established that there was no clear dependence of the accumulation intensity on the nature of feeding. (See also W76-06861) (Chilton-ORNL)
W76-06894

RADIOECOLOGICAL CONCENTRATION PROCESSES IN THE WATER-FISH LINE,
Scientific Research Inst. of Radiation Hygiene, Leningrad (USSR).
L. A. Teplykh.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Bioncenoses, 1973. p 153-156, 4 tab, 2 ref.

Descriptors: *Radioecology, *Radioisotopes, *Fish, Polonium, Absorption.

The study established that Po210 is the basic dose-forming isotope in fishes. Among the studied organs and tissues of fishes, the highest concentrations of Po210 were found in the liver, spawn and milt. Concentratins of K, Pb210, Po210, Ra226, and Th228 in sea water and tissues of commercial fishes were determined in the study. (See also W76-06861) (Chilton-ORNL)
W76-06895

ACCUMULATION OF SR90, CA, AND SR BY FISH IN SEAS AND OCEANS,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
V. P. Shvedov, G. G. Polikarpov, and I. A. Skolova.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 157-159, 1 tab.

Descriptors: *Radioecology, *Strontium, Calcium, *Fish, *Oceans, *Absorption.
Identifiers: *Accumulation coefficients.

The values of Sr90 accumulation coefficients and those of stable Ca and Sr differ, which indicates the peculiarities of their selective absorption. The accumulation coefficients of Sr90 depend chiefly on the fish species and the salinity, temperature and presence of nutrients in the water. (See also W76-06861) (Chilton-ORNL)
W76-06896

ACCUMULATION OF RADIOACTIVE AND STABLE ZINC BY BLACK SEA ALGAE CYSTOSEIRA BARBATA AND ULVA RIGIDA,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
L. I. Rozhanskaya.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 160-162, 1 fig, 5 ref.

Descriptors: *Radioecology, *Zinc, *Algae, Absorption.
Identifiers: *Accumulation coefficients, *Cystoseira barbata, *Ulva rigida, *Black Sea.

The data showed that the accumulation coefficients of Zn65 for the two species of algae were 2-3 times smaller than the corresponding accumulation coefficients of stable zinc. According to the obtained data, calculations of the specific activity of zinc show that it is less than one in all instances. This can testify to weak exchange of zinc in macrophyte structures. (See also W76-06861) (Chilton-ORNL)
W76-06897

ON TH234 ACCUMULATION BY MARINE ORGANISMS,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
A. Y. Zesenko, and A. B. Nazarov.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 163-166, 1 fig, 13 ref.

Descriptors: *Radioecology, *Thorium, Algae, *Phytoplankton, *Marine algae, *Absorption.
Identifiers: *Accumulation coefficients, Ulva rigida, Entermorpha linza, Cystoseira barbata.

Maximum accumulation coefficients of Th234 for the algae were established as reaching 1200, 700, and 60 for Ulva rigida, Enteromorpha linza, and Cystoseira barbata, respectively. The maximum accumulation coefficient of Th234 was reached by phytoplankton at 20,000. It was determined that marine organisms play a considerable role in shifting the radioactive equilibrium of U/Th in sea water. (See also W76-06861) (Chilton-ORNL)
W76-06898

MATHEMATICAL MODEL OF SR90 EXCHANGE BETWEEN CYSTOSEIRA AND MARINE WATER,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
V. N. Egorov, and L. G. Kulebakina.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 167-169, 2 fig, 3 ref.

Descriptors: *Radioecology, *Mathematical models, *Strontium, Algae, *Marine algae, Metabolism.
Identifiers: *Cystoseira.

A mathematical model of nuclidic exchange was constructed using the concept of metabolism in the system Sr90 in marine water--Cystoseira as a chamber structure. The model described its dynamics and made it possible to interpret the concentration phases biophysically. (See also W76-06861) (Chilton-ORNL)
W76-06899

RADIOECOLOGO-BIOCHEMICAL APPROACH TO THE STUDY OF THE COBALAMINE CYCLE IN THE OCEAN,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
A. G. Benzhitskii.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 170-173, 2 tab, 13 ref.

Descriptors: *Radioecology, Cobalt, *Cobalt radioisotopes, *Marine microorganisms, Oceans, Absorption, Marine animals.
Identifiers: *Cobalamines.

Marine organisms extract cobalt, its artificial radionuclides and cobalamines from sea water. The transition of mineral cobalt into the form of vitamin B12 increases its migration abilities. Inclusion of atoms of cobalt radionuclides into a molecule of vitamin B12 may have greater consequences for the organism than an external irradiation with gamma-quanta equal with respect to the forming doses. (See also W76-06861) (Chilton-ORNL)
W76-06900

THE ROLE OF SOME POLYSACCHARIDES OF BROWN ALGAE IN THE EXTRACTION OF SR90 FROM SEA WATER,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
D. D. Ryndina.

In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. 174-175, 3 ref.

Descriptors: *Radioecology, *Strontium, Algae, Sorption, Sea water, *Phaeophyta, *Marine algae.
Identifiers: *Polysaccharides, Cystoseira.

Experiments were done on live and dead specimens of algae containing arious polysaccharides (alginic acids, fucoidan, and 'aluglose'), as well as on individual carbohydrates isolated from the organisms. It was found that Sr90 was extracted most readily from sea water by hydrobionts which contained all polysaccharides. Accumulation coefficients of Sr90 decreased during decomposition of Cystoseira and the formation of detritus due to the changes in the sorption properties of alginic acids with the change of pH of intracellular solutions. (See also W76-06861) (Chilton-ORNL).
W76-06901

INVESTIGATIONS ON THE ADSORPTION OF CO60 AND CS137 ON SURFACES OF BROWN ALGAE AND GLASS UNDER EXPERIMENTAL CONDITIONS,
Atlantic Scientific Research Inst. of Fisheries and Oceanography, Kaliningrad (USSR).
N. I. Buyanov.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 176-179, 3 fig, 7 ref.

Descriptors: *Radioecology, *Adsorption, Surfaces, Cesium, Cobalt, Algae, *Phaeophyta.

Identical nuclide concentrations (0.000001 curie/liter) of Cs137 andCo60 were used in the experiments. Glass plates were placed into the solutions simultaneously with the algae. Accumulation of Co60 and Cs137 by the Algae had a common regularity with the increase in the radioactivity of the glass plates. These experiments confirms the assumption that a considerable role in the accumulation of radionuclides by algae is played by the processes of their adsorption on the surface. (See also W76-06861) (Chilton-ORNL)
W76-06902

INFLUENCE OF SALINITY AND CONCENTRATION OF SR AND CA IN WATER ON THE SR90 ACCUMULATION BY CYSTOSEIRA,
Institute of Biology of the Southern Seas, Sevastopol (USSR).
L. G. Kulebakina, and D. S. Parchevakaya.
In: Radioecology of Water Organisms, Vol. 2. Distribution and Migration of Radionuclides in Freshwater and Seawater Biocenoses, 1973. p 180-182, 1 tab, 11 ref.

Descriptors: *Radioecology, *Salinity, Algae, Strontium, Calcium, Sea water, *Marine algae, Absorption.
Identifiers: *Accumulation coefficients, *Cystoseira.

Salinity was found to be the strongest factor affecting the accumulation coefficient of Sr90. On the basis of obtained data, it was concluded that when salinity changes, the accumulation coefficients do not change as much because of changes in the concentration of isotopic or nonisotopic carriers such as strontium, calcium as under the effect of the overall salinity of a medium affecting the functional state of the organism. Descriptors: *Bibliographies, *Radioecology, *Radioactivity effects, *Radioisotopes, Freshwater, Terrestrial habitats, Marine biology, Estuarine environment, Ecology, Environmental effects, Watr pollution effects.

This is a supplement of over 2,000 references to an original bibliography published in 1971 on literature related to a radiation ecology. In general a reference is included in only one subject category. No abstracts are included. In compiling the list an attempt was made to provide complete information concerning each reference without excessive library search. When known, each reference is followed with its Nuclear Science Abstract designation. Subjects included are: status and needs of radiation ecology; environmental radioactivity; radionuclide concentration; ionizing radiation effects, techniques and measurement; peaceful uses of atomic energy; waste disposal; nuclear testing and consequences; glossaries, standards and licensing procedures. (See also W75-09891, W73-07962, W72-04452, and W71-09232), (Chilton-ORNL)

MODEL ECOSYSTEM STUDIES OF LEAD AND CADMIUM AND OF URBAN SEWAGE SLUDGE CONTAINING THESE ELEMENTS,
Illinois Univ. at Urbana-Champaign. Dept. of Entomolygy.
P-Y. Lu, R. L. Metcalf, R. Furman, R. Vogel, and J. Hassett.
Journal of Environmental Quality, Vol. 4, No. 4, p 505-509, October/December, 1975. 2 fig, 5 tab, 20 ref.

Descriptors: *Model studies, *Laboratory investigations, *Lead, *Cadmium, *Sewage sludge, *Heavy metals, Metals, Soils, Agriculture, Crops, Ecosystems, Sludge disposal, Water pollution effects.
Identifiers: *Land application.

A laboratory model ecosystem was constructed to investigate the environmental fate of lead from lead chloride and cadmium from cadmium chloride by direct application of two types of soils or by using sewage sludge as the source of heavy metals. The model used a terrestrial/aquatic interface with silica sand, Bloomfield soil (sandy loam) and Drummer soil (silty clay loam) as substrates. Applications of lead, cadmium, and sewage sludge were made directly to the substrates. Lead and cadmium were mobilized and incorporated into the food chain organisms in proportion to the sorption capacity of the substrate and were highest in silica sand and lowest in the Drummer soil. With sewage sludge application, there was a significant mobilization and transfer of cadmium, copper, lead and zinc into the food chains of alga, daphnia, mosquito larva, snail, and fish. Cadmium in particular had a negative effect on various organisms in the model ecosystem. It was suggested that if urban sewage sludge is to be applied to croplands, steps to prevent the sludge from trace metals contamination should be taken. (Kramer-FIRL)

AEROBIC PHOTODEGRADATION OF FE(III)--ETHYLENEDINEITRILO)TETRAACETATE (FERRIC EDTA): IMPLICATIONS FOR NATURAL WATERS,
Eastman Kodak Co., Rochester, N.Y. Health and Safety Lab.
H. B. Lockhart, and R. V. Blakeley.
Environmental Science and Technology, Vol. 9, No. 12, p. 1035-1038, 1975. 7 fig., 1 tab., 13 ref.

Descriptors: *Iron, *Irradiation, *Degradation(Decomposition), Chemical reactions, Nitrilotriacetic acid, Chelation, Hydrogen ion concentration, Biodegradation, Photosynthesis.
Identifiers: *Photodegradation, Photolysis.

Fe(III)-(ethylenedinitrilo)tetraacetate (ferric EDTA) which is used in photographic processing solutions and fertilizers, may be reaching the environment. It is a thermodynamically stable chelate. Its removal from the environment by interaction with sunlight (Photodegradation) was studied by the behavior of aqueous solutions of 1-C14-ferric EDTA at pH 4.5, 6.9, and 8.5 when irradiated. Carbon dioxide, formaldehyde, N-carboxymethyl-N, N'-ethylene-diglycine, N,N'-ethylenediglycine, iminodiacetic acid, N-carboxymethyl-N-aminoethyleneglycine, N-aminoethyleneglycine, and glycine were identified as the major photodegradation products. Nitrilotriacetic acid was not detected. The photolysis rate was pH dependent; it was most rapid at pH 4.5. With a light intensity of 4000-ft candles and an initial concentration of 0.0006 M, ferric EDTA removal was complete after 24 hours of irradiation at pH 4.5 or 6.9 and after 32 hours at pH 8.5. The results showed a significant photosensitivity over the pH range of natural waters. Possible schemes for photodegradation of ferric EDTA at pH 4.5 and pH 6.9-8.5 are suggested, based on the time various photodegradation products were first detected and their relative concentrations. Photodegradation may play a significant role in the removal of ferric EDTA from natural waters. Fer-

ric EDTA biodegradation and interaction with suspended matter and sediments may also affect the ferric EDTA concentration and removal rate. (Buchanan-Davidson--Wisconsin)
W76-07096

STUDIES ON METABOLIC ACTIVITY OF PLANKTONIC BACTERIA ISOLATED FROM THREE LAKES,
Nicolas Copernicus Univ. of Torun (Poland). Lab. of Microbiology.
E. Strzelczyk, M. Stopinski, and W. Donderski.
Acta Microbiologica Polonica, Ser. B., Vol. 7, No. 3, p. 177-183, 1975.

Descriptors: *Metabolism, *Bacteria, *Lakes, Respiration, Carbohydrates, Amino acids, Trophic level, Organic matter, Europe, *Eutrophication, Plankton.
Identifiers: Lake Jeziorak(Poland), Lake Tynwald(Poland), Lake Jasne(Poland), Glucose, Arabinose, Xylose, Fructose, Ribose, Maltose, Cellobiose, Starch, *Poland.

Bacteria were studied on nine substrates which occur naturally. Of 480 strains isolated from three Polish lakes, all except one used casamino acids. Amino acids were less important for planktonic bacteria from mesotrophic than from eutrophic lakes inasmuch as eutrophic lakes favored development of algae and vascular plants which excreted amino acids. More planktonic than benthic bacteria used amino acids and metabolized them more rapidly. Glucose was the most frequently attacked carbohydrate. More bacteria unable to utilize carbohydrates were found in all lakes in January and April, and fewer in August and October. Arabinose and xylose were the least readily utilized. Glucose and fructose were attacked by more benthic than planktonic bacteria, but benthic bacteria were metabolically less active. More planktonic bacteria could use arabinose, ribose, maltose, cellobiose, and starch. The metabolic activities and abilities of bacteria to use carbon and energy sources depended on time of isolation and varied in the different lakes. Water and bottom deposits from lakes of different trophic states contained bacteria with different metabolic activities which could attack different organic substances. The number of organisms in water and mud varied seasonally. (Buchanan-Davidson--Wisconsin)

EFFECT OF ANAEROBIC CONDITIONS IN BOTTOM WATERS ON THE OCCURRENCE OF RED TIDES AT OMURA BAY,
Nagasaki Univ. (Japan). Faculty of Fisheries.
K. Hirayama, and S. Iizuka.
Environmental Letters, Vol. 9, No. 2, p. 167-178, 1975. 3 fig., 16 ref.

Descriptors: *Hypolimnion, *Gymnodinium, *Anaerobic conditions, *Red tide, Dinoflagellates, Algae, Sea water, Bottom sediments, Nutrients, Asia.
Identifiers: *Omura Bay(Japan).

Gymnodinium red tides in Omura Bay, Japan, occur in July after the rainy season before the bottom in the center of the bay becomes anoxic; the plankton initially grow at the surface of branch inlets. Red tides also occur in September when anoxic conditions develop in bottom water in the center of the bay; the dinoflagellates grow initially in bottom or middle layers around oxygen-depleted water. The relation of anoxic bottom water to red tide development was investigated. Unenriched sea water collected in early July before oxygen deficiency had developed couldn't support Gymnodinium growth. They grew more in sea water collected from late July to late August when bottom waters were becoming anaerobic. Growth occurred in sea water collected early in July if inorganic nutrients were added. When all nutrients in Wilson-Collier medium were added, growth was higher than in cultures with added inorganic nutrients only. An increased supply of inorganic nutrients to sea water was needed to develop a red tide. These nutrients originated in bottom mud under anaerobic conditions. Development of oxygen deficiency in bottom waters makes the environment favorable for growth of Gymnodinium by supplying inorganic nutrients and other unknown stimulants from bottom mud. (Buchanan-Davidson--Wisconsin).

ZOOPLANKTON DIVERSITY IN FOUR NORWEGIAN FJORDS,
Trondheim Univ. (Norway). Biological Station.
T. Stromgren.
Sarsia, Vol. 59, p. 15-30, 1975. 4 fig., 7 tab., 30 ref.

Descriptors: Zooplankton, *Fjords, *Correlation analysis, Copepods, Depth, Seasonal, Spatial distribution, Discharge(Water), Estuarine environment, Inflow, Dominant organisms, Europe.
Identifiers: *Zooplankton diversity, Diversity indices, Shannon-Wiener index, Simpson index, Margalef index, *Norway.

Seasonal and spatial differences in zooplankton diversity were studied in four Norwegian fjords which differed in latitude, topography, hydrography, and hydroclimatic conditions, but similar compositions. Correlations between Shannon-Wiener and Simpson indices and between the Simpson index for copepods and holoplankton were found but there were discrepancies with Margalef's index, especially in the upper 100 meters. Increases in diversity at 1-100 meters and decreases in deeper layers in Trd, coinciding with spawning of Calanus finmarchicus and outflow in upper layers. There was an increase in Simpson's index for copepods outwards in the upper 100 meters in Hardangerfjorden, Trodhondheimsfjorden and Skjomen were observed, coinciding with spawning of Calanus finmarchicus and outflow in upper layers. There was an increase in Simpson's index for copepods outwards in the upper 100 meters in Hardangerfjorden, Trondheimsfjorden, and Skjomen in October-June, related to increasing estuarine conditions toward their centers. Similar correlations for July-September showed an opposite pattern in Trondheimsfjorden and Skjomen with decreasing diversity otwards related to coastal water inflow. Below 100 meters divesity decreased toward the outer parts of Trondheimsfjorden, possible due to deep inflows which may be related to reduced diversity. Diversity decreases from south-north were related to factors such as water exchange rates rather than factors associated with latitude. There was a negative correlation between average monthly diversity and standard deviation, indicating that a community with low diversity had the largest variations in diversity. (Buchanan-Davidson--Wisconsin).
W76-07102

AERATION AS A LAKE MANAGEMENT TECHNIQUE,
Wisconsin Dept. of Natural Resources, Madison.
S. A. Smith, D. R. Knauer, and T. L. Wirth.
Technical Bulletin No. 87, 1975. 40 p. 19 fig., 7 tab., 108 ref.

Descriptors: *Aeration, *Hypolimnion, *Lakes, *Eutrophication, *Management, Bubbles, Dissolved oxygen, Equipment, Design, Destratification, *Wisconsin, Thermal stratification, Nutrient removal, Seasonal, Anaerobic conditions.
Identifiers: *Lake rehabilitation, Mirror Lake(Wis), Larson Lake(Wis).

Feasibility of hypolimnetic aeration for lake restoration was demonstrated in two eutrophic Wisconsin lakes. Hypolimnetic aerators consisted of polyethylene tubes with internal twisted longitudinal plates. Compressed air or compressed air-liquid oxygen were supplied and water air-lifted through the tube to a bubble separation box at the surface. Bubble-free oxygenated water was returned to the hypolimnion. Osygen transfer from the compressor occurred in the bottom of the unit and the surface separation box. Total dissolved oxygen transfer efficiency was 20% with air and 23% with compressed air-liquid oxygen in Mirror Lake and 12-14% with air in Larson Lake. In summer both lakes had anoxic hypolimnia. Only Mirror Lake's high oxygen demand was not satisfied. Establishment of a cold water trout fishery in Larson Lake's hypolimnion appeared possible. Reliable oxygen uptake rate estimates are needed. Hypolimnetic aeration improved the dissolved oxygen without altering the thermal regime and eliminated rapid hypolimnetic nutrient recycling. In winter, hypolimnetic aeration improved dissolved oxygen conditions and had a positive effect on nutrients. In Mirror Lake total aeration in spring and fall supplemented hypolimnetic aeration. In Larson Lake, a depth-adjusted total aeration system plus hypolimnetic aeration may reduce the thickness of the anoxic metalimnion. (Buchanan-Davidson--Wisconsin).
W76-07103

NUTRIENTS AND PRIMARY PRODUCTION IN A WARM WATER STREAM,
Michigan State Univ., East Lansing. Inst. of Water Research.
M. L. Brehemer, R. C. Ball, and N. R. Kevern.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-242 113, $5.00 in paper copy, $2.25 in microfiche. Technical Report No. 4, Red Cedar River Series (MSU-IWR-TR-69-0004) September 1969. 89 p. 22 fig., 6 tab., 55 ref.

Descriptors: *Nutrients, *Primary productivity, *Rivers, *Periphyton, *Michigan, Dissolved oxygen, Water temperature, Hydrogen ion concentration, Aquatic plants, Phosphorus compounds, Nitrogen compounds, Nutrient removal, Sewage effluents, Chemical reactions, Chemical precipitation, Degradation(Decomposition), Plant pigments, Physical properties, Turbidity, Standing crops.
Identifiers: *Red Cedar River(Mich), Nutrient sources, Williamston(Mich), Warm-water stream.

Major nutrient sources and relationships between primary production and nutrient levels were studied in the Red Cedar River, Michigan. Dissolved nutrients varied with stream flow, water temperature, and primary production levels. The largest nutrient influx from tributary streams occurred shortly after a rainstorm and the concentration decreased rapidly suppressing aquatic flora activity; most nutrients were lost without producing a biological response. Most phosphorus and nitrogen came from municipal drains and sewage treatment plant effluents. Nutrients were removed by biological uptake, chemical adsorption, or precipitation within 0.6 mile downstream. Biologically combined phosphorus was released by periphyton decomposition when stream tempera-

tures were high and flow normal. The periphyton organic phosphorus to phytopigment ratio decreased with distance from outfall, indicating that the flora stored more than normal amounts of phosphorus. Normally periphyton production increased rapidly from ice cover to May, then decreased until winter, but production could be altered by annual rainfall. Biological responses to nutrients were greatest during high production periods and shifted downstream with increasing water temperature. Nitrogen limited periphyton production and caused dissolved phosphorus accumulation downstream. Adverse physical conditions (high stream flow and turbidity) can destroy the periphyton standing crop, but the flora was rapidly reestablished with normal stream conditions. (Buchanan-Davidson--Wisconsin).
W76-07104

THE EFFECT OF MICROORGANISMS ON PHYTOTOXICITY OF HERBICIDES. III. INTERACTION OF BACILLUS SP. 72 WITH VENZAR,
Wroclaw Univ. (Poland). Dept. of Microbiology.
N. Balicka, J. Lubczynska, and T. Wegrzyn.
Acta Microbiological Polonica, Ser. B, Vol.7, No. 3, p. 151-156, 1975. 5 fig., 6 ref.

Descriptors: *Microorganisms, *Herbicides, *Phytotoxicity, Pesticide toxicity, Phenols, Bacteria, Cultures, Chemical reactions, Ammonia, Hydrogen ion concentration, *Path of pollutants.
Identifiers: *Venzar, *Bacillus, *Flavonoids.

The interaction between the phenolic metabolites of Bacillus sp. 72 and the herbicide Venzar (3-cyclohexyl-5,6-trimethylenuracil) were studied. The interaction depended on the incubation conditions. Bacterial metabolic pathways differed in shaken and stationary cultures; growth rates did not vary, but production of ammonium ion and phenolic compounds reacting with the Folin reagent was higher in stationary cultures. The pH was about 7.0 in stationary cultures and 5.0 in shaken cultures, and their phenolic metabolites were different. The phenolic compounds produced by Bacillus sp. 72 were flavonoids which could change their chemical structure depending on aeration and hydrogen ion concentration. The ability of stationary cultures to increase Venzar phytotoxicity was greater than that of shaken cultures. Interactions between Venzar and the supernatants were observed. Venzar action appeared to depend on the ammonium ion concentration; when ammonia was evaporated, Venzar phytotoxicity decreased. Two flavonoids, separated by chromatography, interacted with Venzar and enhanced its phytotoxicity. When Venzar was added to cultures, it lost some of its activity after a six day incubation. When Sinapis alba was incubated with Venzar and bacteria, the bacteria appeared to reduce the herbicidal activity. (Buchanan-Davidson--Wisconsin).
W76-07105

INHIBITORS PRODUCED BY ALGAE AS AN ECOLOGICAL FACTOR AFFECTING BACTERIA IN WATER. II. ANTIBACTERIAL ACTIVITY OF ALGAE DURING BLOOMS,
Warsaw Univ. (Poland). Dept. of Environmental Microbiology.
R. J. Chrost.
Acta Microbiological Polonica, Ser. B, Vol. 7, No. 3, p. 167-176, 1975. 2 fig., 3 tab., 24 ref.

Descriptors: *Bactericides, *Algal toxins, *Plant growth substances, Bacteria, *Eutrophication, Peptides, Euphotic zone, Light penetration, Enteric bacteria, Extraction, Nuisance algae, Pyrrophyta, Cyanophyta, Oxygen requirements, Respiration, Microbial degradation, Inhibition.
Identifiers: *Gram positive bacteria, Bacillus subtilis, Staphylococcus aureus, Bacillariophyceae, Bacillus, Bacterium, Caccus.

Algal bactericidal exudates and their effects on biodegradation were investigated. During algal blooms Gram positive bacteria were eliminated, but generally Gram negative rods were unaffected (especially Pseudomonas and Enterobacteriaceae). Gram positive Bacillus subtilis and Staphylococcus aureus were the most sensitive to the effect of phytoplankton bloom extracts. Inhibition of bacterial growth by phytoplankton extracts (Bacillariophyceae, Pyrrophyta, and Cyanophyta) was stronger in the light than the dark. Little growth inhibition was observed in the light with Gram negative Pseudomonas II, Flavobacterium, and Achromobacter-Alcaligenes. Algal extracts reduced oxygen uptake of Gram positive bacteria partially in the dark but more so in the light. Gram negative bacteria were inhibited a little in the light. Pseudomonas IV and Enterobacteriaceae were resistant to algal toxins. The most active inhibitors of respiration were produced by blue-green algae. Many Gram negative bacteria resistant to algal extracts used more oxygen in samples with extracts than controls; a few exhibited inhibition of respiration. Lake water collected during a Microcystis bloom inhibited Bacillus subtilis, showing that algae excreted inhibitors during growth. Inhibition of organic matter decomposition by phytoplankton bloom extracts occurred in the euphotic zone, but not the profundal zone, indicating dependance on light. (Buchanan-Davidson--Wisconsin)

PROCESSES CONTROLLING THE DISSOLVED SILICA DISTRIBUTION IN SAN FRANCISCO BAY,
Geological Survey, Menlo Park, Calif.
D. H. Peterson, T. J. Conomos, W. W. Broenkow, and E. P. Scrivani.
Estuarine Research, Vol. 1, p. 153-187, 1975. 21 fig., 1 tab., 73 ref.

Descriptors: *Estuaries, *Silica, *Dissolved solids, *Bays, Spatial distribution, *California, Temporal distribution, Estuaries, Rivers, Mixing, Water circulation, Sea water, Inflow, Recycling, Phytoplankton, Salinity.
Identifiers: *San Francisco Bay(Calif), Sacramento River(Calif), San Joaquin River(Calif).

Relationships between seasonal dissolved silica variations and insolation and river discharge effects in the San Francisco Bay estuarine system were studied, especially longitudinal (river to ocean) dissolved silica variations associated with estuarine circulation. Dissolved silica is primarily supplied to the bay by river inflow and ocean water. Its distribution differs from that of phosphate, nitrate, and ammonia because human input and recycling by estuarine siliceous phytoplankton dissolution are minor dissolved silica sources. Variations in distribution are seasonal and related to variations in river supply and phytoplankton utilization. When the rate at which river inflow supplies silica to the bay is large compared to the rate silica is used in the estuary, the dissolved silica decrease as salinity increases is primarily controlled by mixing river and ocean waters. When dissolved silica utilization increases compared to supply, estuarine dissolved silica concentration is less than predicted by simple mixing and lower than in near-surface ocean water. Phytoplankton influence on dissolved silica concentration in the bay depends on water retention time in the estuary. River discharge modulates seasonal variations in estuarine water replacement time and dissolved silica supply. When river discharge is high, rapid dissolved silica utilization does not significantly influence its distribution. (Buchanan-Davidson--Wisconsin).

PATHOGENIC MICROORGANISMS IN THE ENVIRONMENT,
Agricultural Research Service, Beltsville, Md.; and Animal and Plant Health Inspection Service, Beltsville, Md.
G. B. Van Ness.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes - 1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 19-21.

Descriptors: *Pathogenic bacteria, *Livestock, *Water pollution, *Public health, *Farm wastes, Microorganisms, *Animal diseases, Waste treatment, Ureas.
Identifiers: Parasites.

Infectious diseases of livestock which are spread through manure and urine are the problems of herd management, unless the infectious agent also survives in the environment, and becomes a pollutant of other premises. Spread to other premises depends on biological properties inherent in the pathogenic organisms. In pollution control, there is need to give attention to some organisms, while others may be of little concern. Pathogens which can grow and multiply in the environment are very important pollutants. Some pathogens persist in the environment. Some virus pathogens are able to survive longer in the environment than do others, and can be dangerous pollutants. Some livestock parasites in animal wastes are also dangerous water pollutants. (See also W76-07154) (East Central)

DYNAMIC BEHAVIOR OF VINYL CHLORIDE IN AQUATIC ECOSYSTEMS,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
J. Hill, IV, H. P. Kollig, D. F. Paris, N. L. Wolfe, and R. G. Zepp.
Available from the National Technical Information Service, Sprinfield, Va 22161, as PB-249 302, $4.50 in paper copy, $2.25 in microfiche. Report EPA-600/3-76-001, January 1976. 63 p, 26 fig, 4 tab, 45 ref. 1BA023, ROAP 04AEM; Task 005, ROAP 03ACO, Task 009.

Descriptors: Systems analysis, Ecosystems, Chlorides, Model studies, *Biodegradation, Distribution, Aquatic environment, *Chemical degradation, *Simulation analysis.
Identifiers: *Vinyl chloride.

To evaluate the behavior of vinyl chloride in aquatic ecosystems, best estimate and worst case models of lake and stream ecosystems were analyzed through the use of mathematical simulation. The characteristics of the chemical, biological, and physical transformations of vinyl chloride indicated in the models were determined by laboratory experimentation and extrapolation of reaction data for similar compounds. These transformations included oxidation, substitution, elimination, hydrolysis, and free radical reactions; complexation; direct and indirect photochemical reactions; microbial degradation and toxicity; bacterial, algal, and fungal sorption; and volatilization. Loss of vinyl chloride from the aquatic environment by volatilization appeared to be the most significant process in its distribution. (EPA)

TOXAPHENE EFFECTS ON REPRODUCTION, GROWTH, AND MORTALITY OF BROOK TROUT,
Fish and Wildlife Service, Columbia, Mo. Fish Pesticide Research Lab.
F. L. Mayer, Jr., P. M. Mehrle, Jr., and W. P. Dwyer.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-249 383, $4.50 in paper copy, $2.25 in microfiche. Report EPA-600/3-75-013, November 1975. 42 p, 2 fig, 1 tab, 69 ref. 1BA021 (ROAP/Task 16AAK), EPA IAG-0153(D)

Descriptors: *Growth rates, *Brook trout, *Fish reproduction, Life cycles, *Mortality, Water pollution effects, Pesticides, Life cycles, Trout, *Pesticide residues, Insecticides.
Identifiers: *Toxaphene, Collagens, Chronic effects, Continuous exposure, Partial life cycle.

Yearling brook trout (Salvelinus fontinalis) were continuously exposed to toxaphene (0, 39, 68, 139, 288, and 502 ng/l) in a flow-through diluter system. Day length and water temperature were altered monthly to correspond to natural conditions. Adult growth was reduced in the 288 and 502 ng/l toxaphene exposures, and the added stress of spawning activities caused extensive mortalities in these concentrations. The numbers of eggs spawned and percent viability were inversely related to increasing toxaphene concentrations. All groups of fry exposed to toxaphene had reduced rates of growth and survival. Biochemical investigations on fry backbones demonstrated that bone collagen may be a sensitive indicator of normal and abnormal growth and development prior to being observed in the whole fish. Toxaphene was accumulated by brook trout 5,000 to 76,000 times that in the water and the more chlorinated isomers of toxaphene were preferentially stored. (EPA)

COMPARATIVE PRIMARY PRODUCTIVITY OF TWO FLOOD CONTROL RESERVOIRS IN THE SALT VALLEY WATERSHED OF EASTERN NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Zoology.
J. L. Andersen, and G. L. Hergenrader.
Trans Nebr Acad Sci. 2, p 134-143, 1973.

Descriptors: *Reservoirs, Productivity, *Primary productivity, *Secchi disks, *Chlorophyll, Light penetration, Turbidity, Cyanophyta, Eutrophication, Sedimentation, Flood control, *Nebraska, Cyanophyta, *Nutrients.
Identifiers: Salt Valley Watershed(Neb).

Primary productivity, Secchi disc visibility, chlorophyll, and nutrient concentrations were studied in Wagon Train and Stagecoach reservoirs during the yr 1969 and 1970. The reservoirs are separated by a distance of only 12 km and are similar in nutrient content and circulation pattern. Furthermore, in both reservoirs 92-100% of the productivity occurs in the upper 2m. However, the reservoirs differ markedly in their underwater light conditions and, consequently in their primary productivity. Wagon Train Reservoir is turbid due to suspended silt and clay particles while Stagecoach Reservoir lacks this turbidity. During the summer months, blue-green algal blooms occur frequently in Stagecoach Reservoir but only rarely in Wagon Train Reservoir. This appears to be due to the rapid attenuation of the light by the suspended silt and clay particles. In Wagon Train Reservoir, increased primary productivity is usually associated with increased Secchi disc visibility, while in Stagecoach Reservoir, increased primary productivity is often associated with decreased Secchi depths. Inorganic turbidity is an important factor affecting the productivity of Wagon Train Reservoir while algal production itself determines turbidity in Stagecoach Reservoir. Annual productivity in both study reservoirs, when compared to published values for carbon uptake from the other lakes and reservoirs, rates very high. Stagecoach Reservoir fixed 530 g C/m2/yr in 1969 and 834 g C/m2/yr in 1970. Wagon Train Reservoir increased from 148 g C/m2/yr, in 1969, a yr of high inorganic turbidity, to 453 g C/m2/yr in 1970, a yr of reduced inorganic turbidity.--Copyright 1974, Biological Abstracts, Inc.

MESOPHILIC CLOSTRIDIA IN PUGET SOUND,
Washington Univ., Seattle. Inst. for Food Science and Technology.
J. R. Matches, and J. Liston.
Can J Microbiol. 20(1), p 1-7, 1974.

Descriptors: *Clostridium, *Sediments, Sand, Gravel, Mud, *Washington, Mesotrophy, Bacteria, Microorganisms, Anaerobic bacteria.
Identifiers: Clostridium-bifermentans, Clostridium-novyi, Clostridium-perfringens, *Mesophilic clostridia, *Puget Sound(Wash).

Clostridia were isolated from marine sediments collected in Puget Sound in the State of Washington. Sampling stations varied in depth from 10-240 m and sediment types varied from sand and gravel to reduced mud. Counts of bacteria growing both aerobically and anaerobically at 30C were made. Aerobic and anaerobic counts were 1.21 to 16.9 x 10,000 and 0.73 to 23.5 x 10,000 cells/ml of sediment-water slurry respectively. About 30% of the bacteria growing anaerobically were obligate anaerobes and identified as clostridia. The identified clostridia fell into 12 groups. The 1st 3 groups, containing Clostridium perfringens, C. bifermentans and C. novyi, made up 76% of the isolates. A variety of species of mesophilic clostridia were found in marine sediments with C. perfringens isolated in the highest numbers.--Copyright 1974, Biological Abstracts, Inc.

WATER QUALITY AND BIOASSAY STUDY FROM CRAWFORD NATIONAL FISH HATCHERY,
Chadron State Coll., Nebr.
J. E. Taylor.
Trans Nebr Acad Sci. 2, p 176-181, 1973.

Descriptors: Fish hatcheries, Trout, *Rainbow trout, *Brown trout, *Bioassay, *Water quality, Toxicity, Pollutant identification, Acidity, Alkalinity, Ammonia, Hardness(Water), Oxygen, Nitrates, Nitrites, Temperature, Turbidity, Carbon, *Nebraska, Hydrogen.
Identifiers: Salmo-Trutta, Crawford National Fish Hatchery(Neb).

Water from Crawford National Fish Hatchery, Crawford, Nebraska, is of high quality for rearing rainbow (Salmo gairdnerii) and brown trout (S. trutta). Analyses were conducted for 2 mo. during the summer of 1971 with mean results as follows: Acidity 16 mg/l, alkalinity 202 mg/l, ammonia 0.6 mg/l, Ca hardness 201 mg/l, CO2 23 mg/l, dissolved O2 8 mg/l, nitrates 6 mg/l, nitrites 0.02 mg/l, pH 7.6, temperature 16C, and turbidity 4.6 J.T.U. Bioassay studies indicated lethal concentrations of ammonia and CO2 to brown trout to be 12 mg/l and 1.50 mg/l, respectively.--Copyright 1974, Biological Abstracts, Inc.

EUTROPHICATION OF SMALL RESERVOIRS IN EASTERN NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
M. J. Hammer, and G. L. Hergenrader.
Trans Nebr Acad Sci. 2, p 70-80, 1973.

Descriptors: *Reservoirs, *Eutrophication, *Nebraska, Recreation, Turbidity, Light penetration, Algae, Cyanophyta.
Identifiers: Salt Valley.

Numerous small reservoirs constructed in Nebraska are used for recreation and many more are being planned. While these impoundments seemingly alleviate the long standing need for recreational waters, many existing impoundments exhibit symptoms of accelerated eutrophication after only a few years of existence. It is natural that such lakes, impounding nutrient-rich water, should be productive and generate nuisances that interfere with projected recreation uses. Neither this fact nor the lack of feasible methods for nutrient control were perceived prior to providing recreational facilities at the reservoir sites. Rates of eutrophication, nutrient sources and eutrophication control have been examined in a study of 5 eastern Nebraska reservoirs. Runoff waters impounded in the Salt Valley reservoirs have sufficient nutrient salts to support abundant growths of aquatic plants; reservoirs that are light-limited by soil turbidity support neither abundant growths of aquatic plants nor dense blue-green algal blooms; clear water reservoirs are very eutrophic--shorelines choked with rooted aquatics, dense blooms of blue-green algae, odorous emissions and occasional fish kills are typical characteristics of these impoundments; and in clear water reservoirs the rate of eutrophication is very rapid and appears to be directly related to age. Projections based upon existing data indicate that the useful life of these reservoirs for body-contact recreation is only a few years.--Copyright 1974, Biological Abstracts, Inc.

ICHTHYOPHTHIRIASIS IN THE MIRROR CARP CYPRINUS CARPIO (L.): IV. PHYSIOLOGICAL DYSFUNCTION,
Agricultural Research Organization, Dor (Israel). Fish and Aquaculture Station.
R. S. Hines, and D. T. Spria.
J Fish Biol. 6(4), p 365-371, 1974.

Descriptors: *Fish parasites, *Carp, *Fish diseases.
Identifiers: Blood analysis, Ichthyophthiriasis, Ichthyophthirius-Multifiliis, Mirror Carp.

Changes in blood ion concentration, O2 absorption, blood Hb concentration and blood urea-ammonia N level were measured in a group of mirror carp infected with measured numbers of Ichthyophthirius multifiliis under standardized conditions. The disease was characterized by a drop in serum Na and Mg and increase in serum K. The ability of infected fish to absorb O2 was reduced as was their ability to tolerate dissolved O2 concentrations under 5 ppm. Blood urea-ammonia level was elevated during the disease but blood Hb level remained unchanged. (See also W76-07262; W74-13397 and W76-01410)--Copyright 1974, Biological Abstracts, Inc.

ICHTHYOPHTHIRIASIS IN THE MIRROR CARP CYPRINUS CARPIO (L): V. ACQUIRED IMMUNITY,
Agricultural Research Organization, Dor (Israel). Fish and Aquaculture Station.
R. S. Hines, and D. T. Spira.
J Fish Biol. 6(4), p 373-378, 1974.

Descriptors: *Fish parasites, *Carp, *Fish diseases.
Identifiers: *Cyprinus-Carpio, *Ichthyophthiriasis, *Ichthyophthirius-Multifiliis, *Immunity, Mirror carp.

Mirror carp (C. carpio L.) infected with sublethal doses of Ichthyophthirius multifiliis, were free of parasites 21 days after infection. Fish remained free of parasites for at least 8 mo. when maintained in an infective environment. Such fish were refractory to reinfection with numbers of parasites that killed all normal, previously unexposed fish. Serum from fish recovered from previous infections with sublethal doses of parasites, immobilized free-swimming stages of I. multifiliis to a dilution of up to 1 :1024. The rise in serum-immobilization titer occurred between the 10th and 22nd days

of infection, the period during which parasites disappeared from the body surface of the fish. Infective stages of the parasite were unable to penetrate the mucus body covering of resistant fish. (See also W76-07261; W76-01410 and W74-13397)--Copyright 1974, Biological Abstracts, Inc.

CARP TRIETHYL CHLORIDE ABSORPTION FROM WATER; ITS DISTRIBUTION IN ORGANS AND TISSUES, (IN RUSSIAN),
Moscow State Univ., (USSR).
N. S. Stroganov, O. V. Parina, and K. F. Sorvachev.
Gidrobiol ZH. 9(6), p 59-66, 1973.

Descriptors: Carp, Absorption, Chlorides, Water pollution effects.
Identifiers: Triethyl chloride.

Triethyl chloride (TEC) was highly specific in its occurrence in the organs and tissues of carp Cyprinus Carpio. Essential accumulations were found in soft tissues, such as liver, brain, kidneys and red muscles. The value of TEC accumulation is a function of its concentration in water and time. The higher the concentration used, the higher the absolute and lower the relative TEC accumulation rates. Especially large quantities of TEC quickly accumulate in the bile. In the blood TEC accumulation is fairly restricted to the erythrocytes. The most affinity for TEC is shown by lipids and glycogen of the liver, brain and red muscles, the least, by white muscles.--Copyright 1974, Biological Abstracts, Inc.

MICROBIOLOGICAL PRODUCTION OF HYDROGEN SULPHIDE IN THE VEISOVO LAKE (SLAVYANSK LAKES), (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institute Biochemistry, Physiology and Microorganic.
E. N. Chebotarev, V. M. Gorlenko, and V. I. Kachalkin.
Mikrobiologiya. 43(2), p 231-325, 1974.

Descriptors: Microbiology, Photosynthesis, Production, Bacteria, *Eutrophication, Reservoirs, *Primary productivity, Sulfates, Lakes, *Hydrogen sulfide, Organic matter.
Identifiers: Ukrainian-SSR, Ooze, Bottom deposits, *USSR(Lake Veisovo), Sulfate reducing bacteria.

Lake Veisovo (Uhicunidan, SSR, USSR) is an eutrophic reservoir with primary production of organic matter by photosynthesis up to 800 micro C/1/day. The content of sulphates was high in water and bottom deposits. The rate of production of H2S was higher in ooze than in water: 2.0-19.0 and 0.02-0.08 mg H2S/day/kg of wet ooze or 1 l of water, respectively. Sulphate reducing bacteria were found everywhere in the water and in the bottom deposits; the maximum content was 150.10 sup 6 cells/l in the upper layer of ooze.--Copyright 1975, Biological Abstracts, Inc.

SEASONAL DYNAMICS OF BACTERIOPLANKTON OF THE KAPCHAGAL RESERVOIR IN THE THIRD YEAR OF ITS FILLING, (IN RUSSIAN),
N. K. Gulaya, and N. L. Tyuten'kova.
Izv Akad Nauk Kaz SSR Ser Biol. 12(2), p 40-45, 1974.

Descriptors: *Bacteria, Plankton, *Primary productivity, *Phytoplankton, *Decomposing organic matter, Reservoirs, Seasonal.
Identifiers: Kazakh-SSR, USSR(Kapchagal Reservoir).

Observations were made on the seasonal dynamics of bacterioplankton, primary production of phytoplankton and degradation of organic matter in the 3rd year of filling of the Kapchagai reservoir in Kazakh SSR (USSR). Certain patterns were established in the distribution of bacterioplankton and intensity of production and breakdown of organic matter in different areas of the reservoir and in different seasons. The activity of production and degradation of organic matter and the abundance of bacterioplankton decreased in the 3rd year.--Copyright 1975, Biological Abstracts, Inc.

THE EUTROPHICATION OF THE TITISEE AND ITS CONSEQUENCES FOR THE POPULATION DYNAMICS OF ZOOPLANKTON: I, (IN GERMAN),
E. Szymanski-Bucarey.
Arch Hydrobio Supplement b. 47(1), p119-166, 1974.

Descriptors: *Eutrophication, *Zooplankton, *Anabaena, Lakes, *Nitrates, *Phosphates, Reproduction.
Identifiers: Acanthodiaptomus-Denticornis, Anabaena-Flos-Aquae, Bosmina-Coregoni, Cyclops-Abyssorum, Diaphanosoma-Brachyurum, Germany, Mixodiaptomus-Laciniatus, *Titi Lake.

Eutrophication in Titi Lake has increased rapidly for the last few years: the periodic blooming of Anabaena flos-aquae, makes the process apparent. The main cause of the eutrophication of the lake is the increase of nitrates and phosphates. The content of nitrate is shown to have doubled and the phosphate content to be 10 times its original amount. Phosphate is the limiting factor. The Bosmina coregoni and Diaphanosoma brachyurum population decreases notably. Mixodiaptomus lacinatus lays its eggs earlier in the year and the development of the nauplius stages takes longer, overlapping that of the Acanthodiaptomus denticornis population. The population dynamics of Cyclops abyssorum in Titi Lake were studied for the 1st time.--Copyright 1975, Biological Abstracts, Inc.

MICROZOOPLANKTON OF LAKES OBELIJA, SLAVANTAS, GALSTAS AND DUSIA, (IN RUSSIAN),
Akademiya Nauk Litovskoi SSR, Vilnius. Institut Zoologii i Parizitologii.
S. I. Mazheikaite.
Liet Tsr Mosklu Akad Darb Ser C Biol Moksai. 4, p113-123, 1973.

Descriptors: *Zooplankton, *Lakes, Seasonal, Protozoa, *Water temperature.
Identifiers: Dusia, Galstas, Obelija, Slavantas, *USSR(Lithuania).

The microzooplankton of the lakes in south Lithuania (USSR) is rich in quality and quantity. Constituting more than 95% of the total density, Infusoria dominates among planktonic protozoa. The quantitative development of microzooplankton depends on ecological factors, particularly on the water temperature. In the upper layers of water the maximum development of microzooplankton took place in summer, the minimum in winter; in the deep layers it took place in each lake differently. In summer the abundance of planktonic protozoa in the upper layer of Lake Obelija reached 2.5-4.5, x 10 to the third power/l Lake Slavantas 3.0 x 10 to the third power/l Lake Galstas 0.4-0.7, x 10 to the third power/l and in Lake Dusia 1.5-1.6 x 10 to the third power/l.--Copyright 1975, Biological Abstracts, Inc.

K. K. Yankyavichyus, A. Yu. Baranauskene, and R. I. Razyulite.
Liet Tsr Mosklu Akad Darb Ser C Biol Mokslai. 4, p11-19, 1973

Descriptors: *Bacteria, Aquatic plants, Plankton, Cladophora, Ecosystems, Ecology.
Identifiers: *Chara-Aspera, *Cladophora-Glomerata.

Benthic plankton Chara aspera, Cladophoraglomerata is a serious rival for bacterial flora when using food substances in freshwater ecosystems. Bacterial numbers, generation period and mineralization intensity depend on the hydrochemical regime. Very often, P shortage is a limiting factor in the biochemical activity of bacteria. Benthic plankton may be used when choosing apparatus for the elimination of biogenous element concentrations, thus slowing the development of planktonic organisms.--Copyright 1975, Biological Abstracts, Inc.

INFLUENCE OF FLOODING ON PH, OXIDATION-REDUCTION POTENTIAL AND SOIL PHOSPHORUS AVAILABILITY, (IN PORTUGUESE),
Instituto de Pesquisas e Experimentacao Agropecuarias do Sul, Pelotas (Brazil).
J. V. Moraes.
Pesqui Agropecu Bras Ser Agron. 8(7), p93-101, 1973.

Descriptors: *Flooding, Hydrogen ion concentration, Soils, Phosphorus, Oxidation-reduction potential, Waterlogging, Soil temperature, Fertilizers.

Four soils and 4 levels of P (0, 40, 80 and 120 kg/ha) were used with the objective of studying the influence of waterlogging on pH, redox potential (Eh) and P availability. The pH, the Eh the P of the soil solution and P extracted from soil by an anion exchange resin were determined every 7th day during the flooding period. The pH of the acid soils increased and the pH of the alkaline soil decreased after inundation. In both cases the final values were 6.5-7.0. The redox potentials of the soils changed remarkably after waterlogging. The Eh of the soils decreased rapidly for the 1st wk of submergence followed by a slow decrease during the 5th-7th wks, at which time Eh values became stable, between -200 and -300 mV. P applied to soil as a fertilizer was fixed at the beginning of the flooding. Availability increased only after pH and Eh changes had taken place. Both extracted and soil solution P increased with time of inundation. Correlation coefficients between these 2 forms of P were 0.91, 0.85, 0.90 and 0.88, respectively, for the soils La Granja loam, Mesillas clay, Hogamacho clay and Piedras Negras clay. Soil temperature influenced the velocity of changes on pH, Eh and P availability.--Copyright 1975, Biological Abstracts, Inc.

SEVERAL ASPECTS OF BACTERIOLOGIC POLLUTION IN MOLLUSK-PRODUCING WATERS OF ALGARVE, (IN FRENCH),
Instituto de Biologia Maritima, Lisbon (Portugal).
R. Cachola, and M. C. Nunes.
Bol Inf Inst Biol Marit. 13, p1-9, 1974.

Descriptors: *Bacteria, *Coliforms, *Shellfish, Europe, Coasts, Clams, Mollusks, Oysters, Water pollution effects.
Identifiers: Cockles, *Portugal(Algarve).

Statistics on the coliform content in shellfish and in seawater in several southern coastal regions of Portugal (Algarve) from 1963-1972 are reported. Oysters, clams and cockles were studied. The pluviometric conditions of this region may have caused irregularities in the results. Typical coliform values were under 50 MPN (most probable number)/g of meat. In Faro and Tavira values were somewhat higher. At Fuzeta there is weak bacterial pollution.--Copyright 1975, Biological Abstracts, Inc.

SEVERAL FACTS ABOUT THE CHANGES IN THE QUANTITY OF THE PHYTOPLANKTON OF THE DANUBE, (IN CZECH),
Slovenske Narodne Muzeum, Bratislava (Czechoslovakia).
S. Juris.
Zb Slov Nar Muz Prir Vedy. 19(2), p103-111, 1973.

Descriptors: *Phytoplankton, *Diatoms, Rivers, Algae, *Chlorophyta.
Identifiers: *Cryptomonas-Sp, *Czechoslovakia, *Danube River.

In May, June and July of 1967, water samples were taken between 1819 and 1819.5 km of the Danube, near the port of Gabcikova (Czechoslovakia). Despite the mixing effect of the 2 m/s current, the vertical distribution of phytoplankton is not even. Samples taken at a depth of 10 cm on the left bank, 1 km below the tributary Bakanske romeno, showed the highest concentration. Those from the right bank, taken 8 km below the nearest tributary, were only 36% of those from the other side. At the center of the stream, density was only 17% of that determined on the left bank. The density at a depth of 10 cm varied between 10,000 and 21,250 cells/ml on 1 day. The organisms were 14 diatoms, 17 green algae and 1 Cryptomonas sp.--Copyright 1975, Biological Abstracts, Inc.

A STUDY OF THE ZOOPLANKTON FROM THE DANUBE MOUTH AND FROM THE PREDELTA AREA DURING 1970 (IN GERMAN),
Academia R. S. R., Bucharest (Rumania). Institutul de Biologie.
V. Popescu-Marinescu.
Arch Hydrobiol Supplementb. 44(3), p 372-382, 1974.

Descriptors: *Zooplankton, Biomass, Deltas, Production, Rivers.
Identifiers: *Danube River, *Romania.

The quantitative and qualitative aspects of zooplankton from the mouth regions of the Danube branches (Sulina and Sf. Gheorghe) and from the predeltaic area northern Sulina Bay, southern Sulina Bay, and Sakhalin Bay (Romania) are discussed. The zooplankton of the Danube branches is characterized by predominance of the freshwater species and that of the predeltaic area by a mixture of limnic, brackish-water and marine species. In 1970, the seasonal variation of zooplankton in both regions was accentuated, on the main reasons being the exceptionally high flood. The zooplankton of both Danube branches and of the predeltaic area is rich in number of species but produces little biomass.--Copyright 1975, Biological Abstracts, Inc.

CONTENT OF HETEROTROPHIC MICROORGANISMS IN WATER OF LAKE BAIKAL, (IN RUSSIAN),
Biologo-Geograficheskii Nauchno-Issledovatelskii Institut, Irkutsk (USSR).
E. A. Maksimova, V. N. Maksimov, and E. I. Vorob'eva.
Mikrobiologiya. 43(1), p124-128, 1974.

Descriptors: *Eutrophication, Lakes, Microorganisms, Bacteria, Water pollution effects.
Identifiers: Baikal, *Heterotrophic microorganisms, USSR, *Lake Baikal.

The number of heterotrophic microorganisms in a water layer from the surface to 100 m was studied at 24 pelagic stations of Lake Baikal. The southern and middle Baikal to Selenghin shoal contained heterotrophic microorganisms in an amount typical for oligotrophic lakes (1-5 cells/ml); the content of heterotrophs was 440 cells/ml in the surface water layer only near the town Baikalsk (USSR). Upper water layers contained 51 cells/ml in the regions near the river Turka and the Barghuzin bay. Eutrophied waters of the Small Sea influenced to a considerable degree the number of the heterotropic microorganisms at station 8, two km to the south of the Olkhon Gates (over 100 cells/ml in the surface layer). The number of heterotrophic microorganisms in the northern part of Lake Baikal did not exceed 20 cells/ml and was maximal for the lake in the course of the investigation. The heterotrophic bacteria are very important for self-purification of water of Lake Baikal.--Copyright 1975, Biological Abstracts, Inc.

DECOMPOSITION OF NITROGENOUS ORGANIC SUBSTANCES IN SURFACE WATERS, (IN RUSSIAN),
Hygieny a Epidemiologie, Prague (Czechoslovakia). Institut.
E. Vokounova.
Gig Sanit. 2, p 85-87, 1974.

Descriptors: *Decomposing organic matter, *Protein, *Nitrogen, *Chromatography, Surface waters, Pollutant identification.
Identifiers: Paper chromatography, Amines.

Laboratory experiments were carried out with reservoir water to which a model protein substance was added 1st and then various natural materials. At a dose of protein N equal to 12-14 mg/l 90% degradation occurred within 30 days, the

greater part within the 1st wk. At 1st ammonia formed and then it oxidized to nitrites and then to nitrates. During decomposition a number of free amino acids formed, mainly during the formation of ammonia. In addition to temperature, the breakdown of protein substances was affected also by the chemical composition of the water, mainly by the content of dissolved phosphates. Several primary and secondary amines were also differentiated and identified by paper chromatography.--Copyright 1975, Biological Abstracts, Inc.

CONTRIBUTION TO THE KNOWLEDGE OF THE DISTRIBUTION, BIOMASS AND DRIFT OF THE ZOOPLANKTON IN THE CZECHOSLOVAK-HUNGARIAN STRETCH OF THE DANUBE, (IN GERMAN),
Slovenska Akademie Vied, Bratislava (Czechoslovakia). Lab. of Fisheries Hydrobiology.
M. Vranovsky.
Arch Hydrobiol Supplementb. 44(3), p 360-363, 1974.

Descriptors: *Biomass, *Zooplankton, Distribution patterns, *Littoral drift.
Identifiers: Czechoslovak, *Danube River, Hungary.

In a cross section of the Danube River (km 1820) an irregular horizontal distribution of zooplankton was found. The maximum values of the zooplankton biomass occurred in autumn and ranged between 300-600 mg/m3 fresh weight in 1966 and 1967. The average amount of the zooplankton drifing through the investigated section reached 136 g/s in 1966 and 260 g/s in 1967.--Copyright 1975, Biological Abstracts, Inc.
W76-07306

ZOOPLANKTON OF SMALL LAKES OF THE EASTERN PART OF THE BOLSHEZEMELSKAYA TUNDRA, (IN RUSSIAN),
N. V. Vekhov.
Biol Nauki. 17(2), p 7-13, 1974.

Descriptors: Zooplankton, Copepods, Crustaceans, Lakes, Rotifers, Tundras, Ponds, Biomass, Vegetation.
Identifiers: Bolshezemelskaya, Russian-SFSR, USSR.

Data are presented on the zooplankton of 5 small lakes and ponds located 25 km from Vorkuta in the Bolshezemelskaya tundra in the Archangel Oblast and Komi ASSR (Russ SFSR, USSR). The zooplankton of the ponds and lakes consisted of 42 spp. and subspecies of rotifers, 15 spp. and subspecies of cladocerans and 8 spp. of copepods. Some crustaceans and rotifers were found only in ponds. Most diverse was the zooplankton (35 spp.) in the overgrown zone of the lakes. In areas with open water the plankton was considerably scantier and represented mainly by crustaceans. The seasonal dynamics of the abundance and biomass of the plankton was different in different lakes. Two groups of lakes were distinguished. In one the zone of shore vegetation was well defined and the plankton was diverse, mainly owing to forms of caldocerans and rotifers living in the overgrowth; in the other overgrowths of higher aquatic plants were absent, plankton was weakly developed, its species composition was scanty and peaks of the abundance and biomass of the plankton were not apparent.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF MEASURES REDUCING EUTROPHICATION ON THE PHYTOPLANKTON OF THE REITHER SEA IN TYROL (AUSTRIA), (IN GERMAN),
I. Findenegg.
Ber Naturwiss-Med Ver Innsb. 60, p 7-14, 1973.

Descriptors: *Eutrophication, Phytoplankton, Europe, Water pollution control, Nutrients, Seasonal, Measurement, Biomass, Algae, Lakes.
Identifiers: Austria, *Reither Sea, Tyrol.

Measures were taken to control eutrophication of the Reither Sea (area 1.5 ha, 8 m deep) by accelerating nutrient outgo. Since 1972 water of the hypolimnion rich in nutrients is drawn off by a siphon. In May, the lake was sprinkled with ferric chloride. Routine identification and counting of the phytoplankton was carried out in 1971 and 1972 in order to evaluate the efficacy of the nutrient dilution and the chemical treatment. In spring and autumn of 1972 the algal biomass proved to be somewhat lower than in the same seasons of 1971. In summer it was almost twice as high. No direct result of the chemical flocculation of the phytoplankton was observed. It is assumed that the nutrient dilution was effective in lowering the algal biomass but that this effect was overcompensated by pollutants brought into the lake during the summer in connection with the tourist industry.--Copyright 1975, Biological Abstracts, Inc.

RESTORATION OF A EUTROPHICATED LAKE (REITHER SEA, TYROL, AUSTRIA), (IN GERMAN),
Innsbruck Univ. (Austria). Inst. of Zoology.
R. Pechlaner, and N. Schultz.
Ber Naturwiss-Med Ver Innsb. 60, p 183-201, 1973.

Descriptors: *Lakes, Eutrophication, Europe, Nutrients, Recreation, Secchi disk, Oxygen, Phosphorus, Temperature.
Identifiers: *Austria, *Reither Sea, Tyrol, *Lake restoration.

Nutrient inflow to the Reither Sea from point sources was stopped in 1961, but the recreational value of this small, highly eutrophic lake continued to decrease. The following methods of lake restoration were applied in 1972: Hypolimnetic water was drawn from the lake by means of an 'Olszewski-tube.' Surface water was treated with ferric chloride to precipitate dissolved and suspended material, thus cleaning the epilimnion and intensifying the elimination of plant nutrients via the Olszewski-tube. Water renewal was accelerated by piping surplus drinking water to the lake. The effects of these measures on temperature, O2 and P concentrations and Secchi disk transparency are described. The response of phytoplankton is discussed by Findenegg.--Copyright 1975, Biological Abstracts, Inc.

HYDROBIOLOGICAL OBSERVATIONS ON THE RIVER RIUL DOAMNEI (DISTRICT ARGES), (IN ROMANIAN),
Institutul de Cercetari si Proiectari Aliment., Bucharest (Rumania).
M. Gheorghe.
Bull Cercet Piscic. 31(3/4), p 25-34, 1972.

Descriptors: Rivers, Europe, Ecology, Salmonids, Diatoms, Fish, Trout, Chub, Mackerel, Bullhead, Larvae, Productivity.
Identifiers: Barbus-Meridionalis-Petenyi, Chironomidae, Chondrostoma-Nasus, Cottus-Gobio, Doamnei, Ephemeroptera, Leuciscus-Cephalus, Man, Nemachilus-Barbatulus, Phoxinus-Phoxinus, Plecoptera, Riul, *Romania, Romanichthys-Valsanicola, Salmo-Trutta-M-Fario, Trichoptera.

The Riul Doamnei River (in Romania) not thoroughly studied ecologically till now, presented a 'troubled' balance as a consequence of the recent and heavy intervention of man. The river's water has been directed towards Lake Vidraru. The river's faunistic and floristic association, includes numerous elements present in the food of salmonids: Diatomea and Ephemeroptera, Plecoptera, Trichoptera, Chironomidae larvae. The vertebrates were represented mainly by fishes. The Riul Doamnei River's fauna includes 18 fish species belonging to 6 families, the Cyprinids forming 55%. The most numerous fish species are: the river trout (Salmo trutta m. fario) the chub (Leuciscus cephalus), the minnow (Phoxinus phoxinus), the mackerel (Chondrostoma nasus), the spotted barbel (Barbus meridionalis petenyi), the stone loach (Neomachilus (Orthrias) barbatulus) and the bullhead (Cottus gobio); Romanichthys valsanicola mentioned previously, was not found again. In relation to the hydrographic characters, and the quality and quantity of water flora and fauna, the water courses of the Riul Doamnei basin present a moderate biogenic capacity. The trout zone, poorly populated with fishes, has a low natural productivity. In the period 1969-1972 the Riul Doamnei River, was a depopulated ecosystem, unmanaged for fish culture.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF SOME METALS ON PRIMARY PRODUCTION IN THE COASTAL WATER OF THE CASPIAN SEA, (IN RUSSIAN),
All-Union Research Inst. of Marine Fisheries and Oceanography, Moscow (USSR).
S. A. Patin, V. N. Tkachenko, A. M. Ibragim, and L. V. Fedotova.
Okeanologiya. 14(1), p 91-94, 1974.

Descriptors: Primary productivity, Metals, Water pollution effects, Coasts, Cadmium, Cobalt, Copper, Mercury, Lakes, Toxicity, Zinc.
Identifiers: Aphanizomenon-flos-aquae, Carbon-14, *Caspian Sea, Exuviaella-cordata, Thalassiosira-gaspica, USSR.

The studies with the radiocarbon method revealed the influence of additions of Hg, Cd, Cu, Co and Zn salts on the rate of photosynthetic assimilation in coastal sea water samples (Aphanizomenon flosaquae, Exuviaella cordata, Thalassiosira caspica dominants) of the West Caspian Sea (USSR). The experiments were performed at a temperature and illumination close to the photosynthetic conditions in the surface layer of the sea. Inhibition is shown at comparatively low

concentrations (1-10 microgram/L) of Hg, Cu and Cd; Hg had the greatest toxicity. The introduction to the samples of 1 to 100 microgram/L Co and K2PO4 had no effect.--Copyright 1975, Biological Abstracts, Inc.
W76-07313

DISTRIBUTION, PHYTOCENOLOGY AND PRODUCTIVITY OF NYMPHAEACEAE IN RESERVOIRS OF THE DNIEPER CASCADE, (IN UKRANIAN),
Akademiya Nauk URSR, Kiev (USSR). Central Republican Botanical Garden.
D. V. Dubyna.
Ukr Bot Zh. 30(6), p 694-701, 1973.

Descriptors: *Distribution, *Productivity, Reservoirs, Water level fluctuation.
Identifiers: Drugs, Fodder, Nuphar-luteum, Nymphaea-alba, Nymphaea-candida, *Nymphaeaceae, *Phytocenology, *USSR(Dnieper Cascade).

In 1968-1972 distribution and reserves of Nymphaeceae (Nymphaea alba, N. candida, Nuphar luteum) were studied in the Kiev, Kremenchuk and Kakhovka reservoirs being in the Polesye, Forest-Steppe and Steppe zones, respectively (USSR). For comparison their reserves in the natural basins are studied. Nymphaeaceae cover 5-7% of shallow areas in the Kiev, 1-2% in Kremenchuk and 0.5% Kakhovka reservoirs. The maximum yield of green mass and rhizomes is observed in the natural basins and reservoirs in Polesye, the minimum one in the Steppe zone. Sharp fluctuations of water level affect negatively the growth and development of Nymphaeaceae; the hydrological conditions are most stable in the Kiev reservoir. A problem is put concerning the protection of Nymphaeaceae and enrichment of their reserves as they are of a considerable value as drug, food, fodder and ornamental plants.--Copyright 1975, Biological Abstracts, Inc.
W76-07314

DENSITY AND BIOMASS OF PHYTOPLANKTON POPULATIONS IN AN APENNINE LAKE (LAKE SANTO PARMENSE) DURING THE WINTER FREEZE, (IN ITALIAN),
Parma Univ. (Italy). Laboratorio di Ecologia.
I. Ferrari, and L. Camurri.
Ist Lombardo Accad Sci Lett Rend Sci Biol Med B. 107(1), p 33-42, 1973.

Descriptors: *Biomass, *Phytoplankton, Freezes, Lakes, Photosynthesis, Algae, Chlorophyll, Europe, Density, Nutrients, Zooplankton.
Identifiers: Apennine, Italy, Santo-parmense.

Water samples for analysis of phytoplankton and photosynthetic pigments were collected in Largo Santo Parmense (1507 m; North Apennine, Italy) during the winter cover from Jan. to Apr., 1973. The samples were always collected at 7 different depths from a station corresponding to the maximum depth of the lake (22.5 m). The algae in the samples were counted. Fresh weight of phytoplankton and concentration of chlorophyll a were determined. There is a good correlation between these 2 parameters. There is an evident trend towards a decrease in both density and biomass of the phytoplankton from Jan. to Apr. In the earlier series of samples, the highest values of biomass are observed at -5 m and -10 m depths. The succession of phytoplankton density and biomass during winter cover is correlated with the dynamics of other parameters, such as the thickness of ice cover, the concentration of algal nutrients and of O2, the density of grazing zooplankters.--Copyright 1975, Biological Abstracts, Inc.
W76-07316

THE EFFECTS OF THREE ANTI-PETROLEUM AGENTS ON THE PRIMARY PRODUCTIVITY OF AN EXPERIMENTAL COMMUNITY OF BENTHIC DIATOMS, (IN FRENCH),
Museum National d'Histoire Naturelle, Paris (France). Laboratoire de Physiologie Generale et Comparee; and Institut Oceanographie.
J.-C. Lacaze.
Vie Milieu Ser B Oceanogr. 23(1), p 51-67, 1972.

Descriptors: *Primary productivity, *Diatoms, Benthos, Systematics, Oil pollution, *Emulsifiers.
Identifiers: Carbon-14, Corexit, Gamosol, Sefoil, Substrates.

The effects of 3 anti-oil emulsifying agents on the taxonomic composition and the primary productivity of an experimental community of benthic diatoms were studied. This association of microalgae develops on artificial polished glass supports immersed in a 3000-l brackish ecosystem in the laboratory. The community's photosynthetic activity was measured by carbon 14 and pH-carbonic gas. The exposure periods varied (1, 15, 30 min and 3 and 10 h) for the concentration of 40 mg 1/l of each of the 3 anti-oil substances. The effects of the pollution were studied immediately after exposure to the substances (short-term effects), then after 5, 10 and 30 days (long-term effects). Two of the anti-oil substances (Sefoil and Corexit) do not change primary production and therefore, in this aspect, show no toxicity under test conditions. Gamosol, a substance used massively when the oil tanker 'Torrey Canyon' was shipwrecked (18th March, 1967), is distinctly toxic. Only long-term tests make it possible to show the real effect of a polluting substance. Thus, a 30-min Gamosol exposure, which at first induces only a slight decrease of primary production, after 5 days is fatal. Microscopic observation shows that the algae forming the community are destroyed through this exposure. A new community, made up of small diatom species, then develops rapidly, so that after 30 days, primary production of the communities having undergone pollution is twice that of the control communities.--Copyright 1975, Biological Abstracts, Inc.

STUDIES ON THE BIOLOGY OF DREISSENA POLYMORPHA PALLAS IN LAKE CONSTANCE, (IN GERMAN),
Freiburg Univ. (West Germany). Limbologisches Institut.
N. Walz.
Arch Hydrobiol Supplementb. 42(3/4), p 452-482, 1973.

Descriptors: *Lakes, Europe, *Mussels, Water supply, Distribution, Water pollution effects, Water pollution control.
Identifiers: Dreissena-Polymorpha, *Germany(Lake Constance).

The immigration of Dreissena, a freshwater mussel, into Lake Constance and the subsequent increase in numbers was a potential danger to the water supply. Accordingly the distribution of the free-swimming veliger larvae was investigated in 2 parts of the lake. Numbers settling varied greatly according to the nature of the substratum presented. The largest specimens occurred in the shallow water; there was a steady fall in average size down to 30 m and in deeper water size remained steady. A method of controlling the mussels in pipes by means of atmospheric N was developed.--Copyright 1975, Biological Abstracts, Inc.

WHAT SHOULD BE DONE WITH HAUGATJERN, (IN NORWEGIAN),
Tromsoe Museum (Norway). Dept. of Zoology.
O. J. Jacobsen, and V. Ausen.
Fauna (Oslo). 27(3), p 160-165, 1974.

Descriptors: *Eutrophication, Lakes, Europe, *Trout, Fish reproduction, *Oxygen requirements, Fish food organisms.
Identifiers: Eutrophication, *Norway(Haugatjern), *Whitefish.

Haugatjern a small euthrophic lake situated east of Roros in the county of Sor-Trondelag (Norway), is widely known for its high whitefish production, about 400 kg/ha/yr in its best period. Late recruitment to the whitefish stock has been insufficient due to an O2 deficit in the lake in winter. Practical methods to increase the stock might include transferring water from a nearby river and attempts to stop further eutrophication. To obtain maximum benefit of the fish food organisms in the lake it would probably be profitable to release trout in addition to the whitefish.--Copyright 1975, Biological Abstracts, Inc.

MICROFLORA OF DIFFERENT TYPES OF MINERAL WATERS OF SOUTHEASTERN REGION OF WEST SIBERIA, (IN RUSSIAN),
Nauchno-Issledovatelskii Institut Kurortologii i Fizioterapii, Tomsk (USSR).
T. M. Tronova.
Mikrobiologiya. 43(1), p 129-132, 1974.

Descriptors: Aquatic plants, *Bacteria, Microbiology, Microorganisms, Water pollution effects, Asia.
Identifiers: *Mineral waters, *Mycobacteria, *USSR(West Siberia).

Microbiological studies of mineral waters of different types from the southeast of west Siberia (USSR) carried out in 1968-1972 have shown that these mineral waters contain various microflora participating in the turnover of N, C, S and Fe. The total number of microorganisms varies from hundreds of thousands to several millions of cells

per ml of water. Mycobacteria, denitrifying, sulfate reducing, hydrocarbon oxidizing and methane forming bacteria predominate in these waters. Each water type has a typical composition of physiological groups of bacteria.--Copyright 1975, Biological Abstracts, Inc.

THE TRICHOPTERA OF THE SUNDAYS AND FISH RIVERS, EASTERN CAPE PROVINCE, SOUTH AFRICA,
Albany Museum, Grahamstown (South Africa).
K. M. F. Scott.
Ann Cape Prov Mus Nat Hist. 9(13), p 223-235, 1974.

Descriptors: Africa, Rivers, Aquatic animals, *Water quality, Water level fluctuations, Fish, Farm management.
Identifiers: Anabolia-Sp, Cape, *Cheumatophsyche-Afra, Ecnomus-Forbesi, Ecnomus-Thomasseti, Hydroptila-Capensis, Hydroptila-Cruciata, Limnephilus-Sp, Simulium-Sp, *Trichoptera, *South Africa(South River Sunday River).

The impoverishment of the Trichoptera fauna is intensified by the poor quality of the water, arid climate, geology of the area, farming methods and alternations between drought and flood. The abrasive action of sand and silt and fluctuations in water levels were important factors in the reduction of stream populations. Different species of Cheumatopsyche occur in Sundays and Fish Rivers in spite of the many similarities between them. The species found were: Cheumatopsyche afra (Mosely), Ecnomus thomasseti Mosely, E. forbesi Scott, Hydroptila sp., H. capensis Barnard and H. cruciata Ulmer, Simulium sp., Limnephilus sp., Anabolia sp.--Copyright 1975, Biological Abstracts, Inc.

STOMACH CANCER AND ECOLOGIC FACTORS IN JAPAN,
Tohoku Univ., Sendai (Japan). Dept. of Hygiene.
E. Takahashi.
Tohoku J Exp Med. 113(2), p 129-133, 1974.

Descriptors: *Human diseases, Diseases, *Ecology, Mineralogy, Rivers, *Mortality, *Water quality, Calcium, Sulfates, Chlorides, Vitamins, Water pollution effects.
Identifiers: *Cancer, Carcinogenesis, *Ecologic factors, *Japan, *Minerals, Stomach cancer, *Sunshine.

The correlation between mortality rate from stomach cancer and some basic ecological factors such as average temperature, sunshine duration and mineral content of river water was studied on 46 prefectures in Japan. Peculiar geographic distribution of the death rate from stomach cancer in Japan is as introduced by Segi and others. The river water quality is expressed as the ratio of Ca/SO4. The negative correlation coefficients of the male age-adjusted stomach cancer mortality rate with yearly sunshine duration and the Ca/SO4 ratio of river water were significant, but no correlation was found with yearly average temperature. The meaning of the significant correlation is interpreted as follows. Sulfate and chloride seemed to be etiological agents of inflammation which sometimes develop into ulcers, polyps and cancer in the stomach mucous membrane. Ca has an antiphlogistic effect, because of its capillary permeability reducing action, which may also prevent lodging of tumor cells in hematogenous metastases of cancer in the microcirculation system. Sunshine duration may be concerned with Ca absorption through its action of vitamin D production in skin.--Copyright 1974, Biological Abstracts, Inc.

HYGIENIC CHEMICAL STUDIES ON WATER QUALITY OF THE MOAT OF IMPERIAL PALACE: I. RELATIONSHIP BETWEEN SEASONAL WATER QUALITY AND MICROFLORA IN THE MOAT. (IN JAPANESE),
National Inst. of Hygienic Sciences, Tokyo (Japan).
Y. Sayato, S. Matsui, K. Nakamuro, M. Ando, and M. Tonomura.
J Hyg Chem. 19(2), p 94-101, 1973.

Descriptors: *Water quality, *Seasonal, *Eutrophication, Plankton, Oxygen, Alkalinity, *Chemical analysis.
Identifiers: Imperial palace, *Japan, *Moats.

Seasonal changes in the quality of water and in plankton was investigated in the moat around the Imperial Palace (Japan). At present the moat is not polluted by industrial or domestic waste water. The sampling stations were placed at 8 points in the moat and the following results were obtained: changes in the quality of water and in plankton showed a seasonal characteristic pattern; the water of the moat is eutrophic because of the alkalinity and excessive saturation of dissolved O2 in the water and formation of the so-called aquatic bloom, the growth and decay of plankton in the moat are related to biochemical O2 demand, dissolved O2, dissolved silicate, and sulfide. (See also W76-07427) Copyright 1975, Biological Abstracts, Inc.
W76-07426

HYGIENIC CHEMICAL STUDIES ON WATER QUALITY OF THE MOAT OF IMPERIAL PALACE: II. RELATIONSHIP BETWEEN WATER QUALITY AND HORIZONTAL INSOLATION INTENSITY, (IN JAPANESE),
National Inst. of Hygienic Sciences, Tokyo (Japan).
Y. Sayato, S. Matsui, K. Nakamuro, M. Ando, and M. Tonomura.
J Hyg Chem. 19(2), p 102-105, 1973.

Descriptors: *Asia, Eutrophication, *Water quality, Water pollution, Oxygen, *Chemical analysis.
Identifiers: Horizontal insolation intensity, Imperial palace, Insolation intensity, *Japan, *Moats, Hibiya Bori.

The yearly and daily changes in the quality of water in the moat around the Imperial Palace (Japan) were examined to find a relationship, if any, between water quality and horizontal insolation intensity (HII). The sampling station for the daily survey was placed at the moat of Hibiya Bori, and the following results were obtained: quality of the water in the moat is eutrophic, and yearly progressive pollution was not recognized; the HII is related to dissolved O2 in the Hibiya Bori in summer. A TEST OF THE HYPOTHESIS THAT ABIOTIC PHOSPHATE COMPLEXING INFLUENCES PHOSPHORUS KINETICS IN EPILIMNETIC LAKE WATER,
Canada Centre for Inland Waters, Burlington (Ontario).
D. R. S. Lean, and F. H. Rigler.
Limnol Oceanogr. 19(5), p 784-788, 1974.

Descriptors: *Lakes, *Eutrophication, *Analytical techniques, Model studies, *Kinetics, *Phosphorus, Epilimnion, Filters, Membranes.
Identifiers: Epilimnetic, Phosphorus-32.

The uptake kinetics of 32P-PO4 added to water from a eutrophic lake are frequently biphasic; consequently the system cannot be described by a 2-compartment exchange model. Experiments in which uptake kinetics and the effectiveness with which hydrous zirconium oxide removes 32P-PO4 from filtered lake water were measured concurrently showed that the biphasic kinetics cannot be explained by postulating an abiotic complexing of 32P-PO4 with some other component of membrane filtered lake water.--Copyright 1975, Biological Abstracts, Inc.

TURNOVER AND UPTAKE OF DISSOLVED PHOSPHATE IN FRESHWATER: A STUDY IN LAKE KINNERET,
Weizmann Inst. of Science, Rehovoth (Israel). Dept. of Isotope Research.
M. Halmann, and M. Stiller.
Limnol Oceanogr. 19(5), p 774-783, 1974.

Descriptors: *Lakes, *Pollutants, *Phosphates, *Analysis, *Freshwater, Nutrients, Surface waters, Eutrophication.
Identifiers: *Israel(Kinneret Lake).

The residence times and turnover rates of dissolved phosphate in the surface water of Lake Kinneret and in the Jordan River (Israel) above and below the lake were measured by adding 32P-HPO42- tracer to the unfiltered water and determining its disappearance from solution. Residence times varied from 9.1-0.2 h in winter and summer at water temperatures of 14.5-30 C: the turnover rates (V) ranged from 0.02-0.20 micro M h-1. The rate of uptake by plankton (V4) of dissolved phosphate could be fitted to a Monod equation, $Vi = VmS/(Ks + S)$, in which Vm and Ks are the maximal rate and the half-saturation constant. Values of Vm were in the range of 0.04-1.1 micro M h-1 for winter and summer; Ks values ranged from 0.2-0.8 micro M, higher than the usual observed natural concentration of dissolved phosphate in Lake Kinneret. In Lake Kinneret, phosphate is apparently the primary limiting nutrient. In the Jordan River, upstream of Lake Kinneret, the dissolved phosphate concentration (0.44 micro M) was higher than the Ks value (0.27 micro M) and therefore here phosphate may not be the primary limiting nutrient.--Copyright 1975, Biological Abstracts, Inc.

EXPERIMENTAL CHARACTERIZATION OF LACUSTRINE CHLOROPHYLL DIAGENESIS: II. BACTERIAL, VIRAL AND HERBIVORE GRAZING EFFECTS,
North Carolina State Univ., Raleigh. Dept. of Zoology.
R. J. Daley.
Arch Hydrobiol. 72(4), p409-439, 1973.

Descriptors: *Bacteria, *Crustaceans, *Algae, *Chlorophyll, *Effects, *Analytical techniques, *Chromatography, Lakes, Limnology, Herbiuores, Pollutant identification.

Identifiers: Cytophaga-Phycophthora, Daphnia-Pulex, OchromonasoSp.

The effects of a bacterium, a cyanophage, a crustacean and a phagotrophic flagellate on chlorophyll destruction and chlorophyll derivative formation in several algae were studied using thin-layer chromatography and scanning chromatogram fluorometry. Chlorophyll could not be catabolized directly by the bacterium, Cytophaga phycophthora, but was rapidly destroyed by photooxidation following cell lysis induced by both the bacterium and the LPP-I virus. Pheophytins and allomerized phorbins were formed concurrent with destruction in the presence of oxygen and acids, repectively. Ingestion of algae by both herbivores, Daphnia pulex and Ochromonas sp., resulted in the destruction of chlorophyll and the formation of pheophytins and pheophorbides. The a and b phorbins, organic C and organic N were all destroyed at the same relative rates by D.pulex. Post-lytic photochemical oxidation and herbivore predation are the principal mechanisms of chlorophyll diagenesis in situ. The paleolimnological implications of the results are discussed and the use of the sedimentary pheophorbides as a measure of herbivore grazing pressure through postglacial time is suggested.--Copyright 1975, Biological Abstracts, Inc.

5D. Waste Treatment Processes

OVERLAND FLOW TREATMENT OF SWINE MANURE LAGOON EFFLUENT,
Oregon State Univ., Corvallis. Water Resources Research Inst.
J. O. Boda, and T. L. Willrich.
Completion Report WRRI-40, February 1976. 149 p, 17 fig, 45 tab, 36 ref. OWRT A-017-ORE(1).

Descriptors: *Overland flow, *Waste water treatment, *Hogs, Pollution abatement, *Farm wastes, *Farm lagoons, Anaerobic conditions, Waste treatment, Water quality control.
Identifiers: Swine manure, *Anaerobic lagoons.

Effluent from an anaerobic swine manure lagoon was applied at the upper end of six, 100 feet (30.5 m) long by 3 feet (0.9 m) wide, grass covered plots which sloped about 3 percent. Objectives of this study were to measure concentration attenuation and mass reduction of potential pollutants in the wastewater as the result of overland flow, and to examine the influences of experimental variables on the effectiveness of the overland flow wastewater treatment process. Controlled variables included application rate and grass species. Seasonal differences in temperature, precipitation, and related physical, chemical and biological conditions were uncontrolled variables. Wastewater and soil horizons were sampled and analyzed at selected plot intervals, and plot runoff volume, air temperature, precipitation, and water table data were recorded. Amounts of wastewater applied to the experimental plots ranged from 2.0 to 10.8 inches (5.1 to 27.4 cm) per week. Grass cover on three plots was Alta fescue. The other three plots were seeded with redtop.

POULTRY PROCESSING PLANT WASTEWATER DISPOSAL ON SOD,
Maryland Univ., College Park. Dept. of Agronomy.
G. L. Miller, and J. H. Axley.
Maryland Water Resources Research Center, College Park, Technical Report 36, (1975). 80 p, 14 fig, 31 tab, 69 ref. OWRT A-013-MD (1) 14-31-0001-5020.

Descriptors: Poultry, *Waste water disposal, *Waste assimilative capacity, Nutrient removal, Infiltration, Filtration, *Water reuse, Grasses, Bluegrasses, Forage grasses, *Fescues, Soils, Loam, Drainage.
Identifiers: *Sod assimilation waste water, *Poultry processing wastes.

The rectification of poultry processing wastewater was investigated by utilizing soil and forage as a renovating and filtering system. Kentucky bluegrass (Poa pratensis L.), Penncross bentgrass (Agrostis palustris Huds var. Penncross), ladino clover (Trifolium repens L.), red top (Agrostis alba L.), tall fescue (Festuca arundinacea Schreb.), smooth bromegrass (Bromus inermis Leyss), reed canarygrass (Phalaris arundinacea L.), and Rough bluegrass (Poa trivialis L.) were employed. Soil covered with a dense sod of Kentucky bluegrass supported an infiltration rate that was 2.4 times more than tall fescue. Tall fescue yielded the best and removed the most N, P, K, Mg and Ca from the system. Cylindrical monoliths 7.6 X 152 cm of a Sassafras sandy loam were used to show that continuous flooding with poultry processing wastewater greatly decreased internal drainage. Soils receiving intermittent irrigating renovated more wastewater than flooded soils. In this soil iron reducing and sulfur forming microorganisms may be the reason for a great reduction in internal drainage when soils are continuously flooded with poultry processing wastewater or sugar water.

CHEMICAL KINETICS OF NEUTRALIZATION OF ACIDIC WATER BY CRUSHED LIMESTONE,
Pennsylvania State Univ., University Park Inst. for Research on Land and Water Resources.
F. H. Pearson, and A. J. McDonnell.
In: Water Resoruces Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 85-98. 5 fig, 8 ref.

Descriptors: *Neutralization, *Limestones, *Acid mine water, *Chemistry, Chemical reactions., Environmental engineering.
Identifiers: *Chemical kinetics.

Crushed limestone is usually the cheapest reagent for the neutralization of acid wastes. To provide for the rational design of limestone neutralization processes, the kinetics of the chemical reactions involved were evaluated by experiment, and an analysis was made of the chemical and physical boundary conditions that control the extent to which the reactions are completed. The rate limiting reactions are the attack of limestone by hydrogen ions, and the exsolution of carbon dioxide which is thereby generated; the latter reaction has an increasing effect on process efficiency above pH 5. Rate constants for the limiting reactions were evaluated each as a function of temperature, ionic strength, water turbulence, and for the first reaction bicarbonate ion concentration, which catalyzes the attack of limestone by hydrogen ions. A mathematical model of limestone neutralization processes reproduced experimental data. (See also W76-06938) (Sims - ISWS)
W76-06946

APPLICATION OF A 500 KEV ELECTRON ACCELERATOR TO THE CONTINUOUS IRRADIATION OF LIQUIDS, ESPECIALLY WASTE WATERS (ANWENDUNG EINES 500-KEV-ELEKTRONENBESCHLEUNIGERS ZUR KONTINUIERLICHEN BESTRAHLUNG VON FLUESSIGKEITEN, INSBESONDERE ABWAESSERN),
Technische Hochschule, Vienna (Austria). Institut fuer Allgemeine Chemie.
R. Wiesboeck, and E. Proksch.
Kerntechnik, Vol. 18, No. 1, p 20-28, 1976. 8 fig, 4 tab, 23 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Irradiation, Gamma rays, Disinfection.
Identifiers: Electron accelerator.

Ionizing radiation has been used to decompose various classes of substances in industrial waste waters including phenols, dyestuffs, pesticides, PCBs, detergents, and cyanides. However, economic applications of gamma radiation have not appeared feasible because the sources of gamma radiation for the treatment of large flow rates are too expensive. The construction and operation of an experimental plant for the irradiation of large liquid volumes at high efficiency using low electron energies are described. The liquid to be treated is passed over an irradiation plate normal to the scanner deflection through the electron beam. The electron accelerator voltage is 500 kV, and the electron current can be controlled over the range 0 to 25 mA. A homogenous irradiation of water in layer thicknesses much greater than the average depth of penetration of the electrons was observed. An explanation of this phenomenon is the indirect radiation effect of an approximately uniform mechanical mixing of the liquid during the irradiation achieved in the present irradiation equipment by turbulent flow. This experimental setup was used to treat dyeworks effluents and cyanide containing water. Capital and operating costs for an hypothetical 40 cu m irradiation plant were estimated to be less than or comparable to treatment with activated carbon. Irradiation with low energy level electrons appears to be a technologically and economically viable treatment method for colored waste waters. (Orr-FIRL)
W76-06957

REMOVAL OF HALO-HYDROCARBONS FROM WATER.
French Patent FR 2261-986. Issued October 24, 1975. Derwent French Patents Abstracts, Vol. W, No. 50, p F2, January 20, 1976.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Patents, Organic compounds, Evaporation, Oil wastes.
Identifiers: Halo-hydrocarbons.

A method for the removal of halo-hydrocarbons from waste water from textile finishing operations has been patented. The halo-hydrocarbons, such as perchloroethylene, are removed by evaporation as azeotropes into a stream of air. The effluent is kept in a residence zone in which the gas phase in contact with the water is repeatedly renewed. This method provides a simple way of obtaining a non-toxic effluent suitable for discharge to the sewer system. The water may be mechanically mixed by a stirrer while in the residence zone or the gas phase may be injected into the water to increase the contact surface. Heating the water will reduce the time necessary for effecting purification. (Orr-FIRL)
W76-06958

THE CONTROL OF ENVIRONMENTAL PROBLEMS IN THE SWISS TEXTILE REFINING INDUSTRY (DIE BEWAELTIGUNG VON UMWELTPROBLEMEN IN DER SCHWEIT-

ZERISCHEN TEXTILEVEREDELUNGSINDUSTRIE),
W. Schefer.
Forum Umwelthygiene, Vol. 2, No. 2, p 46-49, February, 1976. 2 fig, 1 tab, 16 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Toxicity, Analytical techniques, Environmental effects.
Identifiers: Switzerland.

A committee of textile technologists and environmentalists has been formed within the Swiss textile industry. The committee is charged with formulating practical solutions to environmental problems affecting the textile industry, such as the elimination of non-degradable or toxic chemicals in waste water. Two test methods of the Swiss testing institute (EMPA) are discussed. (Orr-FIRL)
W76-06959

PURIFYING NEUTRAL WASTE WATER CONTG. DYES.
Netherlands Patent NL 7506-370. Issued December 2, 1975. Derwent Netherlands Patents Report, Vol. W, No. 51, p D2, January 27, 1976.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, *Dyes, Textiles, Ozone, Oxidation.
Identifiers: Dyeing wastes.

A method for treating dye-works effluents so that they are suitable for recycling has been patented. Neutral waste water containing organic dyes and auxiliary agents is subjected to continuous oxidative degradation in several stages with strong agitation. Ozone is used as the oxidizing agent. The amount of ozone applied is adjusted according to the duration of treatment and the oxidation parameters in each stage. This process provides for continuous operation with optimum use of ozone. No supplemental purification processes are required for complete degradation of the dyes and a wide range of dyes/auxiliaries can be degraded. Economical efficiency is assured due to the optimal use of ozone. (Orr-FIRL)
W76-06960

WASTE WATER NEUTRALIZATION WITH FLUE GAS (ABWASSER-NEUTRALISATION MIT RAUCHGAS),
A. Herren.
Textilveredlung, Vol. 11, No. 2, p 71-72, 1976.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Construction, Treatment facilities, *Neutralization.
Identifiers: *Flue gas, Dyehouse effluents.

German water protection authorities require that the effluent from dyehouses be neutralized prior to release to the sewers for treatment in regional effluent treatment plants. Cotton dyeing plants with predominantly alkaline effluents are beginning to use stack gas for the neutralization process. The construction and operation of an existing plant of Zofingen AG is described. The plant has been relatively trouble-free from its inception, and runs with a minimum of supervision, almost automatically. (Orr-FIRL)
W76-06961

IS COLLECTIVE WASTE TREATMENT THE ANSWER TO 1983,
H. W. Reiner.
Plating and Surface Finishing, Vol. 63, No. 2, p 11, 14-15, February, 1976.

Descriptors: *Waste water treatment, *Metals, *Industrial wastes, Treatment facilities, Waste water disposal, Recycling.
Identifiers: *Plating industry.

The use of collective waste treatment facilities for small job shops in the plating industry is discussed. With new federal effluent limitations planned for 1977 and the expected stricter enforcement of sludge and hazardous waste disposal requirements, such as treatment and disposal may be the only economically feasible solution. Presently, three major firms provide treatment and disposal services to platers. These are Liqwacon Corporation of Thomaston, Connecticut, Rollins Environmental Services, of New Jersey, Louisiana, and Texas, and Chem-Trol Pollution Services, Incorporated, near Buffalo, New York. These firms analyze a customer's sample before quoting a price for treatment and disposal. This price includes a per gallon charge, depending upon concentration, composition, and packaging of the waste, plus a transportation fee. Another collective waste treatment concept is to pipe the wastes directly from each plating shop to a centralized treatment facility. At the Mitchel Field Industrial Park near Levittown, Long Island, such a system is planned. The developer will build plant facilities to suit tenant platers in order to provide an economical method in compliance with federal, state, and effluent guidelines. Other suggestions for collective treatment have been made, including the pooling of resources by small job shops in a joint venture to recover sodium dichromate or chromic acid from their rinsewaters, which could then be sold to other industries. (Kramer-FIRL)
W76-06962

ELECTROLYTIC FLOTATION TREATMENT FOR HARMFUL HEAVY METAL WASTE WATER (YUGAI JUKINZOKU HAISUI NO DENKAI FUJOSHORI),
M. Ishii.
PPM, Vol. 7, No. 1, p 52-54, January, 1976. 18 fig, 5 ref.

Descriptors: *Industrial wastes, *Waste water treatment, Metals, *Heavy metals, *Electrolysis, *Flotation, Nickel.
Identifiers: *Plating waste waters.

Waste water treatment for heavy metals removal by the metal electrolytic flotation (MEF) method is described. The MEF method consists of three baths: an aluminum electrolytic bath, a coagulation bath, and a flotation bath. The method has been applied to the treatment of waste water from various types of factories, such as cadmium plating, photographic film processing, nickel plating, and metal cutting machinery. The MEF method allows the removal of heavy metals to lower concentration levels than does a simple precipitation method with pH adjustment. Waste water treatment can be made at a constant pH, and therefore involves no solution pH adjustment process. The method can also be used to remove oil components from water. If dissolved metal ions can be removed easily from the waste water by a simple pH admustment, such removal prior to the MEF treatment will help consume less electricity. For example, in treating cadmium plating waste water, cyanides in the water are treated by the alkaline chloride method, while the reduction of chromium is made by the sulfite salt method. The two treated waters are then combined for further treatment by the MEF method. When waste water from a photographic film processing factory with pH 7.9 was treated by both the pH adjustment precipitation method and the MEF method, the cadmium level in the treated water decreased to 0.72 ppm and 0.008 ppm with 20 minute and 40 minute MEF treatments, respectively. The former method alone could only reduce the cadmium level to 0.50 ppm at pH 11.2. MEF treated waste water from a metal cutting machinery factory had an oil content of less than 2 ppm, Cu 0.2 ppm, and Zn 0.2 ppm; the raw water had contained 35,000 ppm oil, 850 ppm Cu and 20 ppm Zn. (Katayama-FIRL)
W76-06963

EPA GRANT HELPS DETERMINE THE FEASIBILITY OF RECYCLING CYANIDE ZINC PLATING SLUDGE,
Industrial Finishing, Vol. 52, No. 2, p 26-30, February, 1976.

Descriptors: *Industrial wastes, *Waste water treatment, *Sludge treatment, *Metals, *Zinc, Treatment facilities, Grants, Costs, Recycling, Feasibility studies.
Identifiers: *Cyanide zinc plating sludge.

A pilot feasibility study was conducted at the Metal Plating Corporation, Connersville, Indiana, with the help of an EPA grant. The study investigated the recycling of cyanide zinc plating sludge. The complany treats zinc plating dragout with the Du Pont Kastone (peroxide and proprietary chemicals) process, then returns filtered sludge to the zinc plating bath. Following production and cyanide treatment, a conical boot at the bottom of the cyanide treatment tank collects about 70 gal of sludge. This is then pumped into a 300-gal secondary settling tank, where 20-30 gal clear liquid is removed by siphoning after overnight settling. The sludge, which contains 3-4% solids, is filtered and further concentrated. In the feasibility study, four to five filtering cycles were required, and the process was labor-intensive. When the plant is scaled-up from pilot to production, only one large filter will be required to dissolve entrapped solids. The sludge solids concentration after filtering will increase to 40-50%. No buildup of sludge cakes has been found to occur on the bottom of the plating tank. After one year of testing, the benefits of recycling were noted to be the elimination of sludge storage and handling, and a decrease in zinc anode consumption by 10 to 30%. Cost figures from the feasibility study indicated that the savings were approximately equal to the labor required for sludge recycling. On a full-scale system, however, labor costs will be reduced, providing a decrease of costs in the long run. (Kramer-FIRL)
W76-06964

SLUDGE FILTER HELPS MEET DISCHARGE REQUIREMENTS,
Industrial Wastes, Vol. 22, No. 1, p 30-31, January/February, 1976. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil wastes, Metals, Separation techniques, Sludge treatment, Filters.
Identifiers: *Vacu-matic sludge filter.

A new Vacu-matic sludge filter, now on stream at International Harvester's East Moline, Illinois, waste water treatment plant, has helped to meet NPDES permit conditions by discharging clean water and dewatered sludge. Wastes at the plant contain water soluble coolant from the machine shop, sawing and cut off operations, and heavy stock drilling; water from automatic parts washers; water from spray booths; spent caustic stripping solutions; and heavy machinery oils. With the new sludge filter, the facility processes 54,000 gallons of contaminated liquid every 24 hours, operating on a batch basis. Liquid is channeled to collection tanks, then piped to two 18,000 gallon settling tanks. A flotation separator skims sludge particles from the surface. Lime, alum, and anionic polyelectrolyte are added for pH control, breakdown of oil, and agglomeration and compaction of sludge particles. The Hoffman Vacu-matic sludge filter is then used for the dewatering process. This filter has an extended vacuum ramp to hold the cake under the influence of the vacuum chamber and air flow for a longer period of time, achieving a lower moisture content. The Vacu-matic delivers a dry cake, which is easily separated from the media prior to disposal. (Kramer-FIRL)
W76-06965

METHOD OF BIOLOGICAL PURIFICATION OF INDUSTRIAL EFFLUENTS FROM CHROMATES AND BICHROMATES,
V. I. Romanenko, S. I. Kuznetsov, and V. N. Korenkov.
United States Patent 3,941,691. Issued March 2, 1976. Official Gazette of the United States Patent Office, Vol. 944, No. 1, p 338, March, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Biological treatment, Municipal wastes, Anaerobic conditions, Chromium.
Identifiers: Chromates, Bichromates, Municipal-industrial wastes.

A biological method for the purification of combined industrial and municipal waste waters has been patented. Industrial effluents containing chromates and bichromates are mixed with domestic sewage. A culture of Bacterium decromaticans Romanenko B-1167 microorganisms is added to the effluents. Anaerobic conditions are maintained in the mixture until substantially complete reduction of the chromates and bichromates to chromium hydroxide is achieved. The culture is then separated from the purified water. (Orr-FIRL)

BIODEGRADATION OF POLYVINYL ALCOHOL IN WASTEWATER,
Du Pont Co., Wilmington, Del.
Q. D. Wheatley, and F. C. Baines.
Textile Chemist and Colorist, Vol. 8, No. 2, p 28-33, February, 1976. 6 fig, 6 tab, 30 ref.

Descriptors: *Industrial wastes, *Municipal wastes, *Waste water treatment, Textiles, *Biodegradation, Kinetics, Activated sludge, Biological treatment, Water quality control.
Identifiers: *Polyvinyl alcohol, Municipal-industrial wastes.

The use of polyvinyl alcohol (PVA) as a warp size for synthetic and cotton-synthetic blends in textile finishing operations is increasing. An investigation was conducted to assess the effect of PVA on municipal waste treatment systems by measuring the kinetic parameters for PVA biodegradation in an acclimated domestic waste activated sludge situation. Analysis of the data obtained from operating a laboratory scale completely mixed activated sludge process (CMAS) with domestic sewage mixed liquors inoculated with a microbial culture fully acclimated to PVA indicated that PVA removal greater than 90% and COD removals greater than 80% can be achieved when the product of the biomass solids and retention time is less than 1.3 g-day/liter and the total loading is less than 0.35 (lb COD/lbMLSS)/day. Eckenfelder's model was used to analyze the PVA continuous biodegradation data. Removal rate coefficients for PVA and COD were determined to be 1.2 liter/gal-day and 1.1 liter/g-day, respectively. It is concluded that PVA will not cause problems in meeting 1977 EOA goals for textile mills handling complex operations with blends; however, additional technology will be required to meet 1983 regulations. W76-06967

FLOATING AERATORS IN AUSTRALIA,
Water Services, Vol. 80, No. 959, p 36, 38, January, 1976.

Descriptors: *Waste water treatment, *Flotation, *Aeration, Equipment, Lagoons, Industrial wastes, Pulp and paper industry, Odor, *Australia.
Identifiers: Aerators.

The installation of Ames Crosta Simplex floating aerators solved an odor and biological growth problem for the town of Myrtleford, Victoria, Australia. The town's sewerage and the effluent from a paper mill is discharged into a primary and secondary lagoon system. The surface of the primary lagoon had become covered with a floating, fibrous mass and a serious odor problem was present. Three weeks after the installation of six 15 kW Simplex floating aerators, the floating material and associated odor had disappeared. The effluent from the secondary lagoon improved in quality after the aerators were installed. BOD was reduced from 160 mg/liter to 45 mg/liter and suspended solids were reduced from 400 mg/liter to 21 mg/liter. (Orr-FIRL)
W76-06968

SELECTING A MILL EFFLUENT TREATMENT SYSTEM--SOME CONSIDERATIONS.
Brown and Root, Inc., Houston, Tex.
D. R. Johnson.
Tappi, Vol. 59, No. 2, p 140-144, February, 1976, 2 fig, 3 tab.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Industrial wastes, Oxidation, Biological treatment, Activated sludge, Suspended solids, Biochemical oxygen demand, Treatment facilities.

The selection of an effluent treatment system for a particular pulp and paper mill includes considerations of space availability, regulatory agency requirements, climate, site topography, existing treatment facilities, the type of manufacturing process, and the total cost of the system. The aerated lagoon and activated sludge system are discussed in terms of their basic operating characteristics, and advantages or disadvantages of the two systems in pulp and paper mill applications are compared. The advantages of activated sludge systems include: the relative compactness; the inherent heat conservation; and, the capacity for adjustment to unanticipated or unusual waste characteristics by manipulation of the mixed liquor suspended solids level to adjust the F:M ratio to compensate for changing influent conditions. Disadvantages of activated sludge are the sensitivity to a shock load, the excess sludge generation, and the general sensitivity, or tendency to behave abnormally for no apparent reason. The advantages of aerated lagoon treatment include a very substantial ability to absorb pH and/or BOD shocks without upset and a general stability that is 'built-in' during the design and construction stages and is unaffected by operational changes. However, aerated lagoons are greatly affected by temperature variations. In conclusion, the activated sludge and aerated lagoon systems will both produce good quality effluents. A well designed aerated lagoon system will be simple, efficient, and predictable, while an activated sludge system must be knowledgeably operated to be efficient, and is not a simple system. The cost-efficiency of an aerated lagoon system decreases as the ambient temperature decreases, but an activated sludge operation is essentially climate independent. (Orr-FIRL)
W76-06969

CHEMICALS FROM THE PULP INDUSTRY,
Paper, Vol. 185, No. 1, p 19, January 5, 1976.

Descriptors: *Pulp and paper industry, *Chemical wastes, *Recycling, Sulfite liquors, *Waste water treatment, Industrial wastes, Sulfates, Chemical industry, Treatment facilities.

The pulp and paper industry has been steadily increasing its use of chemicals in its manufacturing processes while at the same time the production of chemicals from pulp and paper effluents has been increasing. These trends indicate increased cooperation between the pulp and paper industry and the chemical industry. Reuse of pulp and paper waste includes production of Torula yeast at the Salem, Oregon, plant of Boise Cascade. The Rhidelander, Wisconsin, plant of St. Regis Paper Company also produces Torula yeast. About 25,000 tons of desugared calcium lignosulfonate are manufactured yearly from pulping wastes. Lignosulfonate is used in vanalin production, oil well drilling muds, as concrete additives, and as dispersing agents. Cellulose Attisholz AG, Uterbach, Switzerland, produces about 5,000 tons of Torula yeast from spent sulfite liquor, as well as lignosulfonates, alcohols, methanol, furfural, and cymene. Finnish pulp and paper manufacturers are producing Pekilo-proteins in addition to Torula yeast from their effluents. Recovery of ethanol, methanol and acetic acid, and the production of furfural from hardwood chips are also practiced at Finnish plants. (Orr-FIRL)
W76-06970

PURIFICATION OF WASTE WATER FROM PAPER INDUSTRY,
S. A. Puzyrev, M. A. Evilevich, and Yu. I. Chernousov.
Soviet Patent SU-446-266. Issued May 3, 1975. Soviet Inventions Illustrated, Vol. W, No. 48, p D1, January 1976.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Patents, *Industrial wastes, Flocculation, Chemical precipitation, Sulfates, Coagulation.

A method for the purification of waste water from the production of cellulose paper has been patented. The effluent is first treated with a coagulant and the precipitate formed is removed. The pH of the water is then adjusted to 2-3 with acid, and a flocculant is added. The floc formed is then removed. Waste water from sulfate cellulose pulp processing was treated with a coagulant containing aluminum sulfate to precipitate the suspended lignin. After the precipitate was removed, H_2SO_4 was added to adjust the pH to 2-3. A flocculant, polyacrylamide, was added in an amount equal to 20-25 mg/g preciptate (on a dry weight basis). The precipitate from this step was removed and aluminum sulfate was again added to the water as a coagulant. The consumption of the coagulant decreased 3.0-3.5 times and the volume of the precipitate increased about 4-5 times. (Orr-FIRL)
W76-06971

THE ELECTROCHEMICAL TREATMENT OF INDUSTRIAL WASTE SOLUTIONS AND SEWAGE,
L. Redey, I. Kovacs, and I. Zorkoczy.
International Chemial Engineering, Vol. 16, No. 1, p 30-37, January, 1976. 4 fig, 20 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Electrolysis, Pilot plants, Treatment facilities, Iron, Oil wastes, Separation techniques, Electrodialysis.
Identifiers: Electrochemical treatment.

Electrochemical treatment is becoming an increasingly important treatment means for industrial wastes and sewage. A review of electrochemical methods and some actual examples are presented. Electroflotation is the process in which the coagulation of colloid solutions, suspensions, emulsions, and the floating of such agglomerates is facilitated by the evolution of gaseous hydrogen or oxygen at the electrodes. Electroflotation is being used to treat oily water from steel works, water containing paints or fibrous materials, and sewage. The alkalinization of the cathode space may enhance the formation of a hydroxide precpitate from the waste water being treated. Electrodialysis represents an electrochemical technqiue useful for such applications as reducing the salt content of the rinse water from galvanizing plants. Electrolysis is useful technique for the recovery of copper, silver, and sulfuric acid in metal finishing operations. Washing with an alkaline solution is widely applied in the petroleum industry to reduce the sulfur content of gasoline distillates. The spent solution, containing large amounts of sulfur compounds (mercaptans), can be regenerated and the sulfur compounds recovered by electrochemical processes. A schematic diagram of an alkaline

gasoline desulfurizing and washing solution regeneration system is presented. (Orr-FIRL)
W76-06972

RENOVATION TO MEET POLLUTION RULES COST TOM RABE $60,000,
National Petroleum News, Vol. 68, No. 3, p 60-61, March, 1976.

Descriptors: *Oil industry, *Oil spills, *Waste water treatment, *Industrial wastes, Water pollution control, Legislation, Treatment facilities.
Identifiers: Renovation, Oil spill prevention.

In order to comply with the Federal spill prevention control regulatons (SPCC), Albemarle Oil Company, Albermarle, N.C., a jobber for AMOCO, spent $60,000 remodeling an 18 year old bulk plant. The original facilities, including three 20,000 gal tanks for regular, on 20,000 gal tank for premium, two 15,000 gal tanks for diesel fuel, and tw 10,000 gal tanks for kerosene, were situated on a one-acre plot. An adjoining two acres were purchased. The existing storage was moved about 150 feet, two 30,000 gal vertical tanks for distillate storage were added, and a new top-loading rack was built. The tanks were drained of product, which was temporarily stored in tanks at old stations, and then lifted by crane to their new locations. Concrete pads were built in front of the storage area and the new rack to catch any spillage. Catch basins on the pads are connected to a 2,000 gal skimmer-type oil/water separator. The new work will enable the company to avoid any fines for non-compliance with the SPCC regulations. (Orr-FIRL)

PETROLEUM AND OIL WASTES DEGRADATION.
Belgian Patent BE 832-298. Issued August 11, 1975. Derwent Belgian Patents Abstracts, Vol. X, No. 2, p D3, February, 1976.

Descriptors: *Oil wastes, *Waste water treatment, *Industrial wastes, Biodegradation, Microorganisms, Biological treatment, Filtration, *Patents.

A method for the biodegradation of petroleum and oily wastes has been patented. An aqueous mixture of the effluent and a microorganism along with necessary nutrients are introduced into an aerated degradation system. The mixture is then passed to a second degradation system where a different microorganism is added. The microorganisms which might be used include various strains and mutants of Candida parapsiloxis, C. tropicatis, C. utilis, Aureobasidium pullulans, Myrothecium verrucaria, Cladosporium cladospoporiooides, Saccharomyces cerevisiae, Asperiguillus sp., Phodotorula sp., Candida lipolytica, Nocardia corallina, N. globerula, N. opaca, N. rubra, N. paraffinae, or Pencillium sp. Several tanks may be employed in each degradation stage, and filtration may be performed after each stage. (Orr-FIRL)
W76-06975

REMOVING PETROLEUM PRODUCTS FROM EFFLUENT WATER,
Soviet Patent SU 466-029. Issued July 11, 1975. Soviet Inventions Illustrated, Vol. X, No. 6, p D4, March 17, 1976. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, Oily water, Oil wastes, Separation techniques, *Patents, Equipment.
Identifiers: *Oil-water separator.

A method for removing petroleum contaminants from effluents has been patented. Preliminary cleaning of the effluent is accomplished by removing mechanical impurities on a vibrating sheet filter. The effluent is further cleaned by passing through a series of filter elements fitted with drainage pipes. The waste water is fed into a section of the cascading filter which contains floating polyethylene pices. After complete saturation, the petroleum droplets begin to coalesce and pass downwards into a storage tank. Oil can be withdrawn from this tank for reuse. The water passes down the filter and enters a space between the body of the filtering element and a coaxial screen. It then passes through the holes in the screen into the space under the drainage screen, flows through the filter cloth, and into the next lower stage. The process is repeated until the residual oil is separated from the water. All of the filter elements may be used at the same time, or some may be removed from service for cleaning. (Orr-FIRL)

APPROACH TO ENTIRELY CLOSED BOARD MILL BY ACTIVATED CARBON ADSORPTION (ITAGAMI KOJO NI OKERU KASSEITAN NI YORU HAISUI SHORI NI TSUITE),
R. Kimura, and K. Izumisawa.
Kamipa Gikyoshi, (Japan Tappi) Vol. 30, No. 1, p 20-26, January, 1976. 4 fig, 5 tab.

Descriptors: *Pulp and paper industry, *Industrial wastes, *Wastewater treatment, *Activated carbon, Activated sludge, Filters, Suspended solids, Biochemical oxygen demand, Effluents, Absorption.

Activated carbon adsorption treatment for waste water from a used-newspaper treating mill is described. Since activated sludge treatment was incapable of producing an effluent suitable for discharge, activated carbon was employed in the mill. The treatment system included a clarifier and two rapid sand filters. The effluent from these units was then passed through activated carbon towers. The sytem removed an average of 79.8% of the COD from the raw waste water, reducing the average COD level in the treated water to 9.2 ppm. Suspended solids and BOD levels in the treated water were also less than 10 ppm. The activated carbon was regenerated at 910 C to 930C. The loss of carbon be each regeneration was about 10%, and the regenerated carbon had the same adsorptive characteristics as the virgin carbon. Sulfur generation was observed in the treated water when operation of the system was extended, perhaps due to the presence of bacteria which reduce sulfate to sulfur. To eliminate this phenomenon, the tower was rinsed with sodium hydroxide every 10 to 11 days of operation. Carp and goldfish were raised in the treated water, and no difference in their growth was observed from fish raised in control situations. (Katayama-FIRL)
W76-06979

COATING FACTORY'S GROUPING IN THE CITY AREA AND ENVIRONMENTAL POLLUTION CONTROL (KISEI SHIGAICHI NI SONRITSU SURU MEKKI KOJO NO SHUDANKA TO KOGAI TAISAKU),
M. Oide, A. Morishima, and S. Nomura.
Kagaku Kojo, Chemical Factory, Vol. 20, No. 3, p 41-45, March, 1976. 6 fig.

Descriptors: *Industrial wastes, *Waste water treatment, *Chromium, *Metals, Treatment facilities, Separation techniques.
Identifiers: Japan, Cyanide wastes, Plating effluents.

The redistribution of seven metal plating factories in Kobe City, Japan, is described. These factories had been scattered throughout the city, and were relocated into one building for collective treatment and improved pollution control. Waste waters from each factory were collected into baths, separated into cyanide, chromium, alkaline, and acid solutions. The cyanide solution was treated by oxidation, reduction, and neutralization, before being channelled into a bath for pH adjustment. The chromium solution was treated with $Na_2S_2O_5$ and H_2SO_4, then passed into the same pH adjustment bath. The pH adjustment of the collected solution was accomplished in two steps, including flocculation. After the filtration of the flocculated materials, the solution was neutralized with H_2SO_4 before final discharge into the public drainage system. The total amount of waste water generated from the factories was 416.6 cu m per day; the treated water had a pH between 5 and 9. Suspended solids of the treated water were less than 80 mg/liter, total CN less than 0.7 mg/liter, total chromium less than 1.9 mg/liter, Cr(+6) less than 0.35 mg/liter, Cu less than 3 mg/liter, Zn less than 5 mg/liter, and Fe less than 10 mg/liter. (Katayama-FIRL)
W76-06980

TREATMENT OF WASTE WATER BY IMMOBILIZED ACTIVATED SLUDGE (KOTEIKA KASSEI ODEN NI YORU HAISUI SHORI),
K. Hayakawa.
Mizushori Gijutsu, (Water Purification and Liquid Wastes Treatment), Vol. 17, No. 1, p 53-62, 1976. 22 fig, 6 tab, 4 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Activated sludge, Ozone, Biochemical oxygen demand, Color.
Identifiers: Dyeing wastes.

Waste water treatment by immobilized activated sludge was studied and its application for dyeing factory waste water tested. The fixation of activated sludge on polyurethane sponge, polypropylene synthetic cotton, polyethylene sponge, and polyethylene thread was examined. All of the substrates could retain more than 3000 ppm sludge/liter. Polypropylene synthetic cotton retained the highest sludge concentration, approximately 13,000 ppm sludge/liter. Waste water from a dyeing factory was treated with activated sludge fixed on polyurethane sponge. More than 24 hours of aeration was required to remove 90% of the 300 ppm BOD in the raw water, however, three hours of aeration were sufficient to obtain a 100 ppm level of BOD in the treated water. COD removal efficiency was 40% and 70% after 1.5 and 48 hours of aeration, respectively. The treated water has a pH of 7-8, compared to a raw water pH of 10. The color intensity measured at 280 nm decreased to 10-60% of the color intensity of the raw water; intensity at 500 nm decreased to 10-80% of the original. Decolorization efficiency increased with increased aeration time, but not significantly. Although this treatment was sufficient to reduce the BOD to acceptable levels, it was necessary to inject ozone to the aeration bath in order to achieve acceptable COD values. (Katayama-FIRL)
W76-06981

HYDROGEN PEROXIDE FOR WASTEWATER TREATMENT,
W. H. Kibbel, Jr.

Public Works, Vol. 107, No. 1, p 60-62, January, 1976. 1 fig, 1 tab.

Descriptors: *Waste water treatment, Activated sludge, Odor, Biochemical oxygen demand, Suspended solids, Tanks, Safety, Chemicals, Transportation, Physical properties, Chemical properties.
Identifiers: *Hydrogen peroxide.

An increased usage of hydrogen peroxide in municipal waste water treatment has been noted. While the primary function of H2O2 is the removal of sulfide-caused odors, it also controls sludge bulking in activated sludge systems. When added to collection mains upstream from a treatment plant, hydrogen peroxide has provided additional dissolved oxygen to the plant influent and has improved plant efficiency in the removal of suspended solids and BOD. The physical and chemical properties of hydrogen peroxide are detailed and safety precautions for its handling are provided. Hydrogen peroxide is stable when stored properly, but contaminants, such as heavy metals and their salts, must be kept from entering storage containers and tanks and thus increasing the decomposition rate. Shipping equipment for H2O2 includes tank trucks, drums, and tank cars. Storage should be only in the original container and adequate ventilation and ample water for washing in the cases of accidental spillage should be provided. (Kramer-FIRL)
W76-06982

USING CORRUGATED STEEL TO SLASH SEWER COST BY 12%,
B. Jones.
Engineering and Contract Record, Vol. 88, No. 10, p 28-29, 32, October, 1975. 1 fig.

Descriptors: *Pipes, *Sewers, *Construction materials, *Steel, Pipelines, Waste disposal, *Construction costs, Joints(Connections), Asphalt.
Identifiers: Armco coupler, *Storm sewers.

Twin conduits of corrugated steel pipe have been installed in the construction of a 518 m storm sewer for the City of Beltsville, Ontario. The use of this construction material, rather than reinforced concrete, resulted in a costs saving of $50,000. The 12-gauge steel pipe, called Smooth-Flo, has spiral configurations with a lock seam. Two annular corrugations were rolled into helical corrugations at each end of the pipe so that a coupling system could be accommodated. A coating of asphalt was spun onto the inside pipe surface after fabrication in order to improve hydraulic characteristics. Because the pipe is flexible, crushed stone laid to a minimum of 15 cm had to be compacted to cover the grade before the pipe could be bedded. Once in position, O-ring gaskets were installed and special Armco couplers were bolted together, providing a joint with low infiltration and exfiltration rates. (Kramer-FIRL)
W76-06984

GETTING THE MOST OUT OF AN INFILTRATION/INFLOW ANALYSIS,
Texas Water Quality Board, Austin.
R. S. Jones, and D. W. Nelson.
Public Works, Vol. 106, No. 12, p 50-53, December, 1975. 1 fig, 5 ref.

Descriptors: *Infiltration, *Inflow, *Cost analysis, *Sewers, *Waste water treatment, Waste disposal, Operating costs, Maintenance costs, Repairing.
Identifiers: Infiltration/inflow, Cost effectiveness.

Suggestions for compliance with the infiltration/inflow (i/i) requirements of the Construction Grants Program are presented. The accepted definition of excessive infiltration/inflow is the quantities of i/i which can be economically eliminated from a sewer system by rehabilitation. The term 'excessive' has a purely economic meaning, and the determination of whether or not a sewer system is subject to 'excessive' infiltration/inflow must be based on a cost-effective analysis comparing the alternatives of transportation and treatment to a combination of survey, rehabilitation, and transportation and treatment of the remaining extraneous flows. Commonly misunderstood legal requirements include: the provision that all flows within the service area throughout a 20-year planning period must be accounted for; the computation of the interest rate for amortization and present worth comparisons of operational and maintenance costs at 6 1/8%; and the correlation of the estimated rehabilitation costs with the flow rates and conditions observed in each individual sub-system. (Kramer-FIRL)

FINE SIEVING DRUM FOR SOLID MATTER SUSPENDED IN WATER.
French Patent FR 2255-936. Issued August 29, 1975. Derwent French Patents Abstracts, Vol. W, No. 42, p D2, November, 1975.

Descriptors: *Patents, *Suspended solids, *Sewage treatment, *Separation techniques, *Waste water treatment, Equipment.
Identifiers: Sieving drums.

A patent has been issued for a fine sieving drum to treat solids suspended in water from sewage digestion tanks. The suspension is fed into the drum which has sealed end faces, rotating within an enclosed vessel. Clarified water is passed through woven wire mesh covering the drum; the solid matter is carried to a zone vertically above the axis of the drum. A higher pressure exists within the drum to prevent the solid matter from falling back into the sieve pool. This pressure, which holds the solids on the sieve without destroying the film of water across the holes, varies from 2.5 mm and 150 mm water column. The process is capable of achieving an effluent with 10 ppm of suspended solids. (Kramer-FIRL)
W76-06989

SETTLING TANKS.
South African Patent ZA 7303-195. Issued July 31, 1975. Derwent French Patents Abstracts, Vol. W, No. 42, p D1 November, 1975.

Descriptors: *Patents, *Sludge treatment, *Sludge disposal, Tanks, Equipment, Waste water treatment.
Identifiers: Sludge concentration, *Settling tanks.

The design of a settling tank has been patented. The tank has a flat base and a wall surrounding the base. Liquid to be treated is fed to a lower portion of the tank where a sludge blanket is maintained. A sludge concentrating receptacle is also located within the lower portion of the tank and defines a quiescent zone. The receptacle has an inlet above the base of the tank where sludge particles are received from the surface of the sludge blanket. An outlet discharges concentrated sludge from the receptable. CORRUGATED DRAIN PIPE.
Soviet Patent SU 393400. Issued April 18, 1975. Soviet Inventions Illustrated, Vol. W, No. 42, p 1, November, 1975. 1 fig.

Descriptors: *Patents, *Drains, Equipment, *Pipes, Flow rates, Construction materials, Filtration, Waste water treatment.
Identifiers: Corrugated drain pipes.

A patent has been granted for a corrugated drain pipe. The pipe has water openings at a vee-top and unequal chutes to increase strength and prevent blockage. Chutes are formed by the vee and space below the vee is filled with filtering material. One chute is provided for smaller effluent flows. Effluent is filtered through the filtering material when flow increases so that the first chute becomes full, water overflows to the second chute. The corrugations outside the pipe increase its strength. (Kramer-FIRL)
W76-06993

CLARIFIER WITH FLOATING FILTERING MATERIAL.
French Patent FR 2255-935. Issued August 29, 1975. Derwent French Patents Abstracts, Vol. W, No. 42, p D2, November, 1975.

Descriptors: *Patents, *Filtration, *Waste water treatment, *Clarification, *Sewage treatment, *Filters, Sludge treatment, Separation techniques, Equipment.

A clarifier has been patented for the rapid filtration of polluted liquids, including industrial effluents, waste water, and sewage. Low density filtering materials are arranged in a clarifying vessel and press against a retaining grid when the vessel is full. The grid can be made of a finely perforated metal sheet, wire gauze or a plastic material. Filtered liquid can be stored for use in counter current washing. When the filter is clogged, the vessel is partially emptied through a valve until the filtering material is de-compacted and the sludge eliminated. Liquid to be treated is filtered in an upward direction. Filtration may be combined with pre-settlement; heavy particles which would normally interfere with filtration are separated out in a simple step. Back-washing of the filter is rapid and requires only a small amount of water. (Kramer-FIRL)
W76-06994

SEPARATION OF WATER FROM AQUEOUS MIXTURES.
Netherlands Patent NL 7503-699. Issued October 3, 1975. Derwent Netherlands Patents Abstracts, Vol. W, No. 42, p D3, November, 1975.

Descriptors: *Separation techniques, *Patents, *Liquid wastes, *Effluents, Membrane processes, Temperature, *Waste water treatment, Polymers.

A process has been patented for the separation of water from aqueous mixtures by diffusion through membranes into liquids with temperature dependent miscibility. The mixture is brought into contact with one surface of an organic polymer membrane which is selectively permeable with respect to water. Part of the water will permeate into and through the membrane while the other surface of the membrane is contacted with a water-miscible 'sweep-liquid' whose miscibility with water depends upon the temperature range of the membrane. The water-enriched miscible phase is removed from the second surface of the membrane and the temperature of the 'sweep-liquid' is altered to a temperature outside the miscibility range. Thus liquid phases are formed which may be separated. The process has low energy requirements and low costs. (Kramer-FIRL)
W76-06995

BIOLOGICAL AEROBIC PURIFICATION OF EFFLUENT.
South African Patent ZA 7405-313. Issued July 29, 1975. Derwent French Patents Abstracts, Vol. W, No. 42, p D2, November, 1975.

Descriptors: *Patents, *Biological treatment, *Activated sludge, *Aeration, *Waste water treatment, Oxygen, Equipment, Effluents, Clarification.

A method of activated sludge treatment has been patented which uses an interchangeable aerator and clarifier. In this process, two adjacent basins are used for effluent treatment. The wastes to be purified are supplied to one basin which acts as the activated sludge basin; oxygen or an oxygen mixture is supplied to this basin. After a predetermined residence time, the effluents are passed to the second basin which acts as the final purification basin. Purified water is removed from the second basin until the activated sludge concentration in the first basin drops below a given value. The direction of operation is then changed, so that the second basin functions as the activated sludge basin and the first basin as the final clarifier. (Kramer-FIRL)

DENITRIFICATION METHOD BY BIOLOGICAL METHOD: RELATIONS BETWEEN DENITRIFICATION AND BOD5 (SEIBUTSUGAKU TEKI HOHO NI YORU DATSU-CHISSO-HO: DATSUCHITSU TO BOD5 NO KANKEI),
E. Mikami.
Kankyo Sozo, (Environmental Creation), Vol. 5, No. 7, p 41-45, July, 1975. 2 fig, 8 tab, 7 ref.

Descriptors: *Biochemical oxygen demand, *Nitrification, *Denitrification, Biological treatment, Microorganisms, Anaerobic treatment, Aerobic treatment, *Waste water treatment, Oxidation.
Identifiers: BOD5.

Biological treatment in the denitrification of waste water is discussed. The biological denitrification process involves two steps oxidation-nitrification and denitrification. Microorganisms used in the former step are aerobic microorganisms, while those in the latter are anaerobic. The function in the first step is to oxidize the BOD to ammonium ion, and then further to nitrogen dioxide or nitrate. The second process reduces the inorganic nitrogen compounds to nitrogen gas. With the use of individual oxidation and nitrification steps, it was found that 97% denitrification could be achieved for the waste water containing both high BOD and nitrogen compounds. STUDY OF THE REMOVAL OF PHOSPHATE FROM WASTE WATER BY LIME (UNTERSUCHUNGEN ZUR ABWASSERENTPHOSPHATUNG DURCH EINSATZ VON KALK),
F. W. Klages, and B. Meyer.
Gas-und Wasserfach-Wasser/Abwasser, Vol. 116, No. 8, p 370-372, August, 1975. 1 fig, 1 tab, 2 ref.

Descriptors: *Nutrient removal, *Phosphates, *Waste water treatment, Treatment facilities, *Lime, Sludge treatment, Biological treatment, *Chemical precipitation, Municipal wastes.
Identifiers: Phosphate removal, Ferric oxide.

Experiments on the preliminary removal of phosphates from the waste water of a municipal treatment plant are described. Residual phosphorus levels of 0.7-0.8 mg/liter could be achieved by adding slaked lime to reach pH values between 9.6 and 10. The slaked lime dose ranged from 125 to 210 g/liter. As a result of the slaked lime treatment, the volume of the sewage sludge decreased. Dry matter contents ranged from 8 to 14%, and good settling and dehydration of the sludge was achieved without additional conditioning. It was also possible to reduce the residual phosphorus content in the waste water to 0.25 mg/liter by coprecipitation with slaked lime and ferric oxide. (Takacs-FIRL)

EXPERIMENTAL STUDIES ON THE SEWAGE TERTIARY TREATMENT BY ROTATING DISC METHOD (KAITEN ENBANHO NI YORU GESUI 3-JI SHORI NO JIKKENTEKI KENKYU),
M. Ishiguro, Y. Watanabe, and S. Masuda.
Preprint, Japan Society of Civil Engineers, Tokyo, p. 528-529, 1975. 5 fig, 5 ref.

Descriptors: *Tertiary treatment, *Sewage treatment, *Biological treatment, *Nitrification, *Oxidation, Anaerobic conditions, Aerobic conditions, Denitrification, Activated sludge, Biochemical oxygen demand, Organic compounds, Turbidity, Effluents.
Identifiers: *Rotating disc method.

The tertiary treatment of sewage was studied using a rotating disc method. The facility consisted of four baths in series; each of these was equipped with several rotating discs 50 cm in diameter. The first three baths were for aerobic nitrification oxidation treatment and the fourth bath was for anaerobic denitrification treatment. The last bath was equipped with an apparatus to supply methanol. The rotating discs were operated at 5 to 10 rpm and the input of sewage water into the system was at the rate of one to 4.6 liters/min. Activated sludge treated water was used; parameters were: BOD, 22 to 60; COD, 10 to 50; TOC, 20 to 35; DO, 0 to 1.4; suspended solids (SS), 20 to 290; NH4-N, 20 to 110; T-N, 30 to 110; P04, 0.8 to 10 mg/liter; pH, 6.8 to 7.5; turbidity, 18 to 250, and temperature, 15 to 30 C. The effluent from the third bath contained BOD, 5 to 10; COD, 5 to 10; SS 10; ABS 0.1 to 0.4; P04, 0.6 to 6 mg/liter; and pH 6.7 to 7.0. The removal efficiency of BOD achieved by the first three baths was 85% and more than 90% for the 20 and 10 g/sq md loads, respectively. (Katayama-FIRL)

WASTEWATER TREATMENT PROCESS SENDS NUTRIENTS BACK TO THE LAND.
Engineering News-Record, Vol. 195, No. 22, p 18, November 27, 1975.

Descriptors: *Waste water treatment, *Recycling, *Construction, *Tertiary treatment, Ammonia, Nitrogen, Absorption, Ion exchange, Irrigation, California.
Identifiers: *Clinoptilolite, *Ammonia removal and recovery process(ARRP).

A 4.8 mgd advanced waste water treatment plant is under construction near North Lake Tahoe, California, and will be the first to include the ammonia removal and recovery process (ARRP). The process begins with a series of selective ion exchange beds that follow activated carbon treatment and includes closed-air towers and ducts in its stripping and absorption modules. As influent passes over 4-ft deep beds of clinoptilolite, the ammonium ions (concentrated at about 15 to 20 ppm) will be adsorbed. The remaining effluent will then pass through an 18-inch diameter pipe for chlorination and disposal. While all the waste water passes over the clinoptilolite, only the spent regenerant, enriched to an ammonium concentration of 300 ppm, is pumped to the stripping towers. There, sodium hydroxide converts the ammonium ions to ammonia gas, which is ducted to a smaller absorption tower and dissolved and concentrated. The liquid is pumped to storage tanks when the ammonium sulfate concentration reaches 40%. The solution leaving the absorption tower contains about 9% available nitrogen, suitable for direct irrigation by farmers or for blending by commercial fertilizer manufacturers. (Kramer-FIRL)

CRITERIA FOR THE EVALUATION OF THE EFFICIENCY OF SECONDARY SETTLERS (KRITEIY OTSENKI RABOTY VTORICHNYKH OTSTOYHIKOV),
A. I. Zhukov, I. V. Skirkov, and A. A. Bondarev.
Vodosnabzhenie i Sanitaranaya Teknika, No. 7, p 4-5, 1975. 1 tab, 2 ref.

Descriptors: *Activated sludge, *Aeration, *Waste water treatment, Treatment facilities, Equipment, Tanks, Sedimentation.
Identifiers: *Settling tanks.

Experiments were conducted to determine criteria for the efficiency of secondary settling tanks. The sludge index and the activated sludge concentration in the aeration tank were identified as universal criteria of the efficiency of secondary settling tanks, regardless of the design and of the type of activated sludge. One may substantially increase the throughput capacity of a purification facility by increasing the activated sludge dose in the aeration basin to a limit at which the normal operation of the secondary settler still exists. Descriptors: *Control systems, *Waste water treatment, *Domestic wastes, Treatment facilities, Chemical precipitation, Chemical oxygen demand, Suspended solids, Tanks, Model studies.
Identifiers: *Balancing tank, Waste water flow.

The control of domestic waste waterflow into a treatment plant by utilizing a balancing tank was studied. The amount of waste water discharged varied over time, causing an unstable waste water treatment operation. A balancing tank to regulate the input amount of waste water into the treatment plant gave more stable operation. The tank could be installed either to intercept all waste water flow before feeding into the treatment plant (thus passing a constant amount of waste water into the plant) or to intercept only excess waste water flow (and discharge this flow when the normal levels were lower). Using the second method, COD and SS concentrations at the final precipitation pool were measured and compared with those concentrations without the balancing tank installation. Without the balancing tank, the COD value varied from 100 to 1100 mg/liter and SS from 30 to 1370 mg/liter. With the balancing tank, the COD and SS values were relatively constant at 50 mg/liter and 10 mg/liter, respectively. (Katayama-FIRL)

CIRIA ASSESSES ITS MODEL WAY TO TREAT SEWAGE.
Surveyor, Vol. 146, No. 4353, p 16, November 14, 1975.

Descriptors: *Model studies, *Mathematical models, *Sewage treatment, *Treatment facilities, *Costs, Research, Computers, *Waste water treatment.
Identifiers: Cost-effectiveness models, Construction Industry Research and Information Association(CIRIA).

The progress of a project to create a mathematical model for optimizing cost-effectiveness of sewage treatment plants was discussed by the Construction Industry Research and Information Association (CIRIA) of Great Britain. The model was developed two years ago in order to aid the designer of a sewage treatment facility in choosing the combination of processes and the size of units which best suit the required degree of purification while keeping costs at a minimum. The present assessment will test the process modules, locate and correct errors in the original computer program, check the mathematical optimization procedures, and undertake sensitivity analyses. The original model used only conventional sewage treatment techniques, but the completed model will include new processes in its cost evaluation. Details of over 100 test runs of the model have been reported in a Report entitled, 'Cost-effective sewage treatment--an assessment of the prototype model.' In this report, the conclusions of designers and researchers are stated, and general benefits of the assessment period are summarized. (Kramer-FIRL)

INTERACTION OF ACTIVATED CARBON WITH DISSOLVED OXYGEN,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Chemical Engineering.
R. Prober, J. J. Pyeha, and W. E. Kidon.
AIChE Journal, Vol. 21, No. 6, p 1200-1204, November, 1975. 7 fig, 2 tab, 11 ref.

Descriptors: *Activated carbon, *Model studies, *Dissolved oxygen, *Laboratory investigations, Waste water treatment, Manometers, Sorption, Oxygen.
Identifiers: Packed columns, Rate data.

Experiments using manometric and packed column techniques to determine the rate and extent of dissolved oxygen sorption by activated carbon were performed. Several types of activated carbons were tested--granular and powdered, virgin and reactivated. All the carbons sorbed 150 to 600 micromoles/g of dissolved oxygen after run times of up to 1700 hours, but still not at equilibrium. Rate data conformed to a sorption model limited by intraparticle diffusion. The sorption of dissolved oxygen increased acidic surface oxides by about 200 microeq/gram; oxidation reactions were postulated, accounting for 10 to 50% of the sorbed oxygen. The data provide a new base line for oxygen uptake in the presence of organic solutes, bacterial growth, or catalytic oxidation processes. (Kramer-FIRL)

ECONOMIC SCRUBBERS FOR THE PROCESSING INDUSTRY,
Processing, Vol. 21, No. 11, p 12, November, 1975.

Descriptors: *Economics, *Odor, *Sewage treatment, *Oxidation, *Waste water treatment, Operating costs, Hydrogen sulfide, Treatment facilities, *Ozone.
Identifiers: Sodium hydroxide, Scrubbers.

Ozone has been used rather than NaOH as the oxidant to reduce H2S emission levels in exhaust gas emissions from sewage and other waste treatment facilities. When ozone and sodium hypochlorite were compared, the operational costs for ozone treatment were found to be lower. Tests have been carried out in Great Britain for the Northumbrian Water Authority using NaOH plus ozone as the scrubbing medium. An inlet flow with a level of 0.33 ppm H2S was used; after a single stage scrubbing the level was reduced to below 0.001 ppm. Unlike sodium hypochlorite, ozone is generated on-site and the reaction results in no unwanted byproducts. (Kramer-FIRL)

SLUDGE REMOVAL FROM DRYING BEDS,
Public Works, Vol. 106, No. 11, p 64, November, 1975.

Descriptors: *Sludge disposal, *Waste water treatment, *Municipal wastes, Construction, Equipment, *Sludge treatment, Cleaning, Recycling, Wisconsin.
Identifiers: Track-type loader, Sludge removal, *Sludge drying beds.

Sludge drying beds at a municipal waste water treatment plant in Hartord, Wisconsin, have been cleaned by a small track-type loader. Each bed has a 70,000 gallon capacity and is constructed with a 17-inch deep bed of graduated sand and gravel over a grid of 8-inch tile pipe. Dried sludge must be removed monthly. A heavy machine would break the tile drains; manual cleaning proved to be slow and costly. A one cubic yard, 65 hp track-type loader was found to be powerful enough to clean the beds efficiently but had a tolerable pressure on the tile of about 10.1 psi. The loader's bucket teeth were removed and the bucket edge was set so as to skim off the sludge. Dried sludge will be hauled to a pickup point where it may be distributed to local citizens for fertilizer. The loader then smooths out the sand surface to prepare the drying beds for the next sludge application. The entire operation for each 45 x 165 ft bed takes about four hours. (Kramer-FIRL)

NEW SEWAGE PLAN STUDIED ON WEST COAST,
Compost Science, Vol. 16, No. 5, p 9, Autumn, 1975.

Descriptors: *Sewage treatment, *Treatment facilities, *Burning, Pilot plants, Capital costs, *Waste water treatment, Equipment, Recycling, California.
Identifiers: Pyrolysis.

A new sewage treatment system is being developed in which a pyrolysis furnace burns or bakes material without the oxygen necessary in conventional combustion, at temperatures of up to 1500F, thus reducing the fuel to elemental carbon. This furnace may be used to process sewage sludge. Solids are extracted from the sewage and burned to produce the activated carbon which is then used to filter the remaining sewage effluents. The resulting effluent is of a quality at least as clean as the product of conventional two-stage sewage treatment. The only residue of this system is a small amount of inert ash, and no sludge is produced. The process was developed by space-flight engineers at the Jet Propulsion Laboratory in Pasadena, California. A two-million dollar pilot plant will be constructed south of Los Angeles with a capacity of one mgd. The plant will be financed by the EPA and by state and municipal funds. Capital costs should be about 25% below that of a conventional secondary treatment facility. (Kramer-FIRL)
W76-07038

POST-TENSIONING SYSTEM REPAIRS OLD DIGESTERS,
Brown and Caldwell, Walnut Creek, Calif.
Z. Beyaz.
Public Works, Vol. 106, No. 11, p 70-71, November, 1975.

Descriptors: Construction, *Sludge treatment, *Waste water treatment, *Treatment facilities, Repairing, Equipment, Costs, Concrete, Coliform.
Identifiers: Tensioning, *Digesters.

A new tensioning technique has been employed to rehabilitate a Stockton, California, treatment facility for about one third the cost of building a new facilitiey. Three primary sludge digester tanks of an old design have been modified. All existing rods and defective gunite to two feet below ground level were stripped and the walls were sandblasted. Then one to 1 1/4 inches of gunite was applied as a leveling coat to permit continuous contact of the new tensioning rods. The rods were

than paced and stressed. The new stressing method used 160,000 psi alloy steel bands which are assembled on the ground and pulled up as hoops or placed on hanger bars. Once in place, the ends of the bars are pulled together with a hydraulic scissors-jack. After the exact load is achieved, the bar ends are fastened with couplers and tension is checked. The method works well around pipes connected to the tank or through the tank wall. Labor costs are about 30% of the total tensioning costs. (Kramer-FIRL)
W76-07039

UNDERWATER SEDIMENT REMOVED WITH MINIMUM TURBIDITY.
Water and Pollution Control, Vol. 113, No. 11, p 9, November, 1975.

Descriptors: *Turbidity, *Waste water treatment, *Oil wastes, *Sediments, Cleaning, Reservoirs, *Settling basins, Sludge disposal, Industrial wastes, Mud, Equipment.
Identifiers: Mud-Cat.

A machine has been developed to clean sediment from the bottoms of municipal reservoirs and industrial settling ponds. The Mud-Cat, operated by Boice Construction of Edmonton, Canada, is a self-propelled barge fitted with an eight-foot wide horizontal auger mounted on a hydraulically operated boom. The Mud-Cat pulls itself forward along a guide cable along the water and scoops up weeds, mud, silt, sand, sludge, and industrial wastes. Turbidity is eliminated by a special mud shield located above the auger. The machine can remove from 50 to 120 cu yd of material per hour. The auger and cutter are hydraulically raised and lowered, enabling the machine to follow the natural contours of a pond bottom without damaging a natural or artificial seal. The Mud-Cat has been used by the oil industry, for an irrigation reservoir, for removing paper fiber wastes, and for cleaning flood silt, sludge, and coal slurries in the United States and Canada. (Kramer-FIRL)

AWT PLANT CUTS NUTRIENTS ECONOMICALLY,
Ayres, Lewis, Norris, and May, Incorporated, Ann Arbor, Michigan, Systems and Studies Department.
A. K. Singhal.
Water and Wastes Engineering, Vol. 12, No. 11, p 89-92, November, 1975. 2 fig, 4 tab.

Descriptors: *Waste water treatment, *Treatment facilities, *Tertiary treatment, *Biological treatment, *Aeration, *Polymers, Flocculation, Costs, Filters, Nutrient removal, Michigan, Nitrification.
Identifiers: Rotating biological discs, Sand filters, Ammonia nitrogen removal, Phosphorus removal.

Expansion of a Cadillac, Michigan, waste water treatment plant to include tertiary treatment facilities has been accomplished without disturbing the operation of the existing plant. The new advanced waste water treatment plant consists of a biological system attached to rotating discs, combined with shallow bed rapid sand filters. This achieves a very high quality of effluent, particularly in terms of phosphorus removal and nitrification. The use of rotating discs for ammonia nitrogen removal was compared with extended aeration; the rotating disc system was both cost effective and easier to operate and maintain. Tests have been conducted on process requirements. A full scale plant study using ferric chloride and polymer was also conducted. By moving the point of addition of ferric chloride towards the tail end of the aeration tanks and by attaining optimum shear velocity by adjusting the quantity of air, phosphorus removal efficiency has been improved from 60% to 85%. A rational approach for the design of a flocculation system for phosphorus removal in an aeration system was also detailed. (Kramer-FIRL)

BROOKHAVEN'S TWO SEWAGE TREATMENT PLANTS,
Brookhaven National Lab., Upton, N. Y.
M. M. Small.
Compost Science, Vol. 16, No. 5, p 7-9, August, 1975. 1 fig.

Descriptors: *Sewage treatment, *Water quality control, *Aeration, *Recycling, *Water reuse, Potable water, Aquaculture, *Waste water treatment.
Identifiers: Meadow/Marsh/Pond system, Marsh/Pond system, Land disposal.

Two schemes are being operated which treat 10,000 gpd sewage water on Long Island and return potable water to the groundwater supply system. A land intensive system, the Meadow/Marsh/Pond (M/M/P) scheme offers crops for harvest and sale. The second scheme, the Marsh/Pond system, requires less land. The M/M/P system consists of the dumping of raw sewage and septic tank sludges into a box where they are screened to remove bulky objects, passing these through a degritter to remove sand and other nondegradable material, and communition to reduce degradables to fines. The mixture is then passed into aeration ponds, treated by aeration, and pumped to a distribution header feeding overflow boxes at the heads of two sloped meadows. One meadow is used at a time; the other is dried for harvesting. By gravity flow through the sloped meadow, the influents are passed to a marsh, then to a stabilization pond stocked with aquatic species. With normal domestic sewage and sludges, pond effluent will be of potable water quality. An average of 50% of the treated influents are reused. The entire process takes place on an underlying impervious membrane so that no contaminants may be lost to the ground. Effluents are monitored prior to discharge. The Marsh/Pond concept is similar, but has no cash crop for nutrient removal and operates continuously, thus eliminating the margin for drying out, dry harvest, or operational corrections. The M/M/P system is a combination sewage treatment plant, aquaculture site, and farm. Cost analyses have not yet been performed. (Kramer-FIRL)

PILOT-SCALE WASTEWATER TREATMENT STUDIES,
Birmingham Univ. (England). Dept. of Civil Engineering.
T. H. Y. Tebbutt.
The Public Health Engineer, Vol. 17, p 129-135, September, 1975. 10 fig, 7 tab, 15 ref.

Descriptors: *Pilot plants, *Sewage treatment, *Performance, *Sedimentation, *Biological treatment, Sludge, *Waste water treatment, Treatment facilities.
Identifiers: Hydraulic loading.

A pilot scale sewage treatment plant was constructed at Birmingham University, Great Britain, in order to investigate the performance relationships for several unit processes in sewage treatment. Data on plant loading conditions, settling efficiency, performance of individual runs, and on the sludge characteristics were compiled and analysed. Results indicated that: the performance of a primary sedimentation tank is influenced by the hydraulic loading and also by the initial concentration of suspended solids. A modification of Fair's retarded biological oxidation formula, which involves expressing the degree of treatment as the product of mixed liquor volatile suspended solids and aeration time, provides an acceptable fit to semi-batch activated sludge data. It was also demonstrated that increased primary tank loading produces a decrease in the treatability of settled sewage with respect to biological oxidation. Additionally, the nature of the sludge produced from primary and secondary treatment will not be much affected by variations in the primary tank hydraulic loading. (Kramer-FIRL)

REVIEW OF EPA RESEARCH AND DEVELOPMENT LAGOON UPGRADING PROGRAM FOR FISCAL YEARS 1973, 1974, AND 1975,
National Environmental Research Center, Cincinnati, Ohio. Advanced Water Treatment Research Lab.
R. F. Lewis.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 3-14. 14 fig, 5 tab, 7 ref.

Descriptors: *Lagoons, *Aerated lagoons, *Oxidation lagoons, *Waste water treatment, *Reviews, Standards, Effluent, Suspended solids, Biochemical oxygen demand, Research and development, Waste water(Pollution), Algae, Sewage lagoons.
Identifiers: Tertiary lagoons, Facultative lagoons.

The Environmental Protection Agency Research and Development Program for upgrading the performance of lagoon waste water treatment systems is reviewed. Approximately 90% of all of the waste water lagoons in the United States are located in communities of 10,000 people or less. Therefore, very little monitoring or analysis of influents or effluents takes place. A comprehensive survey taken of lagoons all across the country evaluated biochemical oxygen demand and suspended solids for facultative lagoons, aerated lagoons, oxidation ditches, and tertiary lagoons. The EPA and its predecessor organizations have sponsored several meetings and research projects on the general topic of waste water lagoons and in a few cases on means of upgrading lagoons. A vigorous lagoon upgrading program has been spurred by the passage of new standards for effluent BOD and suspended solids. Research needs for lagoon upgrading, which have been identified by a variety of state, academic and private groups, are presented. Projects for fiscal year 1973 included the removal of algae from lagoon effluents and a revision of the manual on algae and water pollution. Projects for 1974 were on the performance of evaluating existing facultative lagoons and the Lagoon Workshop Symposium. Projects that were planned for fiscal year 1975 include a chlorine disinfection study, the nitrification of lagoon effluent with a rotating biological contactor, and combined nitrogen and phosphorus control in a lagoon. A summary of funding for lagoon upgrading projects is given. It is hoped that funds will soon be available to study well-designed aerated lagoons and aerated/facultative lagoon combinations. (See also W76-67047) (Pinto-FIRL)

POLISHING LAGOON EFFLUENTS WITH SUBMERGED ROCK FILTERS,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
W. J. O'Brien.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 31-46. 6 fig, 12 tab, 21 ref.

Descriptors: *Lagoon, Effluents, Rocks, *Filters, Algae, Chemical analysis, Alkalinity, Chemical oxygen demand, Biochemical oxygen demand, Suspended solids, Nitrogen, Phosphorus, Ammonia, Slime, Chlorophyll, Aeration, *Waste water treatment, *Filtration.

Identifiers: *Submerged rock filters, Algae removal, Filter life, Total suspended solids, Volatile suspended solids.

Lagoons have been widely used in small communities and isolated industrial plants in the United States for many years. Removal of algae from the final effluent can be costly if done by standard techniques. Submerged rock filters, which have the potential for avoiding this cost, have been tested in laboratory scale and pilot scale units. Field scale trials are reported in this paper. Two filters were tested: large rock and small rock. Samples were obtained from the lagoon effluent, the influent to the experimental lagoon and the effluent leaving the large rock and small rock filters, and were analyzed for total solids, volatile suspended solids, chemical oxygen demand, biochemical oxygen demand, ammonia, nitrogen, phosphorus, chlorophyll and pH. In the first six months of operation, the field scale installation responded the same way as the pilot scale had, as the biological slime layer was becoming established on the rock surfaces. Once this was established, the capture of suspended solids increased. Aeration facilities must be provided for the effluent part of the year. If the total alkalinity is greater than 260 mg/liter of calcium carbonate, there will be no odor problem. Effective filter life should be greater than 20 to 30 years. Rock sizes between 2.54 cm and 12.70 cm will make satisfactory filters. Most rocks in a filter should be within a range of 5 cm. More investigation is needed to investigate the relationship between rock size and hydraulic loading. Tentative guidelines can be designed for submerged rock filters. (See also W76-07047) (Pinto-FIRL)
W76-07049

STABILIZATION POND UPGRADING WITH INTERMITTENT SAND FILTERS,
Utah State Univ., Logan. Coll. of Engineering.
E. J. Middlebrooks, and G. R. Marshall.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 47-69. 8 fig, 19 tab, 13 ref.

Descriptors: *Oxidation lagoons, *Stabilization, *Ponds, *Lagoons, Sands, *Filters, Chemical analysis, Biochemical oxygen demand, Ammonia, Nitrates, Nitrites, Suspended solids, Oxidation, Algae, Utah, Standards, *Waste water treatment, Water quality standards, *Filtration, Sewage lagoons.
Identifiers: *Intermittent sand filters, Hydraulic loading rates, Algae removal.

Intermittent sand filtration can be used in communities surrounded by large areas of open land. The performance of the filters on a laboratory and pilot field scale was evaluated. Nine laboratory scale filters and nine field filters were evaluated. Sands used had effective sizes of 0.17, 0.35, and 0.72 mm. Hydraulic loading rates of 100,000 gpad, 200,000 gpad, and 300,000 gpad were used. Suspended solids, pH, and temperature were measured once every day, and samples were analyzed once a week for biochemical oxygen demand, ammonia, nitrate, nitrite, orthophosphate, phosphorus, suspended solids and pH. Hydraulic loading rate had little to do with any of the parameters in the laboratory tests, but in the field tests increased hydraulic loading caused a decrease in the suspended solids removal. Smaller size sands oxidized nitrogen compounds better. In the laboratory, hydraulic loading rates had little effect on the ability of sand to oxidize nitrogen. Ammonia primarily provided the nitrogen which was oxidized. After equilibrium was established, the intermittent sand filters did not remove a significant quantity of dissolved phosphorus compounds. BOD removal increased as the effective sand size decreased, as did algal and suspended and volatile solids removals. Some algae cells passed through the entire sand column without being removed. All waste water treatment plants can be upgraded by intermittent sand filtration to meet Class 'C' standards in the state of Utah. The process can be constructed and operated at a cost ranging between 15 and 47 dollars per million gallons of filtrate. (See also W76-07047) (Pinto-FIRL)

INTERMITTENT SAND FILTRATION TO UPGRADE LAGOON EFFLUENTS--PRELIMINARY REPORT,
Utah Water Research Lab., Logan.
J. H. Reynolds, S. E. Harris, D. Hill, D. S. Filip, and E. J. Middlebrooks.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 71-88. 15 fig, 6 tab, 9 ref.

Descriptors: Sands, *Filtration, *Lagoons, Effluents, *Filters, *Algae, Waste water treatment, Design criteria, Water quality standards, Standards, Chemical analysis, Suspended solids, Biochemical 0xygen demand, Chemical oxygen demand, Nitrites, Sewage lagoons.
Identifiers: *Intermittent sand filters, Hydraulic loading rates, *Sand filtration.

Intermittent sand filtration can be used in communities surrounded by large areas of open land. The performance of the filters in full-scale tests were evaluated and compared to results obtained using laboratory and pilot scale field intermittent sand filters. The ultimate objective was to develop design criteria that will consistently produce an effluent that would meet stringent water quality standards. Sand with an effective size of 0.17 mm was tested in six filters. Hydraulic loading rates of 0.2, 0.4, 0.6, 0.8, 1.0, and 1.2 mgad were used. Samples were collected and analyzed for suspended solids, biochemical oxygen demand, chemical oxygen demand, total phosphorus, orthophosphorus ammonia, nitrite, pH, temperature and dissolved oxygen. Different types of algae were used in this experiment from laboratory and pilot scale tests, but this had little effect on the filter performance. Results show that the length of the filter runs depended on the algal concentration and the hydraulic loading rates. The filter run was shorter in this test than in the laboratory and pilot scale tests. It varied from 14 days with a hydraulic loading rate of 1.2 mgad to 42 days with a hydraulic loading rate of 0.4 mgad. Twice as much of the total suspended solid matter was removed by filters with a hydraulic loading rate of 0.6 mgad than with a loading rate of 1.2 mgad. Suspended solids were reduced to less than 7.2 mg/liter from an average of 26.1 mg/liter and volatile suspended solids were reduced to less than 1.5 mg/liter from an average of 16.9 mg/liter for all filters. These full scale tests essentially confirmed the previous laboratory and pilot scale studies. (See also W76-07047) (Pinto-FIRL)
W76-07051

PERFORMANCE OF RAW WASTE STABILIZATION LAGOONS IN MICHIGAN WITH LONG PERIOD STORAGE BEFORE DISCHARGE,
Environmental Protection Agency, Washington, D.C.
D. M. Pierce.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 89-135. 4 fig, 15 tab.

Descriptors: *Stabilization, *Lagoons, *Storage, *Waste storage, Municipal wastes, *Waste water treatment, Illinois, Michigan, North Dakota, Minnesota, Coliforms, Bacteria, Suspended solids, Treatment, Discharge(Water), Chlorination, Aerated lagoons, Water quality standards, *Sewage treatment, Sewage lagoons.
Identifiers: Raw waste stabilization lagoons, Long period storage, Control short period discharge.

Conditions under which secondary treatment requirements could be met by raw waste stabilization lagoons are determined. Forty nine municipal lagoon systems typifying features of construction, loadings, and maintenance and operational practices which readily accomodate a common mode involving long period storage followed by control short period discharge were chosen in Michigan. Records from the forty nine plants were reviewed and recorded for analyses of BOD and suspended solids. These data were analyzed statistically in terms of probability of occurrence. In-depth studies were made of fecal coliform data to determine seasonal trends in their levels. No relationship was found between fecal coliform levels and BOD and suspended solids levels. Results showed that the lagoons studied can consistently produce effluents meeting EPA requirements for BOD and fecal coliforms and can generally meet standards for suspended solids. Supplementary studies were undertaken: to evaluate performance of raw waste stabilization lagoons in other northern states when managed in similar ways; to examine the methods in use and results of chlorination for coliform bacteria destruction both at lagoons so managed and those with continuous discharge; and to collect available data on nitrification phenomena. Other raw waste stabilization lagoons with long period storage and intermittent discharge were studied in Minnesota; North Dakota; Upper Penninsular, Michigan; and Belding, Michigan. Chlorination at continuous discharge stabilization lagoons was studied in Chesterfield Township, Michigan and Illinois. Chlorination of lagoon contents, lagoons following secondary treatment and aerated lagoons were also studied. (See also W76-07047) (Pinto-FIRL)

STATE OF THE ART OF LAGOON WASTEWATER TREATMENT,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
R. E. McKinney.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 150-20.

Descriptors: *Oxidation lagoons, *Lagoons, *Waste water treatment, *Reviews, Microbiology, Biological treatment, Effluents, Rainfall, Evaporation, Design criteria, Design, Temperature, Ponds, Sewage lagoons.
Identifiers: Multiple oxidation ponds.

Current knowledge on the advantages and disadvantages of oxidation ponds is discussed. Used extensively in small communities and isolated industries in the United States, oxidation ponds have the advantage of simplicity of construction, design and operation, along with the product of a highly stabilized effluent. It was found that oxidation ponds worked differently in different parts of the country. Little operational data had been gathered. There existed the need to know exactly how oxidation ponds worked and to examine the alternatives if it were found necessary to replace them. Studies showed that the size of oxidation ponds depends on the size of the population being served, the rate of rainfall compared to the rate of evaporation, and the length of the winters. Research performed on the biological reactions showed them to be much more complex than those that were previously thought to control the process. An understanding of the microbiology was not considered essential when designing oxidation ponds, but it could help. Temperature and temperature changes were found to be important in effecting metabolism rates. After a total evaluation of all the factors involved, it appears that oxidation ponds have their place in waste water treatment. With proper design using multiple ponds and adequate holding time and properly designed transfer and effluent pipe structure, oxidation ponds can produce a satisfactory effluent when considerations are made for evaporation. UPGRADING LAGOON TREATMENT WITH LAND APPLICATION,
Robert S. Kerr Environmental Research Lab., Ada, Okla. Water Quality Control Branch.
R. E. Thomas.
In: Upgrading Wastewater Stabilization Ponds to Meet New Discharge Standards, August 21-23, 1974, Logan, Utah, Utah State University, p 183-186. 9 refs.

Descriptors: *Lagoons, *Treatment facilities, *Waste water treatment, Overland flow, Infiltration, Crops, Percolation, Irrigation, Design, Effluents, *Sewage treatment, Sewage lagoons.
Identifiers: Secondary effluents, Land application.

Land application to upgrade lagoon treatment of waste waters is a promising approach. Some techniques that are not in common use at the present time include: crop irrigation; infiltration-percolation; and overland flow. The uses of these techniques are described with relation to developing technology and approaches that have been used for many decades. Crop irrigation is an alternative which has been used for many decades with a high degree of success under a variety of climatic conditions. Existing systems can provide much information on design and operating experiences which have led to problems as well as successes. Infiltration-percolation is another alternative which has limited but widespread use for advanced waste treatment of secondary effluent. This process usually follows activated sludge or trickling filters as the secondary treatment process. The information on design and operating experience following lagoon treatment is not extensive. Information on infiltration-percolation following other conventional processes for achieving secondary treatment can be used by those contemplating infiltration-percolation for upgrading lagoon treatment. Overland flow is being evaluated for upgrading secondary effluents and for complete replacement of conventional secondary treatment processes. (See also W76-07047) (Pinto-FIRL)

EVALUATION OF WASTEWATER TREATMENT PLANTS AT HENDERSON, NEVADA,
Environmental Protection Agency, San Francisco, Calif.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-240 253, $3.50 in paper copy, $2.25 in microfiche. May, 1973. 16 p, 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Treatment facilities, Nevada, Monitoring, Municipal wastes, Operation, Maintenance, Effluents, Filtration, Biological treatment, Salinity, Oxidation lagoons, Trickling filters.
Identifiers: Imhoff tanks.

A descriptive evaluation is presented of the two waste water treatment facilities owned by the City of Henderson, Nevada. The operation and maintenance of each plant was surveyed and waste water samples were collected in an effort to locate point sources of high salinity effluents. It was found that the Henderson Wastewater Treatment Plant No. 1, built in 1957, is operated and maintained in an acceptable condition. The plant uses two Imhoff tanks and two oxidation ponds in series and operates within the expected range of removal rates. However, the Henderson Wastewater Treatment Plant No. 2, built in 1943, was found to have deteriorated to an unacceptable condition. The two-stage trickling filter plant was designed for both industrial and municipal wastes. While the city is attempting to restore the plant to operable conditions, the many yeas of operation without proper maintenance have caused most of the units, piping, and pumps to need major repairs. Such repairs will be costly in both materials and manpower. (Kramer-FIRL)

MODIFICATIONS IMPROVE CHLORINE CONTACT CHAMBER PERFORMANCE, PART II,
Worcester Polytechnic Inst., Mass. Dept. of Civil Engineering.
F. L. Hart, R. Allen, J. DiAlesio, and J. Dzialo.
Water and Sewage Works, Vol. 122, No. 10, p 88-90, October, 1975. 6 fig, 3 tab, 15 ref.

Descriptors: *Chlorine, Hydraulics, Waste treatment, *Waste water treatment, Graphical analysis, Flow, Flow characteristics, Model studies, Tracers, *Performance, *Treatment facilities.
Identifiers: *Chlorine contact chambers, Plug flow system.

Part two of a study on modifications to improve chlorine contact chamber performance, presenting the second and third stages, is discussed. After establishing a hydraulic similarity between the field tank and the laboratory scale model tank in the first stage, a detailed study of the model tank flow patterns is conducted in stage two to provide data that will lead to model tank modifications. Results at three water levels are graphically presented. Undesirable hydraulic patterns were experienced and corrective measures were taken. Results for this modified chamber were also illustrated. In stage three, rhodomine WT dye tracer evaluations were conducted to determine the degree of hydraulic improvement to the chlorine contact system. Output response function values for the modified model chamber and a percent difference comparison with the unmodified model chamber were tabulated. The three sampling points are uniform for the modified chamber as compared to the unmodified chamber. The hydraulic pattern was shown to generally improve. A reduction of mixing patterns was indicated. Output response function data were graphically illustrated. The modified chamber approximates the ideal plug flow system closer than the unmodified chamber. (See also W76-03231) (Pinto-FIRL)

MODEL PLANT FOR BIOLOGICAL REMOVAL OF PHOSPHATE FROM COMMUNAL WASTE WATER, III. BIOLOGICAL PHOSPHATE REMOVAL FROM COMMUNAL WASTE WATER PRELIMINARILY CLEANED BY A BIOLOGICAL PROCESS (MODELLVERFAHREN ZUR BIOLOGISCHEN ENTPHOSPHATUNG KOMMUNALER ABWAESSER, III. BIOLOGISCHE ENTPHOSPHATUNG BIOLOGISCH VORGEREINIGTEN KOMMUNALEN ABWASSERS ENIES KALERWERKES),
G. Bringmann, and R. Kuehn.
Gesundheits-Ingenieur, Vol. 96, No. 10, p 249-251, October, 1975. 1 fig, 6 tab.

Descriptors: *Biological treatment, *Phosphate, *Nutrient removal, *Waste water treatment, Carbon dioxide, Filters, Municipal wastes, Microorganisms, Model studies, Pilot plants.
Identifiers: Phosphate removal, Ferrous chloride.

A model plant for the biological removal of phosphate from biologically pretreated municipal waste water has been developed. The purified waste water, with a neutral pH value stabilized by means of carbon dioxide, passes through four aerated biological filters. Ferrous chloride is added at a P:Fe ratio of 1:1.36 relative to the ferrous chloride demand of the complex plant. At an initial phosphate ion concentration of 10.42 mg/liter, the phosphate removal efficiency amounted to 99.93%, corresponding to a residual phosphate concentration of 0.007 mg/liter. The phosphate removal is performed by microorganisms which oxidize ferrous ions to ferric ions. Ammonium nitrogen does not interfere with the process. (See also W75-01765) (Takacs-FIRL)

ONSHORE TREATMENT SYSTEM FOR SEWAGE FROM WATERCRAFT RETENTION SYSTEMS,
General American Transportation Corp., Niles, Ill. General American Research Div.
A. J. Glueckert, and P. A. Saigh.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-239 630, $4.00 in ppaper copy, $2.25 in microfiche. Report EPA-670/2-75-007, March, 1975. 38 p, 8 fig, 9 tab, 24 ref.

Descriptors: *Waste water treatment, *Incineration, *Evaporation, *Sewage treatment, Costs, Energy, Domestic wastes.
Identifiers: Evaporative waste system, Watercraft sewage.

Sanitary wastes collected from watercraft at marina pumpout stations often contain high concentrations of chemical additives and are generally more concentrated than typical wastes entering municipal sewer systems. In order to treat these wastes, the General American Research Division of the General American Transportation Corporation has developed an Evaporative Toilet System (ETS) for the collection and treatment of such raw sewage. An evaporative waste system was tested by operating a propane-fired evaporator for 224 hours with in-house sewer wastes and wastes collected from marina holding tanks. The system treated 1,212 gal of sewage and concentrated the total solids of sludge from 0.5% to 12.4%. Concentrated sludge was then incinerated in a batch-type incinerator. It was demonstrated that this method is applicable as an alternative to hauling watercraft wastes to sewers or other disposal sites. The chemical additives had no deleterious effects on the evaporator. The evaporator required about one million kilocalories per 1000 liters of waste water evaporated; costs depended upon the price of the fuel used. (Kramer-FIRL)

FERRIC CHLORIDE AND ORGANIC POLYELECTROLYTES FOR THE REMOVAL OF PHOSPHORUS,
Grand Rapids Wastewater Treatment Plant, Mich.
O. Green, D. VanDam, B. LaBeau, T. Campbell, and S. L. Daniels.
Available from National Technical Information Service, Springfield, Va. 22161, as PB-239 866, $5.50 in paper copy, $2.25 in microfiche. Report EPA-670/2-73-103, February, 1974. 12 fig, 21 tab, 40 ref, 3 append.

Descriptors: *Polyelectrolytes, *Nutrient removal, *Phosphorus, *Waste water treatment, *Activated sludge, *Chemical precipitation, Flocculation, Treatment facilities, Polymers, Economics, Biochemical oxygen demand, Suspended solids, Heavy metals.
Identifiers: Ferric chloride, Organic polyelectrolytes.

A total phosphorus content of 1.0 mg/liter or less was obtained in the final effluent of a 44 mgd activated sludge plant at Grand Rapids, Michigan. This municipal waste water treatment facility consisted of chemical precipitation and flocculation systems of ferric chloride and an organic polymeric flocculant. Split addition of chemicals was practiced, with ferric chloride added to both the primary and secondary systems and flocculant added only to the secondary system. The performance and economic improvements obtained in other unit processes were also demonstrated. During normal flow these included: reduced organic loading to the activated sludge process, reduced BOD and suspended solids in the final effluent, additional heavy metals removal, and improved solids handling and disposal up to the limits of capacity. (Kramer-FIRL)

THE INVESTIGATION OF ION REMOVAL FROM WATER AND WASTEWATER,
General Electric Co., Philadelphia, Pa. Re-entry and Environmental Systems Div.
R. J. Starkey, Jr., M. E. Kub, A. E. Binks, and K. K. Jain.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-240 158, $6.00 in paper copy, $2.25 in microfiche. Report EPA-660/3-74-022, August, 1973. 38 fig, 19 tab, 14 ref, 6 append.

Descriptors: *Waste water treatment, Coagulation, Phosphorus, *Nutrient removal, *Cations, *Anions, Polyelectrolytes, *Water treatment, Adsorption, Dialysis, Organic compounds, Ions.
Identifiers: *Ion removal.

Capillary membrane dialysis, alumina adsorption, and alum/polyelectrolyte coagulation techniques were evaluated under laboratory conditions to determine their relative effectiveness in removing nutrients, cations, and anions from freshly collected samples of stream water and waste water effluents. Of these, alumina adsorption was highly effective in the removal of phosphorus, inorganic carbon, and most cations, and reduced specific conductance and hardness. High Kjeldahl and ammonia nitrogen removal efficiencies of alumina were observed only in samples of waste water where pre-treatment concentrations were relatively high. With alumina treatment, however, dissolved solids contents and pH increased. Dialysis was less effective than alumina adsorption regarding cation removal, but produced equivalent results with respect to inorganic carbon. Organic carbon concentrations were not significantly reduced, due to the association with macromolecules having a molecular weight greater than 5000. Dialysis was superior in the removal of sodium, potassium, chloride, nitrate-nitrite, boron, and dissolved solids. Coagulation was effective in removing phosphorus from all waters but was highly ineffective in respect to all the other parameters. (Kramer-FIRL)

THE INFLUENCE OF IRRIGATION BY MEANS OF DAIRY PLANT SEWAGE POURED OUT OF SPRINKLING PIPES ON THE YIELDS OF SOME PLANTS CULTIVATED ON SANDY SOIL AT LASKOWICE OLAWSKIE, (IN POLISH),
Instytyt Uprawy Nowozenia i Gleboznawstwa, Pulawy (Poland).
S. Zabek.
Pamiet Pulawski 60, p 19-32. 1974.

Descriptors: Irrigation, *Sewage, *Waste water disposal, Water reuse, Crop production, Nitrogen, Phosphorus, Toxicity, *Farm wastes.

The influence of irrigation by means of dairy plant sewage poured out of sprinkling pipes on plants (buckwheat, field bean, kale, potatoes and forage carrot) was studied at Laskowice Olawskie, Poland, from 1965-1966. Sewage was applied at 855, 1490 and 1680 m3/ha. In the group of treatments with sewage, a mean yield increase of 20% was obtained and in the group of sewage plus NPK the increase was 45% in relation to the yield with NPK fertilizing alone. These increases were 2-5 times lower than in analogous groups of treatments on the same soil under the sprinkling conditions of artificial rain or slope - flood irrigation. Kale and forage carrot in their early development stage cannot withstand the dairy sewage flood.--Copyright 1975, Biological Abstracts, Inc.

OPTIMIZATION OF EVAPORATION POND COST,
Bechtel Inc., Gaithersburg, Md.
S. C. Mehrotra.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE1, p 165-173, February 1976. 2 fig, 1 tab, 3 ref.

Descriptors: *Environmental engineering, *Evaporation, *Reservoirs, *Costs, Dissolved solids, Ponds, *Optimization, Water pollution control, Systems analysis, Equations, Mathematical models, Equilibrium, Behavior, Powerplants.
Identifiers: Cost minimization, Blowdown.

Transient and equilibrium behavior of a prismatic evaporation pond is studied for a given relationship between the evaporation rate and the concentration of the dissolved solids in the blowdown. It is demonstrated that equilibrium is established in relatively short time. By studying the equilibrium pond behavior, a cost function is developed, and the optimum equilibrium concentration for its minimization is found. The optimum area and volume of the pond can be calculated once the optimum equilibrium concentration has been found. An outline of the mathematical formulation for the general optimization problem involving a series of ponds is also presented.

SURVIVAL OF SALMONELLAE, TOTAL COLIFORMS AND FECAL COLIFORMS IN SWINE WASTE LAGOON EFFLUENTS,
Clemson Univ., S.C. Dept. of Microbiology.
D. J. Krieger, J. H. Bond, and C. L. Barth.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes - 1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 11-14.

Descriptors: *Farm wastes, *Salmonellae, Lagoons, *Farm lagoons, Waste water treatment, *Coliforms, *Hogs.

Survival characteristics were determined of Salmonella cholerae-suis, Salmonella typhimurium, total coliforms and fecal coliforms in swine waste lagoon materials. Columns of swine waste lagoon material were loaded with various population densities of S. cholerae-suis and S. typhimurium. Enumeration of total and fecal coliforms employed MPN methods utilizing lactose broth and E C. medium, respectively. Salmonella were determined by MPN methods using Tetrathionate Broth, and confirmed by plating on Brilliant Green agar and agglutination with Salmonella 0 antiserum poly A-1. Initial population counts of 2.5 x 10,000 organisms/ml of S. cholerae-suis and 7 x 100,000 organisms/ml of S. typhimurium decreased to non-recoverable levels in 24 days. Initial natural populations of 20 organisms/ml of fecal coliforms showed complete die-off after 10 days, and natural populations of 3.3 x 10,000 organisms/ml of total coliforms died off in 21 days. Survival times were also determined in columns which were loaded with high and low initial Salmonella populations. In all cases, the survival time of the organisms observed was determined by the initial numbers, whereas, the death rate of Salmonella was independent of the numbers in the original population. Antagonisms were not responsible for die-off rates. Depletion of an essential growth factor was probably the cause of death. (See also W76-07154) (East Central)

ECONOMIC IMPACTS OF ALTERNATIVE WATER POLLUTION CONTROL RULES ON BEEF FEEDLOTS OF LESS THAN 1000 HEAD CAPACITY,
Ohio State Univ., Columbus. Dept. of Agricultural Economics and Rural Sociology.
D. L. Forster, L. J. Connor, and J. B. Johnson.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign April 21-24, 1975, p. 41-44.

Descriptors: *Legislation, *Water pollution control, *Feed lots, *Cattle, *Economic impact, *Agricultural runoff, *Farm wastes, Alternative water use.

Estimates are made of the economic impacts of four alternative water pollution rules on the behavior of beef feedlots over the 1975-1985 period. The four alternative water pollution control rules applied to beef feedlots of all capacity levels were: (1) current EPA guidelines requiring control of feedlot runoff from the local 10-year, 24-hour rainfall and process generated waste waters by 1977 and runoff from the local 25-year, 24-hour rainfall and process generated waste waters by 1983; (2) the construction of control facilities for control of the local 25-year, 24-hour storm and process generated waste waters by 1983; (3) the control of all runoff from rainfall occurring in any six-month interval by 1977; and (4) the control of all runoff from rainfall occurring in a six-month interval and no winter spreading of feedlot solid wastes. A simulation model was used to represent the production behavior of beef feedlots typical of the Lake States and Corn Belt over the 1975-1985 period. Imposition of rule 1 on feedlots of less than 1,000 head would result in an average feedlot firm equity loss of $3,720 over the 1975-1985 period. Rule 2 would result in average equity loss of $3,911 over the 1975-1985 period. Rule 3 would result in average equity loss of $4,800 per feedlot. Rule 4 would result in an average equity loss of nearly $6,000 per feedlot over the 1975-85 period. The decline in marketing would range from one-half to one percent under the four rules over the 1975-1985 period, resulting in only nominal price increases for fed beef. Economic effects at the feedlot level would not be uniform, placing the greatest burden on the smaller feedlots. (See also W76-07154) (East Central)

ECONOMIC AND ENVIRONMENTAL ASPECTS OF DAILY AND ANNUAL DAIRY MANURE SPREADING SYSTEMS IN A SMALL WATERSHED,
Pennsylvania State Univ., Reading. Extension Service.
W. H. Schaffer, G. L. Casler, and J. J. Jacobs.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 53-56.

Descriptors: *Economics, *Dairy industry, *Watersheds(Basins), *New York, *Model studies, Nitrogen, Phosphorus, Small watersheds, *Farm wastes, Soils, Costs, Environment, Waste treatment.
Identifiers: *Land spreading, Soil loss.

Simulated nitrogen, phosphorus and soil loss are reported from a 7,000 acre watershed where daily manure spreading is practiced. Simulated results also are included when the system is changed to 12 months storage combined with direct incorporation of manure within 24 hours. The simulated nitrogen, phosphorus and soil losses from the two systems are incorporated into an analysis to determine the economic and environmental impact of controlling nutrients losses from the watershed under various policies. The physical model was constructed from published laboratory and field data and had sub-components for soil moisture, soil temperature, soil movement, nitrogen and phosphorus. The basic economic model was structured to be representative of the kinds, amounts and intensities of agriculture found by survey in a small central New York watershed. The modeling suggests that farm costs of reducing nutrient losses to water are substantial. In addition to the loss of nutrients to water, other environmental factors, such as odor, flies and appearance, should be considered when evaluating dairy manure handling systems. A summary of the cost and environmental impact, which is a combination of 7 environmental characteristics, of alternative dairy manure handling systems is included. Results indicate that manure handling systems need to be carefully evaluated for their economic and environmental impact. (See also W76-07154) (East Central)

TECHNIQUES THAT ARE SOLVING POLLUTION PROBLEMS FOR POULTRYMEN,
New York State Coll. of Agriculture and Life Sciences, Ithaca.
C. E. Ostrander.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 71-73.

Descriptors: *Poultry, *Waste treatment, *Waste treatment, *Waste disposal, Odor, Water pollution, Aeration, Dehydration, Economics, *Farm wastes, Oxidation lagoons, Feed lots.
Identifiers: Soil injection, Refeeding.

Poultrymen, who have struggled in the past with the pollution problem, are now accepting research information and putting it into practice. Some techniques are not economically feasible but many are. Some of the more applicable and successful are described. (1) The 'High Rise' poultry house, when constructed and managed properly, has aided in preventing pollution and provides maximum flexibility. Site selection and preparation as well as proper drainage and management are key factors for success. (2) Soil injection is very successful where odors from spreading anaerobic material is the primary problem. This does not prevent 'house odors' or odor from storage. Closed storages are required because soil injection may have to be a seasonal operation. (3) Dehydration can prevent odors if fresh material is used with proper equipment and adequate afterburners. Adequate markets are necessary if this is to be economically feasible. If the dehydrated product is approved for use as an animal protein supplement this will aid large producers with little land. (4) The oxidation ditch, which has a higher investment cost, can aid producers located in populated areas. This can be operated practically odor free and the effluent and/or sludge can be spread almost anyplace, at any time, without offending anyone. Effluent cannot be admitted to waterways without further treatment. (5) Surface aeration, much like the oxidation ditch, reduces odors. Being outside, it does not function as efficiently during cold weather in northern climates. There may be some odors during the spring when microbial activity increases. It is subject to 'slug loading' which may produce some odor and foaming. Sufficient volume and aeration are essential and it is probably more applicable in warm climate areas. CONTROL, COLLECTION, AND DISPOSAL OF FEEDLOT RUNOFF,
Nebraska Univ. Lincoln.
N. P. Swanson, L. N. Mielke, and C. L. Linderman.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 85-87.

Descriptors: *Regulation, Engineering, *Design, *Feed lots, Water pollution, Nebraska, *Farm wastes, Waste disposal, Waste treatment, Agricultural runoff.
Identifiers: *Runoff control.

As a result of pollution control regulations, many feedlots have instigated pollution control measures; but often they have done so utilizing fallacious concepts and without sufficient knowledge of engineering principles. The application of soil and water engineering principles has provided adaptation of practices and facilities to abate the water pollution hazard. Collection of hydrologic data from feedlots and interpretation of meteorological records have provided values for the parameters and variables involved in designs. Applications include diversions to eliminate surface runoff into feedlots, terraces to control overland flow within feedlots, basins and solids traps for the collection of runoff transported solids, riser inlets and underground conduit for conveyance of collected runoff, sumps and pumps to provide lift for feedlot drainage where gravity flow is not possible, holding ponds for storage of runoff effluent, pumping and distribution equipment for applying the effluent to the land, and management of effluent on crops and soils for nutrient utilization and control of pollution hazards. Full consideration of practices and techniques and avoidance of stereotyped concepts is necessary in engineering for pollution abatement of outdoor feedlots. Even then, failures can occur. The design of runoff controls on a feedlot must also provide for animal comfort, minimize management requirements, and keep investment and maintenance costs commensurate to potential income and benefits to the environment. MANAGEMENT OF RUNOFF WATER IN RELATION TO FEEDLOT OPERATIONS,
Soil Conservation Service Temple, Tex.
H. N. McGill, and G. C. Vittetoe.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 88-92.

Descriptors: *Agricultural runoff, *Feed lots, Economics, Lagoons, Irrigation, *Farm wastes, Operation, Waste disposal, Waste treatment.
Identifiers: *Land disposal.

The most practical and economical system for cattle feedlot runoff control is one where (1) as much outside drainage as possible is diverted from the feedlot, and (2) the runoff water from the feedlot proper is intercepted and impounded in holding ponds, and later disposed of on agricultural crops. Disposal lagoons designed to treat solid and liquid wastes from feedlots have very limited application in cattle feedlot pollution abatement systems due to the size of the surface areas required for such lagoons. Therefore, systems of retention and irrigation which result in a 'no-effluent' condition are best suited for cattle feedlots. In planning and designing the retention-and-irrigation-type abatement systems, the size of irrigated area in relation to the area of the feedlot must be considered for the varied conditions that can be encountered. Cattle feedlot runoff management tools that can be used for a wide range of climatic and management conditions. These tools relate annual precipitation to feedlot storage requirements and irrigation area-feedlot area ratios needed to prevent spills for specific frequencies. These can be used to (1) determine the size of area to prepare for disposal of runoff from a specific feedlot, (2) plan for the use of feedlot runoff as a source of irrigation water, (3) predict the climatic or moisture conditions at times when holding ponds must be dewatered and (4) evaluate the influence which storage capacity of holding ponds has on frequency of spillage from the ponds and the timing of irrigations with the runoff water. AN ILLINOIS FEEDLOT RUNOFF CONTROL PROJECT,
R. Lawfer.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 93-95.

Descriptors: *Illinois, *Feed lots, *Design, Sprinkler irrigation, *Farm wastes, *Agricultural runoff, Water pollution control, Waste treatment.
Identifiers: *Runoff control, Settling basin, Land spreading.

Reported are the experiences and observations of a farm owner-operator concerning the operation of a livestock waste management system installed on his farm in northwestern Illinois in the summer of 1973. This project was designed to prevent possible point source pollution from this feedlot, and to provide needed research on water quality, engineering design standards, and on disposition of livestock wastes. A continuing study by the University of Illinois involves collection and analysis of samples of water, plants and soil, to monitor the levels of chemical substances from manure in nearby wells and streams, and in soil. A summary of results is presented. This 'zero runoff' system includes a diversion, earthen dikes, a concrete basin for settling out waste solids, and a holding pond for temporary storage of liquids. Solids from the feedlot and settling basin are moved with solid manure handling equipment and spread on pasture or cropland. All contaminated runoff and liquid wastes from the feedlot are stored until they can be applied to the soil. A small solid set and movable irrigation system is used to empty the holding pond. Liquid from the pond can be applied through sprinklers to seven acres of cropland. Alternatively, a drain pipe allows pond liquid to be applied by gravity to a small area of permanent pasture by use of perforated pipe. An evaluation is presented of the system's performance during eighteen months of operation. Management skills and minor changes in design standards are recommended. (See also W76-07154)(East Central)

FEEDLOT WASTE RECYCLING WITH A FLUSH CLEANING SYSTEM,
Clemson Univ., S.C. Dept. of Agricultural Engineering.
C. L. Barth, and R. W. Goethe.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 96-97.

Descriptors: *Feed lots, *Waste storage, *Waste disposal, *South Carolina, *Design, Farm lagoons, Sprinkler irrigation, Southeast U.S., *Farm wastes, *Recycling.
Identifiers: *Flush waste handling system, *Land disposal.

Due to high rainfall, feedlots in the Southeast United States, require large amounts of labor and equipment to handle animal waste in solid form. Adverse weather conditions and cropping systems prevent continuous operation of solid waste handling equipment on cropland and interrupt work schedules. To combat the waste handling problem and odors, and to reclaim plant nutrients by recycling, Walworth Plantation near Eutawville, South Carolina, constructed in 1973 a 5,000-head capacity feedlot with a (water) flush waste handling system. This type system is not new to the animal industry but is unique in the beef feedlot industry. The feeding layout is constructed in a 'V' shape with 20 pens on each slope. The pens have a uniform slope of 2-1/2% to a central collection canal. Each pen is 30 feet wide, 120 feet long with a capacity of 125 head of cattle. The pens are constructed back to back with an unpaved working alley between the rows of pens. The central collection ditch diverts all runoff waste and water into a large concrete holding tank equipped with an agitator. The waste is agitated and pumped with a manure pump to a sprinkler irrigation system. The waste is applied on forage crops and pastures. As a back-up system in case of mechanical failure or prolonged adverse weather conditions, a 2-1/2-acre excavated lagoon and a 15-acre natural lagoon can be used to prevent discharge to streams and to comply with effluent guidelines for the feedlot industry. EVALUATION OF DAIRY, BEEF AND SWINE WASTE HANDLING SYSTEMS,
Michigan State Univ., East Lansing.
R. L. Maddex, T. L. Loudon, L. R. Prewitt, and C. H. Shubert.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 104-106.

Descriptors: *Livestock, *Dairy industry, *Confinement pens, *Waste storage, *Design, Agricultural runoff, Nutrients, Labor, Maintenance, Waste treatment, *Farm wastes, Hogs.
Identifiers: *Waste handling, Waste accumulation rates.

A variety of systems for handling and storage of animal waste have been constructed in the last few years. Some of these have been designed by Soil Conservation Service personnel or Extension agricultural engineers, but others have been planned and built by farmers themselves often patterned after systems they have observed on other farms. A study to evaluate the design criteria, labor requirements, mechanical maintenance, and level of management associated with these systems has been initiated. Seven dairy farms were initially selected for waste management studies. Two of the farms are total confinement operations with the remaining five having a combination of free-stall and outside paved lots. All but one farm have manure storage facilities. Runoff collection ponds are in operation on each of the farms that have outside lots. The project is being expanded to include additional dairy farms with different waste handling techniques as well as beef and swine facilities. Waste handling techniques on each of the farms under study are described. (See also W76-07154) (East Central)

LARGE PISTON MANURE PUMPS AND OUTSIDE MANURE STORAGES (EARTHEN BASINS),
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
R. E. Graves.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 107-111.

Descriptors: *Dairy industry, *Pumped storage, Lagoons, Wisconsin, Equipment, Costs, Design, Farm wastes, Central US, *Farm lagoons.
Identifiers: Midwest U. S. Solid piston pump, Hollow piston pump.

Because storage tanks under dairy barns of barnyards have such problems as high construction costs, gases and odors, and ventilation problems, some midwest dairymen are turning to storage ponds and lagoons. In the past conveying manure to these structures by means of tractor scrapers of conventional manure handling equipment has had its problems. In 1972, large piston manure pumps became commercially available in Wisconsin. These pumps provide an automatic method for manure removal from a barn to an outside storage structure. Manure may be conveyed through up to 200 ft of 10 in or 12 in pipe to the bottom of a storage area. The two variations in pumps are a solid piston pump which handles manure with or without long fibrous material, and a hollow piston pump which handles manure without long fibrous material. The hollow piston pump is cheaper and more readily available and is presently the most popular with free stall barns. Experiences with these systems are described, particularly agitation and emptying of these rather large (100 in to 200 in) earthen storage units. Various designs, pumping units and management methods are used. (See also W76-07154) (East Central)

ADAPTATION OF A BRITISH WASTE MANAGEMENT SYSTEM TO THE U.S. ENVIRONMENT,
Howard Harvestore Ltd., Bury St. Edmonds (England).
P. Jensen, G. Newman, and A. J. Peters.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 117-120.

Descriptors: *Waste storage, *Slurries, Design, Testing, *Farm wastes, Waste treatment.
Identifiers: *Waste management, *United Kingdom, Harvestore.

In the United Kingdom extensive and increasing use is being made of livestock waste management systems which feature above ground storage of liquid manure during seasons of the year when spreading on fields is either impossible because of bad weather or impractical because of poor timing for fertilizer application. Two factors have stimulated this activity--anti pollution legislation and the rapidly increasing cost of chemical fertilizers.

Howard Harvestore, Ltd., has been successful in the application of open top, above ground liquid manure storage vessels, called slurrystores, made of glass-coated steel Harvestore sheets. Their success in the U.K. environment has prompted much interest on the part of U.S. Harvestore dealers who want to apply the same kind of equipment to livestock pollution control in the U.S. Therefore a product design and development project, reported here, was set up with the purpose of testing the suitability of the slurrystore system in the U.S. environment, where seasonal temperatures both far above and far below the norm in England might make direct adaptation of the English system difficult. During the winter and spring of 1974, operational testing was conducted with four prototype systems, including two in Wisconsin, one in Missouri and one in Texas, with a variety of types and makes of pumps for loading, recirculating (agitating) and unloading the slurrystore structures. Some unexpected problems did arise but have been successfully resolved and the general conclusion is that the above ground slurrystore system, properly equipped and managed, can solve the farmer's waste management problem, and prevent pollution of streams. A WASTE MANAGEMENT SYSTEM FOR A 150-COW DAIRY--A 10-YEAR CASE STUDY,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
A. C. Dale, J. L. Albright, J. C. Nye, and A. L. Sutton.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 126-129.

Descriptors: *Farm lagoons, *Dairy industry, Lagoons, *Irrigation, Clogging, Pumping, *Farm wastes.
Identifiers: *Waste handling.

Some of the problems and successes of the waste handling facilities at the 150-cow Purdue Dairy Farm Center are described. Odor complaints and large labor load caused the farm to modify their solid waste handling facilities so that all wastes could be handled as a liquid. Two 34,000 gallon circular concrete holding pits were constructed. The manure was scraped to these holding pits, diluted with water, mixed and pumped with an impeller manure pump and hauled to nearby fields for disposal. However, odor was still a problem. A small sedimentation lagoon was constructed to control excess runoff. An aerator was placed in it to control odors. Later, a large anaerobic lagoon was constructed which received all the wastes. It was de-watered annually by conventional irrigation equipment. However rapid increase in solids level caused clogging problems in the nozzles. In 1973, a large 40 hp pump was employed to drive the irrigation system. It also developed clogging problems. The final solution for dewatering the lagoon was two pumps in series. The first pump was a large capacity trash pump; the second was the 40 hp unit. Experience with this system led to several conclusions. Material which will not decompose should not be added to lagoons to be used with irrigation systems. If mechanical and hydraulic devices are to be employed, some method of keeping the large non-biodegradable particles out of the waste is necessary. A solid waste handling should still be used for handling the lot scrapings particularly if bedding is used with large particles in it. If these large solid materials are removed, the lagoon system with irrigation dewatering works well for handling the dairy lot runoff. (See also W76-07154) (East Central)

A PLANNING STUDY ON DAIRY WASTES MANAGEMENT,
Webb (Albert A.) Associates, Riverside, Calif.
S. I. Gershon, S. A. Hart, A. C. Chang, and J. W. Branch, Jr.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 132-135.

Descriptors: *Dairy industry, *California, *Water pollution, *Groundwater, *Salts, Regulation, Planning, Waste treatment, Farm wastes, Evaluation.
Identifiers: Land disposal, Compost.

The major milkshed for Los Angeles, California is in the Chino Basin of the Santa Ana River Watershed, 25 miles east of Los Angeles. Approximately 165,000 dairy cows are located within a 120 square mile area. The manure from these animals is either applied to nearby farm fields or exported as compost. Nevertheless, mismanagement of waste storage and disposal contributes to surface and groundwater pollution problems. Concern about water pollution prompted the Santa Ana Watershed Planning Agency to retain consultants to study and recommend various management plans, including waste handling from various pollutant contributors. In one study, the consultants hoped to determine economically feasible methods by which the amount of salts added (about 50,000 tons of salt - total dissolved solids - per year) to the groundwater basin from the dairy industry could be reduced by 90%. An extensive data-gathering program was initiated. The extent of the salt problem was determined. Alternative means of collection, treatment, and disposal of the waste streams were evaluated. An economic analysis of the feasible alternative methods was made along with recommending a plan. Study results are given in detail. (See also W76-07154) (East Central)

MANURE PONDS FOR MINIMIZING POLLUTION,
Soil Conservation Service, Kewaunee, Wis.
A. C. Marini, O. J. Berry, and M. L. Knabach.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 141-143.

Descriptors: *Farm wastes, *Farm ponds, Farm lagoons, *Wisconsin, *Dairy industry, Costs, Design, Waste storage, Equipment, Water pollution, Waste treatment.
Identifiers: *Waste handling, Land disposal.

Wisconsin has long been noted for the production of dairy products. Throughout the years, the size of the dairy farms has steadily increased. However, the proximity of many of the livestock yards to perennial streams, many of which are trout streams, has not changed. As a result, the larger herds have increased the problem of handling the large volumes of manure produced each day. One method of handling these livestock wastes involves the use of manure pumps. Although the companies which fabricate manure pumps are few, a considerable number of these installations have been made. Many of these systems have been very successful. The manure has been removed from the buildings and successfully stored for the desired period of time while greatly reducing surface water pollution. The design and operation of a complete manure handling system for a farm located in Kewaunee County are described. Although this system was relatively inexpensive, the capacity is sufficiently large to store the total manure accumulation of 100 cattle for the entire winter season. Three major items are discussed: (1) the design of the overall waste management system, (2) the operation of the system including the application of the animal wastes onto the land in a manner which eliminates pollution, and (3) the equipment used and the storage facilities which effectively use earth embankments to store the waste. (See also W76-07154) (East Central)
W76-07176

A TOTAL RECYCLE UNIT SYSTEM FOR DAIRY MANURE MANAGEMENT,
Purdue Univ. Lafayette, Ind. Dept. of Agricultural Engineering.
A. C. Dale, and R. Swanson.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 144-146.

Descriptors: *Recycling, *Dairy industry, *Waste treatment, Slurries, Fertilizers, *Farm wastes.
Identifiers: Pollution control, Bedding, Soil conditioner, Refeeding.

Described is the Total Recycle Unit (TRU) System, developed by Babson Bros. Co., Oak Brook, Illinois, to mechanically handle and treat dairy cow manure. With the TRU System, part of the manure is converted to readily reusable products and the remainder is converted into non-pollutional end products. A field trial unit is undergoing final observations and monitoring prior to tooling up for production in the near future. The complete TRU System processes raw dairy cow manure as follows: (1) homogenizes the manure into a slurry in a primary collection tank, (2) pumps the slurry through a solids-liquid separator, (3) washes the first separated solids with 'clean' water to further remove mucous and dissolved solids, (4) ejects washed and final separated solids to storage for use as bedding, as a soil conditioner, or for refeeding to beef cattle, (5) returns some liquids to the mixing tank to dilute the incoming manure, (6) pumps the remaining liquid to the following: (a) storage for holding until irrigated onto cropland, (b) an aerator and thence to an electroflocculator for removal of minerals, (7) pumps the colored water through a clarifier producing a clear reusable or dischargeable water. In summary, the complete TRU System produces 'clean' solids, concentrated fertilizer and clarified water from dairy cow manure. However, only part of the system may be selected. For example, the electroflocculator could be eliminated with the liquid going directly to the holding unit for eventual use as a fertilizer or a substrate for bacteria to synthesize into proteins. SWINE PRODUCTION AND WASTE MANAGEMENT: STATE-OF-THE-ART,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
M. R. Overcash, F. J. Humenik, and L. B. Driggers.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 154-159.

Descriptors: Economics, Reviews, *Farm wastes, *Waste treatment, *Hogs.
Identifiers: *Waste management, *Pork production.

An exhaustive review of over 100 pertinent articles has been compiled in association with an EPA grant to critically evaluate the composite production-waste management strategies in the United States. A comprehensive systematic survey of the pork production industry was also conducted to add dimension to assessment of actual producer operations and problems relative to waste management options. This combined literature review and survey can provide excellent direction for future regulations and pork industry growth patterns. Information from literature references, extensive data retrieval and calculations have put the available waste characterization data on a uniform and thus more useable basis. The raw waste load and waste stream from various composite production-pretreatment systems are included for such parameters as liquid volume, COD, TOC, TKN, NH3-N, PO4-P, solids, K and trace elements. Finally a regrouping of traditional production

systems to reflect waste management considerations and economic costs for final application to plant-soil receiver systems is included. Such unit definition ranges from those with large volumes of wastewater or high nitrogen contents to those with minimal water and nitrogen in the waste stream. A discussion of the minimum cost effective parameters which could be monitored to evaluate or regulate performance of a waste management system with a terminal plant soil receiver system is included. SWINE WASTE NUTRIENT RECOVERY SYSTEM BASED ON THE USE OF THERMAL DISCHARGES,
Oregon State Univ., Corvallis. Dept. of Agricultural Engineering.
J. R. Miner, L. Boersma, J. E. Oldfield, and H. K. Phinney.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 160-163.

Descriptors: *Recycling, Anaerobic digestion, Algae, Methane, Design, *Hogs, *Farm wastes, Water reuse, Thermal pollution, Waste treatment.
Identifiers: *Nutrient recovery system, *Thermal discharges, *Single cell protein.

The feasibility of using waste heat from steam electric plants to sustain a food producing complex in which nutrients are recycled is being analyzed. Microorganisms are being used to convert animal manures into a high protein livestock feed and a methane rich fuel gas. Waste heat from the steam electric plants is used as a low cost source of energy for maintaining stable, elevated temperatures in anaerobic digestion and single cell protein production units. Much of the technology of the individual units is currently available. The objective of this project was to develop a system utilizing these units together and to establish design and operating criteria. The system consists of anaerobic digestion for liquifaction of solid material and soluble nutrient recovery by growing algae in basins heated with waste heat. The components of the system include: hydraulic manure transport, a solid-liquid separator, an anaerobic digester, aerobic basins for growing algae, harvesting equipment, and a soil-bed filter system for final removal of nutrients. The nutrient requirements of algae cultures are similar to the waste characteristics from swine. The design of the facility is based on the waste production of fifty swine. The facility is a livestock confinement building where the manure is flushed from the animal pens and routed to the nutrient recovery system. Flushing is done with sufficient frequency to prevent anaerobic decomposition and associated odors within the building. Clarified liquid from the nutrient recovery system is re-used in the process to flush wastes from the building. (See also W76-07154) (East Central)

MANAGING A SUCCESSFUL LIQUID SWINE MANURE MANAGEMENT SYSTEM,
Leanco Corp., Brownwood, Tex.
P. R. George, J. M. Sweeten, and S. P. Buchanan.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 164-167.

Descriptors: *Liquid wastes, *Waste treatment, *Farm, Lagoons, *Farm wastes, *Hogs, Waste disposal, Management.
Identifiers: Storage pits, Land disposal.

A modern 600-sow farrow to finish operation in Central Texas employs a three-phase system of efficiently managing liquid swine manure. The feeding system consists of two farrowing houses, two adjoining nurseries and eleven partially-covered finishing buildings. The two enclosed slatted-floor farrowing houses are underlain by ventilated 4 ft deep liquid manure storage pits. Separate storage pits are provided for each 30-sow room within the farrowing house to facilitate clean-out and enhance disease control. In all other buildings, liquid manure pits (beneath fully and partially-slatted floors) extend the length of the buildings. Anaerobic treatment is provided in these continuous flow storage pits, which have a theoretical manure storage capacity (detention time) of 70 days. The operators withdraw settled solids from the storage pits without agitation at two to three week intervals using honey wagons. This method of sludge handling was compared with chemical treatment of the pits from the standpoint of odor control. Sludge is hauled to adjacent fields and disposed of through plow-furrow-cover. Odors and flies are effectively controlled. No additional fertilizer is needed on the 100 acres of Coastal Bermuda grass pasture. Liquid overflow from the manure storage pits is conveyed 1/2 mile into a facultative/anaerobic lagoon for further treatment and eventual land disposal. This lagoon also receives runoff from the 100-acre solids disposal area and is designed to contain the 25 year frequency, 24 hour duration storm. Besides meeting the zero-discharge standard for both the feeding area and manure disposal area, the operation has been monitored for possible groundwater pollution problems. Piezometers have indicated no evidence of seepage from either the lagoons or from the liquid manure storage pits. (See also W76-07154) (East Central)

TOTAL WASTE MANAGEMENT FOR A LARGE SWINE PRODUCTION FACILITY,
F. J. Humenik, R. E. Sneed, M. R. Overcash, J. C. Barker, and G. D. Wetherill.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 168-171.

Descriptors: *Costs, Sprinkler irrigation, Ammonia, *Waste treatment, *Farm wastes, *Hogs, Management, *Farm lagoons, Aerated lagoons.
Identifiers: *Waste management, Land disposal, Zero discharge, Volatilization, Aerated basin, Anaerobic lagoon.

Consistent with developing animal waste management technology, this total system is centered around nitrogen and the pretreatment processes prior to terminal land application for the most feasible approach to a zero discharge system. The maximum production capacity of this breeder facility is about 200,000 lb on farm liveweight. Facilities have been developed to minimize wastewater generation in the totally enclosed buildings with manure storage pits under partially slatted floors. Site alterations included creek rerouting to optimize the production-waste management system. Wastewater pretreatment processes are a surface aerated basin (87,000 ft3) followed by an unaerated anaerobic lagoon. In addition, liquid from the unaerated lagoon is applied to a 1.5 acre site in which overland flow pretreatment is accomplished with this wastewater returningto the unaerated lagoon. Piping in conjunction with the overland flow and terminal irrigation system also allows use of secondary lagoon water for pit precharge and positive cleaning after pit emptying. These pretreatment processes effect nitrogen losses by ammonia volatilization and nitrification-denitrification as well as some degree of odor control. Final treatment or disposal of lagoon effluent is accomplished by a permanent set sprinkler system with manual control of laterals. The operational strategy, installation costs, and on-going costs are included. (See also W76-07154) (East Central)

TWO-STAGE ACTIVATED SLUDGE TREATMENT OF EFFLUENT FROM INDUSTRIAL HOG BREEDING FARMS,
Institute for Water Management, Bucharest (Rumania).
C. A. L. Negulescu.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 184-185.

Descriptors: *Activated sludge, *Waste treatment, *Farm wastes, *Waste water treatment, *Hogs, Effluents.
Identifiers: *Romania.

One of the problems which may be solved by the activated-sludge process is the treatment of effluents from industrial hog breeding farms. Romania has applied the system to breed hogs in a very limited area (structures of agro-industrial type for 100-150 thousand hogs). Since waste disposal by landspreading requires a large agricultural area, the possibility to treat the waste before disposal was considered.Studies started with the characterization of wastes; the results obtained are given as specific load (per capita). A few mechanical and natural-biological treatment plants were built but , the severe discharge conditions in some parts of the country required more efficient methods of treatment. The conventional methods used in sewage treatment have been tried with good results. On a laboratory scale (1970) and on full-scale (1972-73) Results of hog waste settling followed by two stage activated-sludge treatment were very hopeful (more than 95% efficiency). Descriptors: *Agricultural runoff, Nutrients, Irrigation, Design, *Waste disposal, *Farm wastes, *Feed lots.
Identifiers: *Land disposal, Field sink, Serpentine waterway.

Land disposal of collected feedlot runoff permits utilization of nutrients and of the water as irrigation. Runoff supplies, however, are not dependable, and facilities and equipment for storage and irrigation distribution require a minimum investment and periodic management irrespective of the size of the feedlot enterprise. Distant overland flow of feedlot runoff, under natural topographic conditions, prior to ultimate discharge into a stream has been judged not to be an environmental hazard in many states. Many feeders would prefer to assume some soil and crop management problems for direct disposal of runoff in lieu of storage and later distribution. This alternative is possible with the use of a field sink on a reasonably level disposal area or a serpentine waterway on a sloping site. Both are described in detail. Direct application on the land can save both investment and time for the many feeders with smaller facilities, and provide adequate protection for the environment. (See also W76-07154) (East Central)

DISPOSAL OF BEEF FEEDLOT WASTES ONTO LAND,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
H. L. Manges, R. V. Lipper, L. S. Murphy, and W. L. Powers.

In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 261-263.

Descriptors: *Feed lots, *Cattle, Kansas, *Crop response, Salts, Nitrogen, Equations, Agricultural runoff, *Farm wastes, *Application water.
Identifiers: *Land disposal, *Soil cores.

The objectives were to determine the optimum feedlot waste application rates onto land with a minimum of pollution to land and the ground water. The research was conducted in cooperation with the Pratt Feedlot, Inc., a 35,000 head commercial feedlot in Southcentral Kansas. Feedlot runoff and feedlot manure were spread onto different land areas at varying application rates for five years. Corn was grown on the waste disposal area. The corn was furrow irrigated from a well as needed for high corn yields. Feedlot runoff application rates were determined from inflow-outflow measurements in the irrigated furrows. Feedlot manure application rates were determined from the weight of manure caught on strips of plastic during spreading. Corn forage yields were measured by weighing forage mechanically harvested from test row. Soil cores were taken annually and analyzed to determine changes in chemical composition. Highest corn forage yields were obtained at waste application rates in excess of those necessary to supply the recommended nitrogen fertilization rates. However, there was a buildup of salts and nitrogen in the soil. At waste application rates necessary to supply the recommended nitrogen fertilization, corn forage yields were near maximum and salt and nitrogen buildup in the soil were not significant. Corn forage yield prediction equations have been developed from yield data from the waste disposal studies. These equations will be used in determining the most economical waste application rates, both feedlot runoff and manure. (See also W76-07154) (East Central)

OPTIMUM DILUTION OF SWINE WASTES FOR GROWTH OF LEMNA MINOR L. AND EUGLENA SP,
Tennessee Valley Authority, Muscle Shoals, Ala. Environmental Biology Branch.
R. A. Stanley, and C. E. Madewell.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 331-333.

Descriptors: *Fish diets, Algae, Oxygen, *Farm wastes, Hogs, Waste dilution, *Anaerobic condition, Tennessee Valley Authority, *Ponds, *Loading rates, Phytoplankton, Fish reproduction.
Identifiers: Anaerobic lagoons, Pond enrichment.

One means of animal waste disposal is the use of wastes to enrich enclosed ponds for increased production of fish or shellfish. This approach is being used at Woods Hole Oceanographic Institute for marine shellfish, and should work equally well for freshwater systems. Three possible systems that TVA intends to test are (1) Lemna minor L. (or some other duckweed) consumed by white amur, (2) algae consumed by a freshwater shellfish, and (3) algae consumed by phytoplanktivorous fish such as silver amur. The proper dilution rate for L. minor L. and phytoplankton was determined in glazed ceramic containers under greenhouse conditions. Containers held 8 l of fluid and had 350 cm2 surface area. Fluid for waste enrichment was obtained from a local primary treatment lagoon (anaerobic) that receives wastes from a swine feeding operation. Additions were made three times per week. L. minor L. from a local pond was added at 10 g fresh weight per container. Inocula for phytoplankton were obtained from a dilution series that had been spiked with seven water samples containing natural phytoplankton flora. About 2 g fresh weight of mixed phytoplankters was used to innoculate the experimental dilution series. Plants were harvested once a week, dried overnight at 70C, and weighed. Oxygen was determined with a YSI model 53 oxygen monitor. Loading rate for optimum growth of L. minor L. was 19 ml/l/wk. Dissolved oxygen during the day at this loading rate was normal (saturated), while at night oxygen was about one-half normal (saturated). Maximum growth of Euglena sp. was obtained at 150 ml/l/wk. Day and night oxygen concentrations at this loading rate were below 2ppm, a level reported to be tolerated by Asiatic clams and silver amur but considered dangerously low. The highest loading rate at which dissolved oxygen remained above 2 ppm, both day and night, was 38 ml/l/wk. (See also W76-07154) (East Central)

MANAGEMENT OF IRRIGATION FOR DISPOSAL OF FEEDLOT RUNOFF IN COLD CLIMATES,
North Dakota State Univ., Fargo.
R. W. Schottman, C. W. Thoreson, and J. K. Koelliker.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975. p 416-420.

Descriptors: *Irrigation, *Agricultural runoff, *Feed lots, North Dakota, Model Studies, Design, Climates, *Pumping, *Farm wastes, Management, *Waste disposal, Waste treatment.
Identifiers: Detention ponds.

Management of the pumping of livestock runoff to be used for irrigation is considered for several locations in North Dakota. Pumping durations, pumping rates and detention pond size and shape are simulated for stations having contrasting climatological conditions. Runoff events are predicted and are compared to the 10-year and 25-year, 24 hour storms for each station. All stations are characterized by at least a 90 day period of continuously frozen conditions and by a growing season of approximately 120-130 days. Runoff is predicted using a model similar to that developed by Larson at the University of Minnesota. The model has been expanded to allow specification of pumping rates and duration as well as pond size and shape. At least 30 years of daily precipitation and temperature records were used as input data for each station. The SCS runoff model is used as the basis for predicting the size of each runoff event. Runoff and pumping programs for two commercial feedlot operations were monitored and the observed water levels and runoff events were compared with predicted values. Design recommendations are proposed for the rather unique climatological conditions encountered in North Dakota. The model's applicability to other climatological conditions is also demonstrated. A LAGOON-GRASS TERRACE SYSTEM TO TREAT SWINE WASTE,
Missouri Univ., Columbia. Dept. of Agricultural Engineering.
D. M. Sievers, G. B. Garner, and E. E. Pickett.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 541-543.

Descriptors: *Waste treatment, *Anaerobic lagoons, *Performance, Effluents, Hogs, *Farm wastes, *Farm lagoons.
Identifiers: *Lagoon-grass terrace system, Chemical build-up.

The waste management system for a swine finishing unit (200 hd) was studied to determine its treatment effectiveness and to assess the system's effect on a nearby municipal water supply reservoir. The system consisted of a slotted floor over an anaerobic lagoon and an 850 ft. grassed terrace. During precipitation events, the lagoon discharged to the terrace where renovation and dilution of the effluent occurred. Leaving the terrace, the liquid flowed an additional 800 ft. and entered the small arm of a municipal water supply reservoir. The anaerobic lagoon was malfunctioning biologically due to chemical build-up. Attempts were made to improve biological activity in the lagoon by pumping the liquid fraction and diluting the sludge with fresh water. Samples of the lagoon effluent and flow in the terrace were analyzed for 14 chemical and physical parameters during a 0.9 inch precipitation event. Over 80 percent reductions in the concentrations of total volatile solids, Zn and Cu, and over 90 percent reductions in COD, BOD5, TKN, total P, Na and K were achieved in the terrace. Soil samples (to 4 ft., taken along the terrace channel) indicated that most chemicals held by the soil were largely removed in the first 200 ft of terrace. Controlled discharge of the lagoon coupled with the grassed terrace proved effective in protecting the reservoir from pollution. Annual pumping of the lagoon liquid and dilution of the sludge with pond water produced an average reduction of 50 percent of all measured parameters and resulted in improved biological activity. However, chemical concentrations built up within one year to higher levels, suggesting that the sludge must be removed to maintain a non-toxic environment in the lagoon. PRESENT KNOWLEDGE ON THE EFFECTS OF LAND APPLICATION OF ANIMAL WASTE,
Kansas State Univ., Manhattan. Dept. of Agronomy.
G. W. Wallingford, W. L. Powers, and L. S. Murphy.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 580-582.

Descriptors: Soils, Physical properties, Chemical properties, *Farm wastes, *Waste disposal, *Application rates, *Reviews, *Waste treatment.
Identifiers: Literature review, *Land disposal, Loading rates.

The purpose was to review the literature and analyze research needs on the effects of land disposal of animal waste. A secondary objective was to assemble published information on application guidelines for animal waste. Included is information on characteristics of the waste, effects of waste on soil and water near the application site, loading rates, application techniques and research needs. All usable waste characterization data were compiled and classified by climatic region, species (animal), and type (liquid or solid) of waste. The variability in composition within a climatic region, species and type of waste was so great that no general characterization could be made within each classification. Factors affecting the composition of the waste are discussed. Effect of land disposal on the physical, chemical and biological properties of the soil are discussed as well as its effect on groundwater quality below the disposal site, runoff quality from the disposal site, and plant growth on the disposal site. Benefits of animal waste disposal as well as the hazards of animal waste disposal on land are discussed. (See also W76-07154) (East Central)

ON-THE-FARM DETERMINATION OF ANIMAL WASTE DISPOSAL RATES FOR CROP PRODUCTION,
Washington State Univ., Pullman. Dept. of Soil Science.
D. O. Turner.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 587-590.

Descriptors: *Waste disposal, *Pacific Northwest U.S., *Crop response, *Farm wastes, Denitrification, Leaching, Equations, Dairy industry.
Identifiers: *Waste management, *Disposal rates.

Livestock operators in the Pacific Northwest need a means whereby they can estimate waste loading capabilities of their soils. Seventy percent of the 300,000 dairy cows in Washington and Oregon are west of the Cascade mountains in areas having heavy winter rainfall. Waste disposal poses pollution problems which are especially troublesome when alluvial soils are saturated. Waste handling and transport systems in conjunction with field applications are under study at three dairy locations; cattle populations range from 130 to 350 head. Two installations receive 40 to 60 inches annual precipitation; one gets 20 inches annual rainfall. Detention ponds for winter storage and pumppipe distribution systems are used at all locations. A soil injection system is also used at one site. Tile drainage effluent from beneath lagoons is being monitored for NO3-N and coliform bacteria at one location. The effluent is less polluted than the stream into which discharge occurs. Waste loading rates are being defined at all locations under field conditions. Crop removal of nitrogen is being measured with silage corn, cereal rye, and forage grasses. Nitrate-nitrogen concentrations in the forage are being determined as are NO3-N concentrations in the soil profile to a 4-foot depth. Results indicate large amounts of animal manure can be applied to soils in the Northwest without accumulation of toxic NO3-N in animal feed. A large amount of nitrogen is being denitrified. Soil nitrate leaching is minimal in the operations. (See also W76-07154) (East Central)

DISPOSAL OF DAIRY CATTLE MANURE ON SOIL,
Agricultural Research Service, Auburn, Ala.
Z. F. Lund, F. L. Long, B. D. Doss, and F. E. Lowry.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 591-593.

Descriptors: *Dairy industry, *Cattle, *Soils, *Crop response, *Forages, *Agricultural runoff, *Waste disposal, *Farm wastes.
Identifiers: *Land disposal.

Dairy cattle manure was incorporated into the surface 15 cm of a Norfolk sandy loam cropped with millet (Pennisetum americanum (L.) K. Schum) and rye (Secale cereale). Applications of 45 mt/ha/yr for 3 years resulted in BOD values of runoff water that did not exceed those for non-manured plots. The nitrate-nitrogen content of runoff water was essentially unaffected by the manure treatment. The same cropping system was used on plots of Dothan loamy sand, Lucedale sandy loam, and Decatur clay loam. Plots received 22.5, 45, 90, 180, and 270 mt/ha/yr of manure on a dry weight basis. The check plot received N, P, and K fertilizers totalling 450, 220, 450 kg/ha. The 180- and 270-ton manure rates caused plant injury the first year on both sandy soils. Millet yields were higher at the 45- and 90-mt/ha rates than on the check plots 2 out of 3 years. Both millet and rye forage produced on 180- and 270-mt/ha treatments had K/(Ca+Mb) ratios and nitrate levels that were potentially hazardous to animal health. Coastal bermudagrass (Cynodon dactylon (L.) Pers.) on Dothan and Lucedale soils received rates of 45 and 90 mt/ha/yr of solid manure and 45, 90, and 135 mt/ha/yr of liquid manure. Four applications of N, P, and K fertilizers were made to the check plots annually for a total of 470, 225, and 470 kg/ha. The mineral fertilizer plots yielded more forage the first year on the Dothan soil, and the second and third years on the Lucedale soils, than any manure treatment except the 90 and 135 mt/ha of liquid. Nitrate nitrogen in the forage was highly correlated with organic nitrogen in the plant tissue. Manure could be applied at the 45 mg/ha rate, either incorporated or on a Coastal bermudagrass sod, and produce nontoxic forage. (See also W76-07154) (East Central)

POLLUTION ABATEMENT OF POULTRY MANURE BY MAXI-MIXING METHOD,
Connecticut Univ., Storrs. Dept. of Animal Science.
W. A. Aho, G. F. Griffin, and A. K. Bakir.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 602-605.

Descriptors: *Poultry, *Costs, *Waste disposal, *Sampling, Nitrates, Nutrients, Anaerobic conditions, *Pollution abatement, Mixing, Waste treatment, *Farm wastes.
Identifiers: Maxi-mixing, *Composting.

Maxi-mixing is a term coined to describe a manure disposal system using a maximum amount of manure and a minimum amount of soil in a composting situation. Manure is returned to the soil system in massive quantities at low cost. Actual mixing is accomplished with a bulldozer or a payloader, folding manure and soil and windrowing. Odors are quelled almost immediately and under ideal temperature and aeration, composting occurs in several weeks. In November of 1970, 3,675 tons of poultry manure (59 tons nitrogen) were mixed in an area less than 2 acres. The area was too small to provide enough soil for a windrowed compost. The manure remained below ground level in a wet anaerobic state. The area surrounding this mass was sampled for nitrate and ammonia movement in 1971 and 1972. A brook flowing adjacent to the mix was monitored in 9 locations; 12 holes were also drilled to obtain ground water samples, and the farm well was sampled. No appreciable amounts of nitrates were found. The mix lay fallow from November, 1970 until April, 1974, when the site was required for disposal of another 6,300 tons of poultry manure. The site was appraised and soil sample analyses were made. The analyses of soil three years following massive manure mixtures indicated high pH values (8.1 to 8.2) in manure residual zones, relatively high soluble salts (83 to 90 mhos x 10 -5), very high ammonium levels (400 microgram N/g soil) and very high levels of extractable calcium, phosphorus and potassium. Only a trace of nitrite was found in the samples. After the second maxi-mix water samples taken from the adjacent brook and the farm well, showed no pollution from the maxi-mix. Cost of maxi-mixing was 62 cent/ton in 1970 and 60 cent/ton in 1974. (See also W76-07154) (East Central)

ON LAND DISPOSAL OF LIQUID ORGANIC WASTES THROUGH CONTINUOUS SUBSURFACE INJECTION,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
J. L. Smith, D. B. McWhorter, and R. C. Ward.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 606-610.

Descriptors: Liquid wastes, *Design, *Costs, Dairy industry, Labor, Colorado, *Waste disposal, *Farm wastes, Application rates, Injection.
Identifiers: *Land disposal, *Subsurface injection.

Design, development, and utilization of a continuous liquid manure subsurface injection system are discussed. With the system, liquid manure is pumped from a holding tank or lagoon to a disposal field through rigid pipe. A 660 foot flexible hose is used to connect the pipeline to the mobile injector. The manure is injected at depths of 4 to 6 inches below the soil surface and mixed with soil thus minimizing the possibility for aesthetic pollution. The injector can be operated with a medium sized agricultural tractor. Disposal capacity ranges from 400 to 800 gpm of 5% solid slurry depending upon the size of the equipment. A skilled operator can achieve application rates in excess of 50,000 gallons per acre per pass. The system is particularly adapted for use near population centers. The system is presented as an economically and environmentally sound alternative to current practices. Measurements of ground and surface water contamination are reported from on-going research where the system is being used on a dairy in Northern Colorado. The system offers significant savings in labor while improving the aesthetics of animal waste management. Operating costs are competitive with present systems. (See also W76-07154) (East Central)

EXTENDED PLAIN SEDIMENTATION,
West Pakistan Univ. of Engineering and Technology, Lahore.
K. M. Yao.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. EE3, Proceedings paper No. 11392, p 413-423, June 1975. 6 fig, 7 ref.

Descriptors: *Environmental engineering, *Sedimentation, *Suspended solids, *Water treatment, Design, Settling basins, Equations, Flocculation, Waste water treatment.

Extended plain sedimentation could be a possible alternative for pretreatment of surface waters in water purification. It does not add pollution to the environment and its sludge is less objectionable for disposal. Theoretical investigation shows that gravitational effect dominates settling down to the particle size of 1 micron. Experimental results indicate that extended plain sedimentation is technically feasible to remove a substantial amount of turbidity with residual turbidity down to less than 10 FTU. An 88% turbidity removal could be achieved in a settling tank of 7.5-day detention. Suspended solids concentration appears to be more appropriate as an indicator of the performance of settling of natural waters. From the viewpoint of functioning of settling tanks, extended plain sedimentation should mean extension towards a lower design overflow rate rather than towards longer detention periods. (Bell-Cornell)

EFFLUENT IRRIGATION OF PEARL MILLET,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
A. R. Overman.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. EE2, Proceedings paper No. 11233, p 193-199, April 1975. 3 fig, 4 tab, 7 ref.

Descriptors: *Agricultural engineering, Environmental engineering, *Irrigation, *Sewage treatment, Water pollution, Measurement, Equations, Nitrogen, Potassium, *Water reuse, Forage.
Identifiers: *Effluent reuse, *Waste water reuse, Nutrient recovery.

The summer forage crop pearl millet (Pennisetum typhoides (Burm) Stapf and E. C. Hubbard), Tiftlate variety, was grown on Lakeland fine sand under irrigation with secondary municipal effluent. Irrigation rates from 2 inches/week to 8 inches/week (50 mm/week to 200 mm/week) were used. Two cuttings were obtained over a 25-week growing period. Dry matter content decreased with irrigation rate, while plant uptake nutrients (except iron) showed an increase. Recovery efficiency of all nutrients measured decreased with application rate. Adequate levels of nutrients for crop fertility were present in the effluent with the exception of potassium. An irrigation rate of 2 inches/week to 4 inches/week (50 mm/week to 100 mm/week) for pearl millet on sandy soil appears quite suitable. (Bell-Cornell)

RECLAMATION OF WOOD-CHIP CARRIER WATER,
North Carolina Board of Water and Air Resources, Raleigh.
J. M. Shane, N. S. Hawthorne, and T. Asano.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. EE2, Proceedings paper No. 11231, p 215-228, April 1975. 10 fig, 5 tab, 8 ref.

Descriptors: *Environmental engineering, *Hydraulic transportation, *Oxidation, *Wood wastes, Adsorption, Biochemical oxygen demand, Chemical oxygen demand, Coagulation, Lime, Pipelines, Water pollution control, Water treatment, *Waste water treatment.
Identifiers: Wood, Carrier water.

One of the major factors affecting the feasibility of hydraulic transport of wood chips is the effect of substances leached from wood chips into the carrier water during the transit period. An investigation was made to determine the feasibility of treating wood-chip carrier water for pollution control or removal of contaminants, or both, for potential reuse. Several treatment operations and processes were investigated, including biological oxidation, chemical coagulation by lime addition, carbon adsorption, and chemical coagulation followed by carbon adsorption. OPTIMIZATION OF DENITRIFICATION PROCESS,
Vermont Univ., Burlington. Dept. of Civil Engineering.
R. P. Michael, and W. J. Jewell.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. EE4, Proceedings paper No. 11532, 8 fig, 3 tab, 23 ref. August, 1975.

Descriptors: *Waste water treatment, *Optimization, *Denitrification, *Environmental engineering, Water quality, Hydraulic systems, Kinetics, Mixing, Nitrogen.
Identifiers: *Two phase flow, Microbes, Process control.

A denitrification system composed of a completely stirred tank reactor (CSTR) followed in series with a plug flow reactor (PFR) was tested in order to minimize the disadvantages of each process when used separately. High efficiency of nitrate-nitrogen removal and good process control can be achieved with the series treatment system using 25% of the volume required with a single CSTR reactor. Most influent nitrate-nitrogen concentrations were greater than 1000 mg/l, and these usually result in effluent concentrations less than 0.5 mg/l. The effluent nitrate-nitrogen concentration was reduced to less than 0.5 mg/l with a total hydraulic detention time of 1.7 hr. when the influent nitrate-nitrogen concentration was 80 mg/l. Design conditions which would minimize treatment volume requirements would include microbial mass loadings (grams nitrate nitrogen/grams volatile suspended solids/day) in the CSTR and PFR of 2.0 day, and 0.2 day, respectively, resulting in a 40% removal efficiency in the CSTR reactor and greater than 95% nitrate-nitrogen removal efficiency in the total system. The microbial yield averaged 0.11 grams volatile suspended solids synthesized per gram of chemical oxygen demand removed. (Bell-Cornell)

Descriptors: *Water resources, *Flow, *Sewage disposal, *Simulation analysis, *Optimization, Combined sewers, Detention reservoirs, Drainage, *Water pollution control, Storms, Rainfall, Runoff, Mathematical models, Systems analysis, Automatic control, Waste water(Pollution), Management, California.
Identifiers: *Control strategies, San Francisco(Cal), Vicente Subbasin.

Simulation and optimization techniques were employed in developing strategies for the operation of detention reservoirs for the control of combined sewer overflows. A single subbasin reservoir system in the San Francisco Plan for Wastewater Management was used as a case study. A relatively simple quantity simulation model was constructed and used in conjunction with both artificial and long-term historical rainfall data to develop and evaluate various general control strategies. The emphasis was on off-line simulation and optimization leading to development of operating rules that require only predictions of storm depth and effective duration of real-time use. It was concluded that substantial improvement in system performance can be achieved by utilizing some type of control strategy over a no control policy. Reduction in average overflow volume per year of up to 38% and in overflow events per year of over 43% were achieved. (Bell-Cornell)
W76-07236

WASTEWATER REUSE BY CONTINUOUS ION EXCHANGE,
Avco Systems Div., Wilmington, Mass.
H. Gold, and A. Todisco.
In: Complete WateReuse: Industry's Opportunity, April 23-27, 1973, American Institute of Chemical Engineers and Environmental Protection Agency--Technology Transfer, p 96-103. 3 fig, 1 tab, 13 ref.

Descriptors: *Waste water treatment, *Water reuse, *Ion exchange, *Water treatment, Economics, Resins, Cost comparisons, Industrial wastes, Recycling.
Identifiers: Continuous moving bed, Regeneration, Continuous ion exchange.

Ion exchange has been used in industry for many years in the recovery of valuable substances from industrial liquids and the purification of these liquids for their reuse. It is the treatment of water with solid adsorbants. The economic limitation on this process comes from the expensive regenerant that must be used in order to obtain the original ion

exchange resin again. Difficulties arise because in many cases, substances that are to be removed are in low concentrations. Most of the ion exchange units presently in use are of the conventional downflow fixed bed, batch operated type. The Avco continuous moving bed process is described. This design consists of a moving bed in which the resin is kept continually moving through the column. The ion exchange, regeneration and wash operations occur simultaneously in the same column. Some operating problems resulting in higher maintenance costs have been experienced in continuous bed systems, but these must be weighed against the cost advantages resulting from higher regeneration efficiencies and lower waste stream volume. Principles of operation of this system are illustrated for water softening. Tests were carried out to evaluate the performance of this system. The most critical problem was the propulsion of the resin bed in a steady plug flow against the effects of bridging and pulsing. Hydraulic and mechanical properties of the moving packed bed system and the effects of compaction on permeability of the resin bed were investigated. (See also W76-05314) (Pinto-FIRL)

THE HELICAL BEND COMBINED SEWER OVERFLOW REGULATOR,
American Public Works Association, Chicago, Ill.
R. H. Sullivan, R. R. Boericke, M. M. Cohn, G. Galina, and C. Koch.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-250 619, $6.00 in paper copy, $2.25 in microfiche. Report EPA-600/2-75-062, December 1975. 124 p, 92 fig, 11 tab, 31 ref, 3 append. ROAP 21 ASY; Task 107, 1BB034, 68-03-0272.

Descriptors: Combined sewers, Design, Overflows, *Waste water treatment, *Storm drains.
Identifiers: Combined sewer overflow, *Combined sewer regulators, *Helical flow, Secondary motion, Combined sewer overflow treatment.

A design procedure and method to calculate settleable solids retention efficiency has been prepared for a combined sewer overflow regulator, using the principle of developing helical flow in an enlarged, curved extension of a sewer. A curved side overflow weir is used to draw off the clarified combined sewer overflow. Hydraulic and mathematical model studies were used in developing the helical flow concept and the design procedure. The reports of each model study are included. The helical bend principle was originally investigated by Dr. Prus-Chacinski of London, England. A second generation regulator was constructed in 1971 in Nantwich, England. The present study modified the design to conform to American wastewater conditions and practices. The helical bend combined sewer overflow regulator is capable of higher removal efficiencies with less hydraulic head loss than the swirl concentrator regulator, although the overall length of the helical unit appears to make it more expensive than the swirl concentrator. The helical bend regulator requires the use of only a mechanical outlet gate and cleaning facilities; otherwise it is essentially non-mechanical. (EPA)

SLUDGE DEWATERING,
C. H. Cox.
U.S. Patent No. 3,938,434, 14 p, 37 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1137, February 17, 1976.

Descriptors: *Patents, *Waste water treatment, *Sludge treatment, *Sludge disposal, Water pollution treatment, Water pollution control, Filtration, *Dewatering, Separation techniques, Filters.
Identifiers: Vacuum filters.

Filtration and dewatering of sludge and other slurry is carried out with an apparatus employing continuous filter-dewatering-expression under vacuum-compression. The apparatus consists of a flow-impeding structure and a combination sludge compression and dewatered solids discharge screw conveyor. The flow-impeding structure consists of an initial cylindrical portion, a following frustoconical portion, and a terminal cylindrical portion and is the filter-dewatering medium. It is formed of either a series of hoops or rings separated and closely spaced, held rigid by a frame; a continuous wire, semicircular in cross section, closely wound into a coil, held rigid by a frame; or a perforated screen held rigid by a frame. The rotating helical blades of the screw conveyor compress and squeeze liquid from the sludge within the structure through which the liquid escapes, and the screw conveyor discharges the dewatered solids out the end. An imperforate filtrate or liquid collection housing surrounds the structure, and a vacuum pump is connected to the filtrate housing. A coil-spring wiping or cleaning blade is positioned on the outside edge of the screw conveyor helical blade to provide continuous contact between the wiping or cleaning blade and the inside surface of the filtering-dewatering medium. A series of cleaning nozzles that project out radially from the outer edge of the helical blades are spaced to discharge, under pressure, a forceful blast of air, steam or water to dislodge material and keep the filter-dewatering medium clean and open. (Sinha-OEIS)
W76-07434

SEWAGE TREATMENT PROCESS,
W. J. Bauer.
U.S. Patent No. 3,939,066, 4 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1342-1343, February 17, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Water purification, Pressure, Mixing, Turbulence, Biological treatment, Activated sludge, Suspended solids.

Sewage is caused to flow through a hydraulic system which subjects the sewage to a sudden substantial drop in pressure, along with an attendant increase in velocity, and violent turbulence or agitation. The pressure may be decreased on the order of 20 psi in 1/10 second or less, and the sewage may be subjected to turbulent flow while under a vacuum. The resulting material evidences a marked increase in the amount of suspended solids. The sudden pressure drop and violent turbulence causes comminution of the solids particles into many smaller particles and thorough mixing, resulting in homogenization of the particles in the sewage. The resultant sewage material then may be subjected to bacterial adsorption and ingestion, or biological treatment. The production of many smaller particles results in a greatly increased total surface area of solids particles for exposure to the action of natural bacteria. The bacteria and associated adsorbed particles are then settled or otherwise separated from the remainder of the sewage mixture and removed as sewage sludge. The remaining effluent has a greatly reduced quantity of organic waste materials in it. The sludge may be kept in an aerobic condition by addition or air or oxygen so that the metabolism of the bacteria and the associated consumption of the attached organic wastes by these bacteria will proceed at a rapid rate. A portion of this sludge may be recycled back into the system. (Sinha-OEIS)
W76-07435

METHOD AND APPARATUS FOR TREATING SEWAGE,
Gypsum Industries Ltd., Transvaal (South Africa). (Assignee).
P. H. Huisman.
U.S. Patent No. 3,939,067, 3 p, 3 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1343, February 17, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Water pollution control, Water quality control, *Activated sludge, Aeration, Recycling, Denitrification, Application equipment.

A method of treating sewage uses the activated sludge process. Sewage is introduced into a circular aeration chamber. A spiral motion about the chamber center causes liquid-borne sludge from the chamber to flow along a canal around the chamber and returns at least part of the liquid-borne sludge in the canal back into the aeration chamber under the influence of gravity for recirculation. Apparatus suitable for use in this treatment comprises a tank having a central aeration chamber and a canal around it, an overflow weir from the chamber into the canal, a deflecting wall in the canal co-operating with an underflow weir from the canal to the chamber and an outlet from the canal adjacent the deflecting wall upstream. Further features provide for the overflow and underflow weirs to be located adjacent one another, for the floor of the canal to slope downward from the deflecting wall to the underflow weir, for the deflecting wall to be displaced progressively towards the aeration chamber center over the length of the canal having the inclined bottom, and for the aeration chamber to have a base in the form of an endless channel of arcuate cross-section. (Sinha-OEIS)

W76-07436

METHOD AND INSTALLATION FOR THE TREATMENT OF WASTE WATER TO FORM USEFUL WATER,
Schweizerische Luftverkehr A.G., Zurich (Switzerland).
H. Roth.
U.S. Patent No. 3,939,070, 3 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1344, February 17, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water purification, *Water pollution treatment, Water quality control, Flocculation, Chemical reactions, Reverse osmosis, Filtration, Potable water, Separation techniques, Membrane processes, Flotation.
Identifiers: Electro-flotation.

A method is provided for treating waste water which is accumulated due to industrial operations which also contains sludge and emulsified constituents, so as to form useful or consumable water. First a flocculation treatment is carried out in which there is added to the buffered waste water a flocculation agent or flocculant, preferably metallic salts, such as iron chloride, iron sulfate or aluminum sulfate, which throughout certain pH-ranges form flaky or flocculent precipitants. The separation of the suspended substances or particles can occur in conventional manner by electro-flotation, if necessary with the aid of collectors or accumulators and foamers. There is thus employed electro-flotation wherein the gas bubbles are produced at the turbid portions of the waste water by electrolysis. Then the clarified water from the flotation process is delivered through the agency of a safety filter directly to the reverse osmosis filtration. It is preferable that the clarified water which is further purified by reverse osmosis, be purified through the use of wound cellulose acetate modules arranged in pressure pipes or tubes. (Sinha-OEIS)
W76-07438

APPARATUS FOR GENERATING AN OXIDIZING REAGENT FOR THE TREATMENT OF POLLUTED WATER,
Air Liquide Societe Anonyme pour et l'Exploitation des Procedes, Paris (France). (Assignee).
E. J. LaForte.
U.S. Patent No. 3,939,072, 4 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 943, No 3, p 1344, February 17, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Waste water treatment, *Water pollution treatment, Water pollution control, Water quality control, Disinfection, Environmental sanitation, Oxidation, Chemical reactions.
Identifiers: Monoperoxysulphuric acid.

A process and apparatus for generating an oxidizing reagent for the treatment of polluted water is described. The monoperoxysulphuric anion is used for detoxification by oxidation of impurities contained in industrial waste water or for disinfection of water in reservoirs etc. However the monoperoxysulphuric anion found in relatively stable forms also have secondary pollution effects such as those caused by the NH4+ ion. The apparatus of this invention generates monoperoxysulphuric acid from hydrogen peroxide and sulphuric acid and is instantaneous at the moment of use before decomposition in a quantity just sufficient to achieve the desired effect and which permits the medium to be treated to be kept at a suitable pH value in order that the treatment be carried out. Hydrogen peroxide in the form of an aqueous solution with a concentration ranging from 35 to 100 percent and either concentrated sulphuric acid or fuming sulphuric acid are added simultaneously in a reaction vessel. The temperature of the reaction is maintained in the range -10 deg C to +80 deg C and the supply of the hydrogen peroxide and sulphuric acid to the reaction vessel is controlled so that the generation of the monoperoxysulphuric acid occurs when required and the quantity produced is adjusted according to the quantity required for the reaction. (Sinha-OEIS)

W76-07440

TREATING WASTE WATER CONTAINING NITRILES AND CYANIDES,
Sumitomo Heavy Industries, Ltd., Tokyo (Japan). (Assignee).
A. Kato, and K. Yamamura.
U.S. Patent No. 3,940,332, 4 p, 2 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1808, February 24, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution control, Water quality control, Water pollution treatment, *Activated sludge, Water purification, Microbial degradation, Microorganisms, Nitrogen compounds.
Identifiers: Nocardia, *Cyanides, *Nitriles.

A waste water effluent containing nitriles and cyanides is treated by passing through an acclimated, activated sludge containing a microorganism capable of degrading nitriles and cyanides. The microorganism is selected from the genus Nocardia. The strain Nocardia rubropertincta (ATCC 21930) acts to purify the waste water effluent. The waste water effluent containing 50 ppm to 250 ppm of nitriles and 10 to 50 ppm of cyanide and 500 to 2,000 ppm of COD (Potassium Dichromate Method) can be purified with a high efficiency. (Sinha-OEIS)
W76-07443

PROCESS FOR PHYSICALLY AND BIOLOGICALLY PURIFYING SEWAGE,
A. Schreiber, B. Schreiber, and E. Schreiber.
U.S. Patent No. 3,940,333, 6 p, 4 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1808-1809, February 24, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution control, Water quality control, Water pollution treatment, *Filtration, Water purification, *Biological treatment, Trickling filters, Aeration, Microorganisms.
Identifiers: Biofilters.

A process for physically and biologically purifying sewage uses a combination filter-biofilter containing a bed of artificially aerated filler material. The sewage is preliminarily clarified and distributed evenly over the filler material and is caused to flow through it for a limited time until the sewage has coated the surfaces of the filler material with sludge and microorganisms to an extent that the passage of air through the filler bed is substantially decreased because of encrustation of the interstices of the filler material. At this point the flow of sewage through the filler material is halted and the bulk of the sludge is removed by turning the filler material over with air. Then, the flow of sewage through the filler material is reinstituted. An abrasion resistent filler material is used and for purposes of turning-over the filler material, the bed is filled with water and the water and the filler material are turned over within the filter-biofilter by means of blown-in compressed air. At the same time the released sludge is drawn off. The turning-over of the filler material and water are accomplished gradually in a horizontal direction through the contents of the filter-biofilter. (Sinha-OEIS)
W76-07444

METHOD FOR SEPARATING OIL FROM WATER,
Kababa Industry Co. Ltd., Tokyo (Japan); and Mitsubishi Industries Ltd., Tokyo (Japan); and Chemical (E. C.) Industries Co. Ltd., Osaka (Japan).
T. Miyazawa.
U.S. Patent No. 3,940,334, 5 p, 1 fig, 2 tab, 10 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1809, February 24, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water purification, *Water pollution control, Water quality control, Water pollution treatment, *Separation techniques, *Oil wastes, Lipids, Organic compounds, Solvents, Coagulation, Skimming, Water reuse.
Identifiers: Paraffinic hydrocarbons.

A highly efficient process for the separation of oil from water in waste water treatment is provided. Paraffinic hydrocarbons with a specific gravity of less than 0.8 are added as extractive solvents to waste water containing fats and oils, together with inorganic or organic coagulants. This mixture is then stirred and allowed to stand; the floating oil-containing scum is then removed so as to eliminate the fats and oils from the waste water, and the resulting treated water may be re-used as process water in the plant or discharged into rivers or sewage lines. The oil-containing scum removed from the waste water is distilled so as to separate the paraffinic hydrocarbons, namely the fats and oils extraction solvents, from the mixture. The distillation vapor is then condensed to recover the paraffinic hydrocarbons and the remaining residue is, after filtration, incinerated or discarded. (Sinha-OEIS)
W76-07445

HORIZONTAL FLOW CLARIFIER,
Ecodyne Corp., Lincolnshire, Ill. (Assignee).
H. D. Robinson.
U.S. Patent No. 3,940,337, 4 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 943, No 4, p 1809-1810, February 24, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water purification, Water pollution control, Water quality control, *Water pollution treatment, Settling basins, Separation techniques, Suspended solids, Flow separation.
Identifiers: *Clarifiers.

A clarifier purifies liquids containing solids or contaminants. The liquid enters the clarifier and is directed into a primary sludge contact zone where it is mixed with recirculating sludge. Liquid from the primary sludge contact zone is pumped via flumes to the entrance of a settling corridor for horizontal flow. The liquid flows through the corridor forming an upper free-fall zone and a lower sludge zone as the precipitates settle out. As the liquid reaches the settling corridor exit, it approaches a point of positive separation of the clarified liquid above from the sludge stream below, which is formed by the kinetic capture of precipitates settling from the free-fall zone into the sludge zone of increasing velocity. The clarified liquid and the sludge stream enter a separation zone where they are caused to contact a vertical flow directing partition wall causing the sludge stream, of higher velocity, to pass under back into the primary contact zone and the clarified liquid, of lower velocity, to pass over to be boosted through flumes into a secondary settling basin for polishing. Polished liquid then flows over weirs to the outlet while the sludge collected in the basin is directed to the entrance of the settling corridor. (Sinha-OEIS)

SANITARY-HELMINTHOLOGIC ASSESSMENT OF IRRIGATION WITH SEWAGE BY MEANS OF SPRINKLING, (IN RUSSIAN),
N. I. Khizhnyak.
Gig Sanit 38(3), p 104-105, 1973.

Descriptors: Irrigation, *Sewage disposal, *Waste disposal, Crops, *Waste water disposal, Public health.
Identifiers: *Helminthologic assessments, Mangel-wurzel.

Sanitary-helminthological assessment of irrigation with sewage was studied in experimental portions of 4 collective farms. Cucumbers, tomatoes, cabbage, mangel-wurzel and perennial grasses were cultivated. After irrigation, 10-30 helminth eggs/kg were found in surface soil of 1 collective farm; 5-12/kg at a depth of 10 cm and 0-8 at a depth of 20 cm. Cucumbers from that farm contained up to 4-5 helminth eggs/kg; tomatoes, 1-2 and cabbage, 2-3. Cultivation of cabbage in irrigated fields should be prohibited. Annual and perennial grasses, grains and fodder may be grown safely. Only completely dehelminthized sewage should be used in watering of crops by the sprinkling method.--Copyright 1975, Biological Abstracts, Inc.
W76-06983

PORTOBELLO LONG SEA SEWAGE OUTFALL TUNNEL,
Tunnels and Tunnelling, Vol. 7, No. 6, p 23-24, November/December, 1975.

Descriptors: *Sewers, *Tunnels, *Tunneling, *Outfalls, Construction, Sewage disposal, Grouting.
Identifiers: *Chalk.

Problems in the construction of a sea sewage outfall tunnel beneath the English Channel at Portobello have been caused by the upper chalk material in the path of the tunnel. Chalk has been encountered in three different conditions: highly fissured chalk underneath the foreshore, where fissures were either open and water bearing or full of soft putty chalk; good sound material with open fissures; or (presently encountered) highly fractured chalk with putty and virtually no strength. Due to the low strength of the chalk, stronger linings with bolt cast iron lining rings were required. In the final section of the tunnel, to be completed in 1976, driving must be preceded by extensive ground treatment. It was found that the critical factor in ground treatment is the interval at which probes are drilled.In highly fissured material an alternating pattern of four probes drilled to a 13 m length every 3 m of tunnel advance was necessary. It was also determined that several fissures could be grouted simultaneously through the same hole. Rapid hardening grout was used to reduce delay times. (Kramer-FIRL)
W76-06986

INCINERATOR AND SYSTEM FOR CLEANING PRODUCTS OF COMBUSTION,
K. D. Brown.
United States Patent 3,911,836. Issued October 14, 1975. Official Gazette of the United States Patent Office, Vol. 939, No. 2, p 677, October, 1975.

Descriptors: *Incineration, *Waste disposal, *Sewage treatment, *Cleaning, *Patents, Equipment, Pumps, Burning.

An incinerator and combustion product cleaning system for burning sewage has been patented. A preheating chamber heats and partially dries the moist waste to be burned. Waste is supplied to the preheating chamber and passes by a conveyor to a combustion chamber. Blowers supply air to the combustion chamber. A liquid vortex type vacuum pump is used to withdraw gaseous matter from both chambers and to clean the withdrawn gas. (Kramer-FIRL)
W76-06991

IMPROVING QUALITY OF LEACHATE FROM SANITARY LANDFILLS.
French Patent FR 2256-114. Issued August 29, 1975. Derwent French Patents Abstracts, Vol. W, No. 42, p D3, November, 1975.

Descriptors: *Patents, *Water quality control, *Leachate, *Landfills, Waste disposal, Cements, Metals.

A patent has been issued for a process for improving quality of leachates from sanitary landfills. Waste material is treated by mixing it with an aqueous solution of an alkali metal silicate and silicate settling agent containing polyvalent metal ions. This converts the mixture into a consolidated, chemically and physically stable earth-like material, substantially insoluble in water. Its pollutants are entrapped in the soldified silicate. The landfill material and treated waste material are disposed of in contact with each other so that the leachate will trickle down through the treated waste material. A frequently used setting agent is Portland cement. (Kramer-FIRL)

LAND AND SEA SOLIDS MANAGEMENT ALTERNATIVES IN PHILADELPHIA,
Philadelphia Water Dept. Pa.
C. F. Guarino, M. D. Nelson, S. A. Townsend, T. E. Wilson, and E. F. Ballotti.
Journal Water Pollution Control Federation, Vol. 47, No. 11, p 2551-2564, November, 1975. 7 fig, 9 tab.

Descriptors: *Waste disposal, *Sludge disposal, *Waste water treatment, Pennsylvania, Costs, Oceans, Delaware River, Irrigation, Environmental effects, Solid wastes, Ultimate disposal.
Identifiers: *Land application, Ocean dispersal.

A study was performed for the city of Philadelphia, Pennsylvania, comparing land application with ocean disposal of waste water solids. Since May 1973, Philadelphia has disposed of its digested sludge at a sea dispersal site 50 nautical miles from the mouth of the Delaware River. The city's three waste water treatment facilities handle a total of 447 mgd. Alternatives for solids disposal were detailed. Sea disposal methods included: dispersing thickened digested solids 11.5 nautical miles from Cape May, New Jersey (practiced from May 1961 unti May 1973 when the EPA moved the site); dispersing unthickened digested solids at that location; or dispersing unthickened digested solids at a point 50 nautical miles from Cape May. Land application alternatives were: dispersing liquid sludge by sprinkler irrigation, plow-in technique or tanker application; dispersing sludge cake by trenching, land filling or spreading and incorporating; or by composting. After considerations of costs, environmental effects, and operational simplicity, it was concluded that ocean dispersal should be continued for solids management in Philadelphia. (Kramer-FIRL)

SEWERAGE AND SEWAGE DISPOSAL,
I. D. Kirkaldy.
Chartered Municipal Engineer, Vol. 102, No. 11, p 219-221, November, 1975.

Descriptors: *Sewerage, *Sewage disposal, *Sewage, *Disposal, *Waste water disposal, History, Treatment facilities, Financing, Automation, *Waste water treatment.
Identifiers: Water authorities, Great Britain, South Hampshire(Great Britain).

A historical review of sewerage and sewage disposal is presented. Legislation governing the disposal of wastes to rivers near cities has been passed since the fourteenth century in Britain. Commissions appointed in the last century to study river pollution came out in favor of land disposal or irrigation as a possible use of wastes. Prior to the recent reorganization, sewerage and sewage disposal was administered by almost 1400 authorities. Even after reorganization, a split existed between sewerage and sewage disposal. Confusion has been caused by the difference in the methods of finance brought about by reorganization. Water authorities are also experiencing difficulties in obtaining realistic figures from local authorities on current schemes. There is much speculation on the continuing role of district councils as agents for the water authority in sewerage matters. Advantages of the reorganization can not be determined in the short term. Time and effort is involved but eventually a more rational system will evolve. The aim should be the consideration of regionalization of treatment facilities where possible. Proposals for the South Hampshire main drainage project are considered in this light. The final scheme was adopted after much investigation and deliberation. For new disposal works, the cost of automation should be weighed against the rise in labor costs. Precise knowledge of all of the interrelations of parameters in sewage treatment processes is lacking, and complete automation should be avoided. Sludge incineration and dewatering systems on the continent should be investigated. (Pinto-FIRL)

THE MEANING OF ULTIMATE DISPOSAL,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. B. Dean.
In: Complete WateReuse: Industry's Opportunity, April 23-27, 1973, American Institute of Chemical Engineers and Environmental Protection Agency--Technology Transfer, p 135-139.

Descriptors: *Ultimate disposal, *Water reuse, *Water utilization, *Waste water disposal, *Waste disposal, Industrial wastes, Waste storage, Storage, Disposal, Costs.
Identifiers: Volume reduction.

The reuse and ultimate disposal of industrial waste waters are discussed. Industrial waste waters can be discharged after suitable purification; they can be evaporated; or they can be purified and reused. Reuse means eventually all dissolved or suspended materials must be accounted for. Those that can not be thrown away, given away, or sold must be stored somewhere. Careful housekeeping can eliminate some and reduce many other wastes. Wastes that are necessary by-products will accumulate in quantities that cannot be further reduced by any waste control program. Removing water minimizes the volume of the waste to be stored, but the cost of drying must be balanced against the reduced cost of storage. Wastes can be converted to useful products only if the cost of conversion can be justified by the market value of the products. Careful segregation of waste streams can reduce the cost of treatment and disposal substantially, and may permit profitable recovery of some of the toxic wastes. (See also W76-05314) (Pinto-FIRL)

OVERVIEW OF SLUDGE HANDLING AND DISPOSAL,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. B. Farrell.
In: Research Symposium on Pretreatment and Ultimate Disposal of Wastewater Solids, May 21-22, 1974, New Brunswick, New Jersey, Rutgers University, p 1-22. 3 fig. 3 tab, 10 ref.

Descriptors: *Sludge, *Sludge disposal, Waste water treatment, Dewatering, Municipal wastes, Filtration, Centrifugation, Heat treatment, Ultimate disposal, Oceans, Landfill, Incineration, Stabilization, Waste treatment.
Identifiers: Sludge conditioning, Ocean disposal, Co-incineration, Co-pyrolysis, Filter cake, Gravity thickening, Air flotation.

An overview of the sludge handling and disposal research performed by the Ultimate Disposal Section of the U.S. Environmental Protection Agency's National Environmental Research Center in Cincinnati, Ohio, is presented. An objective of this group has been to advance the technology for processing and disposing of the concentrates from municipal and advanced waste water treatment processes. Recent developments in treatment and disposal operations are considered. Before dewatering, sludges must be thickened as much as possible. Gravity and air flotation thickeners are most commonly used. Recent developments in stabilization processes include anaerobic or aerobic thermophilic digestion. These processes combine stabilization and pasteurization into one step and cost reductions can result. Filtration and centrifugation are the most commonly used methods of dewatering. Newer methods include filter presses, vertical presses and belt filters. These methods are good for making high cake solids. Before filtering, sludges must be conditioned. The most effective means besides additives is heat treatment. Sludge disposal is becoming the largest problem in waste

over processing. Conventional methods include ocean disposal, landspreading, landfill and incineration. Ocean disposal and incineration do not face promising futures because of the other types of pollution they can cause; land application and landfill are subject to guidelines and available sites. Promising areas for the future include co-incineration and co-pyrolysis of sludge with solid waste. (See also W76-05079) (Pinto-FIRL)

THERMAL DEGRADATION OF SLUDGES,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. A. Olexsey.
In: Research Symposium on Pretreatment and Ultimate Disposal of Wastewater Solids, May 21-22, 1974, New Brunswick, New Jersey, Rutgers University, p 127-196. 16 fig, 8 tab, 69 ref.

Descriptors: *Heat, *Degradation(Decomposition), *Sludge treatment, *Sewage sludge, Sludge disposal, Incineration, Organic matter, Ultimate disposal, Economics, United States, Waste treatment.
Identifiers: Land disposal, On-site disposal, Pyrolysis, Multiple hearth, Thermal processing, Fluidized bed, Wet oxidation.

Although land disposal of sewage sludge remains the most common method of application, there are increasing pressures to employ on-site reduction and disposal methods. Alternate techniques in the form of thermal processing or thermal degradation are discussed. Analysis of some sludge properties shows that sludge is mostly water, is inclined to retain the water, is difficult to handle and odorous, has 30% nonvolatile materials or solids, and is corrosive to equipment. Incineration, despite its drawbacks, is the most attractive alternative. Different types of incinerators are discussed. The multiple hearth sludge incinerator is the most popular in the United States. In the three operating zones the sludge is dried, burned and then cooled. Volume reduction in the 90% range is typical. The fluidized bed is the second most popular method in the United States. A bed of inert materials capable of oxidizing organic solids is used in this design. This method is simple to operate. Other less widely applied methods of incineration include the flash drier-incinerator, the rotary kiln, and the cyclone furnace. Three commodities go into a sludge disposal system: money, sludge and fuel. Two main products are ash and gas emissions. Incineration as compared to land application of sludge is costly, fuel consuming, and can contribute to air pollution. Other methods of on-site disposal are being investigated that will minimize these disadvantages, including pyrolysis, combined incineration with sludge waste, and wet oxidation. W76-07242

THICKENING CHARACTERISTICS OF ALUMINUM AND IRON PRIMARY SEWAGE SLUDGES,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
S. W. Hathaway, and J. B. Farrell.
In: Research Symposium on Pretreatment and Ultimate Disposal of Wastewater Solids, May 21-22, 1974, New Brunswick, New Jersey, Rutgers University, p 197-235. 6 fig, 10 tab, 7 ref.

Descriptors: *Sewage sludge, *Aluminum, *Iron, Salts, Chemical precipitation, Sludge, Phosphates, Filtration, Gravity, *Sludge treatment, Treatment facilities, Waste treatment, Economics, Dewatering, Equipment, Effluents, Polymers.
Identifiers: *Thickening characteristics, Primary sewage sludges, Phosphate removal, Gravity thickening, Air flotation, Thickening rates, Alum, Polymer conditioning.

Phosphate removal in sludge is usually accompanied by the precipitation of metallic salts such as aluminum and iron. Thickening characteristics of Al-primary and Fe-primary sludges by means of standard gravity thickening and air flotation measurements are defined. Since sludge characteristics change even within a certain treatment facility, duplicate treatment units were set up to standardize measurements. Sludges were treated with either alum or ferric chloride. These sludges were very homogeneous mixtures while the conventional primary sludge was fibrous and lumpy. Results showed that Al-primary and Fe-primary sludges do not gravity thicken as well as conventional primary sludges. They only thicken to about 4-5% solids. Dilution with effluent or polymer conditioning can greatly improve thickening rates. Air flotation has shown to be a satisfactory means of thickening Al and Fe-primary sludges but is not as effective with conventional primary sludge. Polymer addition improves performance. There is a need for a more comprehensive screening to uncover polymers that may produce higher solids contents at higher thickening rates. Al and Fe-primary sludges can be filtered at reasonable rates, as long as the solids content is above 4%. This solids content can be achieved by gravity or flotation thickening. Subsequent dewatering steps are thus practicable and capital costs for equipment are not excessive. (See also W76-05079) (Pinto-FIRL)

FUTURE PROBLEMS IN SLUDGE PRODUCTION AND HANDLING SYSTEMS,
J. V. Hunter.
In: Research Symposium on Pretreatment and Ultimate Disposal of Wastewater Solids, May 21-22, 1974, New Brunswick, New Jersey, Rutgers University, p 267-281. 11 ref.

Descriptors: *Sludge, *Waste water treatment, Sludge treatment, Lime, Salts, Iron, Aluminum, *Coagulation, Phosphates, Sludge digestion, Anaerobic digestion, Inorganic compounds, Alkalinity, *Chemical precipitation.
Identifiers: Ferric chloride, Alum, Phosphate removal, Sludge handling, Particulate matter.

Ferric salts, alum or lime can be used in waste water treatment in two ways: as a coagulant for the removal of particulate materials; or as a precipitant in phosphate removal processes. Inorganic compounds will result. Modifications and problems in present sludge treatment and handling processes that might be expected from their employment are indicated. The composition, production, water holding capacities, and digestion of the sludge and the regeneration and recovery of the precipitants and coagulants are studied. Results show that the total dry weight of the sludges increases with the use of alum, ferric chloride or lime as precipitants or coagulants. In the case of a lime sludge, there is no change of volume after addition of the coagulant or precipitant. The inorganic contents of these sludges are higher and the composition is fairly predictable from a knowledge of the reactions involved and the amounts of particulates and phosphates removed. Anaerobic digestion may be adversely affected but there are other treatment and disposal methods available so that this is not a significant disadvantage. Lime sludges and alum sludges can be reprocessed to recover the precipitants. Alkaline regeneration results in a low quality coagulant. (See also W76-05079) (Pinto-FIRL)

BLOOMINGTON GOES SOLID-STATE,
Orr-Schelen-Mayeron and Associates, Minneapolis, Minn.
E. H. Anderson.
Water and Wastes Engineering, Vol. 12, No. 11, p 64-66, November, 1975. 2 fig.

Descriptors: *Automation, *Control systems, *Waste water treatment, *Sewers, *Water treatment, Computers, Treatment facilities, Construction, Equipment, Design criteria, Minnesota.

An automatic control system for the Bloomington, Minnesota, water treatment plant is described. Designed in 1972, the facility is equipped with a solid-state electronic control panel with three merchandized graphics to control storage reservoir levels, water distribution system pressures, remote pumping stations and local deep wells. In addition to these functions, the control system monitors the city's 16 sanitary sewers and 3 storm sewer lift stations. Warnings are provided for high wet and dry wells, power failures, transmission line failures, and vandalism. The facility is close to a residential area and noise levels outside the building have been kept quite low with the elimination of air compressors to produce carbon dioxide and with the installation of sound-absorbent materials around pumping areas. THROUGHFLOW MEASUREMENTS IN WATER AND WASTE WATER TECHNOLOGY (DURCHFLUSSMESSUNG IN DER WASSER- UND ABWASSERTECHNIK).
Wasser Luft und Betrieb, Vol. 19, No. 9, p 514-517, September, 1975. 10 fig.

Descriptors: *Instrumentation, *Measurement, *Flow, *Waste water treatment, *Water treatment, Equipment, Pressure, Pipelines, Venturi meters, Ultrasonics, Flowmeters, Flow measurements, Canals.

Methods and instruments used for flow measurement in open canals, and in nonpressure and pressure pipes are described. Venturi sections are commonly used for measurement in open canals and in nonpressure lines; other methods and instruments are also available for measurement in pressure lines. These include measuring orifices, venturi tubes, and devices adopting the principle of differential pressure measurement. Automatic counters permit the measurement of the instantaneous throughflow, the integration of the volume, and the transmission of the measurement values. Inductive flowmeters are suitable for measurement without pressure loss in media with a minimum conductivity of 0.05 microS/cm. Ultrasonic measurement is possible in existing pipelines with a minimum nominal diameter of 300 mm. (Takacs-FIRL)

CALCULATE CHEMICAL ADDITIVE FEED RATES IN THREE STEPS,
Interpace Corp., Rochester, N.Y. Pulsafeeder Products.
W. V. Dwyer.
Pollution Engineering, Vol. 7, No. 11, p 40, November, 1975. 1 fig.

Descriptors: *Waste treatment, *Water treatment, *Chemical reactions, *Graphical methods, Mathematical studies, Flow rates, Operations.
Identifiers: *Nomographs, Chemical additive feed rates.

A simple nomograph is presented for calculating chemical dosage rates for water and waste treatment plant operations. The formula for the precise calculation of chemical additive feed rate is flow (expressed in mgd) times dosage of treatment chemicals (in ppm) all divided by the feed concentration percent multiplied by the specific gravity of the chemical additive. This figure is then multiplied by a factor of 4.17. Because equipment operation rates are based on different factors than the flow rates for the overall treatment process, this calculation is time-consuming. An illustration of a nomograph which reduces this calculation to three steps to calculate the required feed rate in gallons per hour for a waste stream is provided. (Kramer-FIRL)

FLUORIDATION ENGINEERING MANUAL,
Environmental Protection Agency, Washington, D. C. Div. of Water Supply.
E. Bellack.
Report EPA-520/9-74-022, 1974. 94 p, 19 fig, 6 tab, 55 ref, append.

Descriptors: *Water treatment, *Potable water, *Water works, *Fluoridation, Public health, Personnel, *Design criteria, *Treatment facilities, Equipment, Fluorides.

This manual on fluoridation engineering is designed to assist local and state engineers in designing fluoridation installations and water plant personnel in operating them. Emphasis is placed on the fact that the optimum concentrations have been determined by many studies involving millions of people, and should be adhered to. A deficiency of fluorine can lead to tooth decay, while an excess is the cause of dental fluorosis. The manual covers the following topics: compounds used in controlled fluoridation; feeders used for adding fluorides; preparation of fluoride solutions; selecting the optimal fluoridation system; control and surveillance; maintenance; safety and hazards in handling fluoride chemicals; and, technical problems attributed to fluoridation. No matter how well a fluoridation installation is designed, it is the water plant personnel who insure the successful operation. When planning a fluoridation installation, quantity of water pumped, economy, convenience, and location will affect the choise of chemical and equipment. (Orr-FIRL)

A MANUAL FOR THE EVALUATION OF A STATE DRINKING WATER SUPPLY PROGRAM,
Environmental Protection Agency, Washington, D.C. Div. of Water Supply.
Report EPA-430/9-74-009, December, 1974. 49 p, 6 tab, 13 ref, 3 append.

Descriptors: *Water supply, *Water quality control, *Water sources, *Potable water, Public health, Standards, Monitoring.
Identifiers: Water supply program evaluation.

This manual was written to serve as a guide for EPA regional personnel in evaluating State water supply programs, as a guide for States in evaluating their own programs, and, to provide sufficient criteria, standards, and guidelines for the development of a model State water supply program that will effectively regulate and insure a healthful and safe supply of drinking water to the public. The first section of the manual discusses the three major divisions of authority under which a State water supply program normally operates. These include legal statutes, administrative rules and regulations, and water supply program policy. The second section lists the activities which are necessary for an effective regulatory and surveillance program. This section also presents guidelines for competent and efficient performance of these activities. The third section provides guidelines for the evaluation of a State's drinking water supplies and discusses criteria for selecting a representative number of public water supplies for study, current assessment of water supply systems based on a field survey of existing conditions and/or examination of pertinent data recorded in State, county, or water utility files, and important sanitary features of a water supply system and their health significance. REMOVAL OF ORGANIC MATTER BY FLOC COLLOIDS ONTO SLUDGE PARTICLES,
Permutit-Boby Ltd., London (England).
A. I. Treanor.
Water Services, Vol. 79, No. 956, p 420-422, October, 1975. 4 fig.

Descriptors: *Organic matter, *Water treatment, *Flocculation, *Sludge, Salts, Natural streams, Fulvic acids, Humic acids, Chemical precipitation, Sludge treatment, Sedimentation, Filtration, Polyelectrolytes, Colloids, Coagulation, Zeta potential.
Identifiers: Permutit-Boby Precipitator, Floc colloids, Aging process, Mineral content.

Nearly all natural waters contain varying types and amounts of organic matter. Removal by the coagulation process depends on the nature of the organic substance, the mineral content of the water and the chemical characteristics of the coagulant. Organic substances found in water are either fulvic acid or humic acid materials. These generally have negative charges and in order for coagulation to take place, the charge must be reduced. This charge, or zeta potential, may be reduced by adding a mineral salt, such as aluminum sulfate, ferric sulfate, ferric chloride or chlorinated ferrous sulfate. After coagulation, flocculation, sedimentation or filtration may be necessary for removal of organic matter. Flocculation is accomplished by gentle agitation of the water so that the floc colloids can collide and aggregate into floc particles. There is a size limitation to this process, but after an aging process, causing contraction of the particles, increased densty and resistance to shear, they are considered as sludge particles and can combine with unaged floc colloids. They then can grow to a large enough size so that sedimentation or filtration can take place. In this process it is important that just the right amount of coagulant be added so that aging does not take place too quickly and the design of the clarifier must be such that sludge particles combine only with unaged floc colloids. A polyelectrolyte can be employed to increase settling rate and plant throughput. This is used in the Permutit-Boby Precipitator. This addition simplifies the flocculation stage and the aging process and segregates sludge growth from the coagulation process. (Pinto-FIRL)

TECHNIQUES FOR DISPERSING AND DISSOLVING OZONE IN WATER/PART I,
Compagnie Intercommunale Bruxelloise des Eaux (Belgium).
W. Massachelein, G. Fransolet, and J. Genot.
Water and Sewage Works, Vol. 122, No. 12, p 57-60, December, 1975. 5 fig, 4 tab.

Descriptors: *Water treatment, *Ozone, Kinetics, Disinfection, Aeration, Microorganisms, Performance, Dispersion.
Identifiers: Ozone residuals.

Selection of a contacting system for water injection of ozone was discussed. Experiments showed that treatment using circulating water was more efficient than a batch treatment technique. The rate of disinfection by ozone depends upon both the action of residual concentrations and on the action of contact between an 'ozone bubble' and the microorganisms. Both effects should influence the choise of system. Ozone-bubble contact should be promoted by appropriate mixing conditions while gas stripping is to be avoided during a sufficient period of quiescent action of residual ozone dissolved in the water. As Part I of a continuing article, this paper compared and evaluated several ozone-contacting systems, including hydrostatic injection with porous pipes, total injector, Vortex propeller, water recirculating propeller, air dispersing impeller, and liquid-circulating aeration impeller systems. SIMULATION OF LEAD REMOVAL BY CHEMICAL TREATMENT,
Knouse Foods Cooperative, Peach Glen, Pa.
L. M. Naylor, and R. R. Dague.
American Water Works Association Journal, Vol. 67, No. 10, p 560-565, October, 1975. 8 fig, 18 ref.

Descriptors: *Lead, *Model studies, *Lime, *Coagulation, *Water treatment, Surface waters, Analytical techniques, Alkalinity, Hydrogen ion concentration, Laboratory tests, Storm runoff.
Identifiers: *Chemical treatment.

Lead enters surface waters as a result of air scrubbing by rain and snowfall, from urban land runoff, from the exhaust of power boats, and from waste water effluents. In this study, the fate of lead in surface waters and the effectiveness of three water treatment processes in lead removal were considered. On a laboratory scale, alum coagulation, lime, and lime-soda ash softening were evaluated. The chemical softening process was evaluated with both conventional and solids-contact modes of operation. Results of the laboratory tests showed that the solids-contact method removed nearly all the lead over a wide range of contact solids concentrations. The conventional chemical softening is effective for lead removal in a pH range of of 9.2 to 10.4. Coagulation and flocculation with alum resulted in lead removal at pH levels of 8 to 9 but not near neutral values. The solubility of lead in surface waters is limited primarily by alkalinity and pH. (Kramer-FIRL)
W76-07041

THE PHYSICAL METHOD OF WATER STERILIZATION,
W. Summer.
Process Biochemistry, Vol. 10, No. 9, p 43-46, November, 1975. 3 fig, 6 tab.

Descriptors: *Water treatment, *Ozone, *Ultraviolet irradiation, Design criteria, Equip-

ment, *Waste water treatment, Water supply, Kinetics, Potable water.
Identifiers: Emergency water supplies.

Physical methods of water sterilization have been proposed to produce potable water supplies from heavily contaminated water, particularly in emergency situations. Two methods described were ultra-violet irradation and ozonation. The design of ultra-violet water treatment equipment was detailed. Ultra-violet energy at bactericidal wavelengths cannot achieve direct oxidation of organic contaminants suspended in a liquid. For this purpose, ozone is used effectively, rather than a chemical oxidant such as chlorine. If ozone is used as the oxidant in addition to uv sterilization, only small ozone quantities are required. The kinetics of ozone production for this purpose were outlined. The absorption of ozone in water as related to temperature and the usage of ozone as a bactericide in industrial water treatment were also discussed. (Kramer-FIRL)

ENVIRONMENTAL LAW- THE 1972 AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT EXTEND DREDGE AND FILL JURISDICTION ABOVE THE MEAN HIGH WATER LINE. UNITED STATES V. HOLLAND, 373 F. SUPP. 665 (MD FLA. 1974).
Rutgers-Camden Law Journal, Vol. 6, p. 823-41 (1975). 18 p.

Descriptors: *Federal Water Pollution Control Act, *Florida, *Water pollution control, *Navigable waters, *Non-navigable waters, Construction, Dikes, Navigation, Landfills, Pemits, Artificial watercourses, Discharge(Water), Conduits, Bayous, Fish, Wildlife, Recreation, High water mark, Wetlands, Judicial decisions.
Identifiers: *FWPCA Amendments of 1972, *Mean high water line, Tidal wetlands, Drainage ditches, Navigable servitude, Secondary discharge.

Until 1972 federal water pollution control had been limited to the regulation of activities affecting the nation's navigable waters. Then Congress amended the Water Pollution Control Act and redefined 'navigable waters' to mean 'waters of the United States.' In United States v. Holland, a district court held that the federal authority under the new definition extended to non-navigable waters and wetland areas above the mean high water line. In reaching its result the district court reviewed the legislative history to determine the extent of jurisdiction under the amendments, however, the court interpreted the policy of the amendments to be that 'the discharge of pollutants must be controlled at the source', and then applied a conduit theory to find the defendant landowner guilty of polluting Tampa Bay. The pollutant had been deposited in small canals, which then carried them into the bay. While the reasoning in Holland has been criticized for leaving many questions unanswered, the case will probably be cited for the propositions that navigability and the mean high water line no longer limit federal water pollution enforcement authority. (Segall-Florida)

Identifiers: *FWPCA Amendments of 1972, *National Pollution Discharge Elimination System.

Implementation of the Federal Water Pollution Control Act Amendments of 1972 will have adverse effects on State water pollution control efforts which may at least initially, outweigh the benefits to be gained by these amendments. The major benefit of the Amendments will be the uniform application of the law nationwide. This will eliminate threats by business to leave a state if the state attempts to enforce tough pollution control requirements. The Amendments allow states to operate the National Pollutant Discharge Elimination System (NPDES) under state law; however, a large amount of federal control is retained over these systems. States must go through a lengthy and complex bureaucratic process to obtain approval for their programs. Delays in approving these state programs will cause a problem in meeting the deadlines of the federal law and will also cause problems for waste dischargers who may become confused as to who is in charge of issuing permits. There are also problems with the technical standards of the Amendments in that they fail to vary treatment requirements for discharges to the ocean and discharges to fresh water. (Nursey-Florida)

ENVIRONMENTAL PROTECTION AGENCY - ELECTROPLATING POINT SOURCE CATEGORY (INTERIM STANDARDS).
Federal Register, Vol. 40, No. 80, 18130-39 (1975). 10 p, 9 tab.

Descriptors: *Water quality standards, *Industrial wastes, *Water pollution control, *Regulation, *Federal government, Standards, Legal aspects, Water law, Administration, Water pollution, Water pollution sources, Water quality control, Chemical wastes, Effluents, Pollutants, Technology, Environmental engineering, Waste disposal.
Identifiers: Administrative regulations, *Electroplating point sources.

The Environmental Protection Agency has amended the effluent guidelines and standards for the electroplating manufacturing point source category. The applicability of the standards is expanded to include cadmium, tin, lead, aluminum and iron. The regulation requires the achievement by not later than July 1, 1977 of effluent limitations for point sources which require the application of the best available technology economically achievable, and the achievement by new sources of a Federal standard for control of the discharge of pollutants which reflects the greatest degree of

effluent reduction achievable through the application of the best available control technology including, where practicable, a standard permitting no discharge of pollutants. (Nursey-Florida)
W76-06829

ENVIRONMENTAL PROTECTION AGENCY, ELECTROPLATING MANUFACTURING POINT SOURCE CATEGORY (STANDARDS OF PERFORMANCE FOR NEW SOURCES).
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol. 40, No. 80, 18140-48 (1975). 9 p, 20 tab.

Descriptors: *Classification, *Industrial wastes, *Federal Water Pollution Control Act, *Water pollution control, Water pollution, Waste water(Pollution), Water pollution treatment, Water pollution sources, Waste water disposal, Water quality, Water quality control, Regulation, Administrative agencies, Wastes, Effluents, Federal government, Administration.
Identifiers: Administrative regulations.

Pursuant to the Federal Water Pollution Control Act, the Environmental Protection Agency has proposed effluent limitations and guidelines for existing sources and standards of performance and pretreatment standards for new sources for the electroplating manufacturing point source category. The proposed guidelines achieve effluent limitations for point sources, other than publicly owned treatment works, by requiring the application of the best practicable control technology currently available. The subcategories of the electroplating manufacturing point source category included within this proposal and specifically regulated are: (1) electroplating of common metals; (2) electroplating of precious metals; (3) electroplating of specialty metals; (4) anodizing; (5) coatings; and (6) chemical etching and milling. This proposed regulation applies to users of publicly owned treatment works which fall within the description of the applicable point source category, but the pretreatment regulations apply to the introduction of pollutants which are directed into a publicly owned treatment works, rather than to discharges of pollutants to navigable waters. (Welch-Florida)
W76-06830

ENVIRONMENTAL PROTECTION AGENCY - SUGAR PROCESSING POINT SOURCE CATEGORY (INTERIM RULE).
40 Fed Reg 8498-8505 (1975). 8 p.

Descriptors: *Water quality standards, Standards, *Water pollution control, *Industrial wastes, *Regulation, *Classification, Legal aspects, Water law, Federal government, Administration, Water pollution, Pollutants, Effluents, Water pollution sources, Water quality control, Environmental engineering, Waste disposal, Technology.
Identifiers: *Administrative regulations, *Sugar processing.

The Environmental Protection Agency has amended effluent guidelines and standards for the sugar processing point source category. Effluent limitations and guidelines are established for the Louisiana, Florida, Texas, Hilo-Hamakua Coast, and Hawaii raw cane sugar processing subcategories. Existing point sources must achieve by not later than July 1, 1977, effluent limitations which require the application of the best practical control technology currently available. Existing point sources must achieve by not later than July 1, 1983 effluent limitations which require the application of best available technology economically achievable. New point sources must achieve a Federal standard for control of the discharge of pollutants which reflects the greatest degree of effluent reduction achievable through the application of the best available control technology including, where practicable, a standard permitting no discharge of pollutants. Identifiers: Administrative regulations.

Pursuant to the Federal Water Pollution Control Act, the Environmental Protection Agency (EPA) has set forth effluent limitations and guidelines for the Paint formulating point source category including both the oil-base and water-base subcategories. The Act requires achievement of effluent limitations for point sources, other than publicly owned treatment works, which require the application of the best available technology economically achievable which will result in eliminating the discharge of all pollutants. Disposal of the pollutants removed from waste waters in the paint industry in the form of solid wastes and liquid concentrates usually requires only minimal custodial care, but those constituents which may be hazardous should be removed to landfill sites where there can be no horizontal or vertical migration of those contaminants to ground or surface waters. FERTILIZER MANUFACTURING POINT SOURCE CATEGORY (EFFLUENT GUIDELINES AND LIMITATIONS).
Environmental Protection Agency, Washington, D.C.
Fed. Reg. Vol. 39 No. 195 p. 360093-36099, Oct. 7, 1974. 7 p.

Descriptors: *Water quality standards, *Classification, *Federal Water Pollution Control Act, *Fertilizers, *Discharge(Water), *Water quality control, Legal aspects, Regulation, Federal government, Water pollution, Pollutants, Water quality, Water pollution control, Water pollution abatement, Industrial wastes, Ammonium compounds, Sulfates, Economics, Economic impact, Technology, Water pollution sources, Organizations.
Identifiers: FWPCA Amendments of 1972.

The Environmental Protection Agency has given notice of proposed effluent limitations and guidelines for existing sources and standards of performance and pretreatment standards for new sources for the fertilizer manufacturing point source category. The proposed regulation will amend present regulations by adding to the fertilizer manufacturing point source category the ammonium sulfate subcategory and the mixed and blend fertilizer production subcategory. The regulation requires the achievement by July 1, 1977, of effluent limitations for point sources which require the application of the best practicable control technology available. The regulation also requires the achievement by July 1, 1983 of effluent limitations for point sources which require the application of the best available technology economically achievable which will result in progress toward the national goal of eliminating the discharge of all pollution. Finally, the regulation requires the achievement by new sources of a Federal standard for the control of discharge of pollutants which reflects the greatest degree of effluent reduction achievable through application of the best available control technology. REVIEW OF NPDES PERMITS.
Corps of Engineers, Washington, D.C.
Fed. Reg. Vol. 39 No. 191 p 35369-35373, Oct. 1, 1974. 5 p.

Descriptors: *Federal Water Pollution Control Act, Navigable waters, *Navigation, *Regulation, *Permits, Legal aspects, Federal government, Water law, Water quality, Water quality control, Water pollution, Water pollution sources, Water pollution effects, Water pollution abatement, Industrial wastes, Pollutants, Water utilization, Solid wastes, Water pollution control.
Identifiers: *FWPCA Amendments of 1972, *National Pollution Discharge Elimination System.

The Secretary of the Army has given notice of a proposed regulation prescribing the policy, practice and procedure to be followed by all District and Division offices in their review of proposed National Pollution Discharge Elimination System (NPDES)permit applications as to their effect on navigation and anchorage. One provision of the regulation is that no NPDES permit will be issued if it will cause substantial impairment to navigation and anchorage of any of the waters protected by the Federal Water Pollution Control Act. Furthermore, in reviewing a proposed NPDES discharge the District Engineer should consider all appropriate information and data available concerning the effects of the discharge and consult with the appropriate District Commander of the Coast Guard. The proposed regulation also specifies when the District Engineer shall notify the permit applicant of his decision, and what conditions the District Engineer may attach to an approved permit. NEVADA WATER POLLUTION CONTROL REGULATIONS.
In: 1975 BNA Environmental Rep. 841:0501-5(
(State Comm'n of Environmental Protection Adopted 1972, amended 1974). 56 p, 53 tab.

Descriptors: *Nevada, *Waste disposal, *Wate quality standards, *Water utilization, *Wate quality control, Classification, Permits, Sewers Potable water, Water pollution, Water policy Water resources development, Water sports Aquatic life, Agriculture, Regulations, State ju risdiction.

To prevent the unauthorized pollution of Nevad waters, the State Commission of Environmenta Protection promulgated water pollution contro regulations. Due to the harmful effects caused b unauthorized waste discharges, a permit must no be obtained before any person or entity ca discharge wastes into state waters. A permit is als required before the construction of or additions t privately or municipally owned waste discharg sewer systems. Provisions pertaining to the appli cation for, issuance and revocation of these pe mits are presented. In addition, the regulation prescribe water quality standards for state waters These standards will vary depending on whethe the water is used for agricultural purposes aquaticlife, water contact sports, boating an aesthetics, drinking water supply, industria supply, or wildlife propagation. All waters, how ever, irrespective of their use, will have to mee the minimum specifications for the two major clas sifications: class A waters, which are located i areas of little human habitation; and beneficial us waters, which are closely associated with th drinking water supply. These two classification require minimum standards for floating solid

fecal coliforms, total phosphate, total dissolved solids, dissolved oxygen, temperature, hydrogen ion concentration, settable solids, and sewage, industrial or other wastes. (Hoffman-Florida)

NEBRASKA WATER QUALITY STANDARDS.
In: 1973 BNA Environmental Rep. 836:0501-23 (Dept. of Environmental Control water Quality Standard Applicable to Nebraska Waters, 1972 as amended 1973). 23 p, 7 tab, 2 fig, 2 append, 2 chart.

Descriptors: *Water quality standards, *Nebraska, *Legislation, *Federal Water Pollution Control Act, Water pollution sources, Surface waters, Water quality control, Law enforcement, Regulation, Hydrogen ion concentration, Dissolved solids, Dissolved oxygen, Odor-producing algae, Temperature, Water pollution control, Water pollution treatment, Water pollution, Water policy.
Identifiers: *Antedegradation policy.

The state of Nebraska, pursuant to the Federal Water Pollution Control Act, has promulgated water quality standards to protect and enhance the quality of state waters. These standards set forth minimum general criteria which must be met a by all state surface waters. Because of various water use requirements, the standards also require that state waters be classified into various categories having specific water quality criteria that must be met in addition to the general criteria. These criteria relate to the following factors: fecal coliform organisms; taste and odor producing substances; suspended colloidal or settable solids; toxic and deleterious substances; temperature; dissolved oxygen; hydrogen ion; total dissolved solids; oil and floating substances; and aesthetic condition. To insure compliance with these standards, a comprehensive monitoring program has been set up. This monitoring will be accomplished through the data collected from over 250 sampling sites across the state. In addition to the water quality criteria, an antedegradation plan is put into effect to prevent the pollution of high quality state waters which are presently above the minimum criteria. Under this plan any industrial or private project constituting on increased source of pollution will be required to provide the necessary waste treatment needed to maintain the current water quality level. WATER RESOURCES PROBLEMS RELATED TO MINING.
American Water Resources, Association, Minneapolis, Minn.
Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota. 236 p. Hadley, R. F., and Snow, D. T., editors. $15.00.

Descriptors: *Mining, *Mine drainage, *Water resources, *Water pollution sources, *Conferences, Mineral industry, Coal mines, Industrial water, Water rights, Legal aspects, Spoil banks, Mine wastes, Water pollution, Water quality, Groundwater, Rivers, Streams, Acid mine water, Geochemistry, Chemical reactions, Heavy metals.

The purpose of the symposium was to examine many of the questions that deal with water resources problems related to mining. The mining industry is faced with problems of controlling stream and aquifer pollution, waste disposal, transport of solids by water, leaching of ores and tailings, and water supplies. Data and interpretations from studies of mine drainage, mine-waste management, mine hydrology, acquisition of water supplies, and environmental impacts of mining operations were considered. While many of the problems are far from satisfactory solution, the symposium revealed that efforts by the scientific community and the mining industry are making good progress toward solving many of the problems. Identifiers: *Preoperational planning.

One aspect of mining management practice made important by increased environmental concern is the restoration and reclamation of streams and rivers affected by mine drainage. Streams and rivers must be an integral part of the total mined land reclamation effort because when in good condition they can receive and transform industrial, municipal, or mine wastes and furnish other economic and aesthetic benefits - these benefits may be seriously reduced or destroyed if the stream ecosystem is badly overloaded. The consequence of this overload is a severaly polluted stream or river which may be highly visible evidence of the neglect or mistakes of a mine operator. A low cost solution to the problem of mine drainage disposal is optimal utilzation of stream receiving capacitty based on an understanding of physical-chemical relationships, and biological assimilative capacity. In most cases data of biological, hydrologic or water quality importance is not available and is quite costly to obtain. Hydrologic and water quality models have been applied to a typical mine drainage situation. This technique provides a low cost method of environmental data acquisition encouraging development of a data base to include streams and rivers in preoperational planning efforts. Identifiers: *Impact assessments.

Data gathering, evaluation, and planning required to satisfy government environmental regulations can also provide an effective data base which can be used to optimize efficiency and safety of mining operations. Attendant cost savings should then result both in terms of actual production efficiency and minimizing costly governmental and private citizen confrontations. One of the most essential components of long-term environmental effects from mining is the water resource system. It is important that the mine operator adopt the philosophy that significant opportunity to better develop and manage his mining operations can be realized by both promptly and objectively addressing the problem of environmental impact assessment. This opportunity for ultimate cost savings is maximized in proportion to the qualified expertise employed to acquire a comprehensive and defensible hydrogeologic data base, as early as possible in the initial exploration program. The procedure presented is general in nature, in order to afford the flexibility required to incorporate site specific variables, as well as regulatory agency-specific variables to enable its ubiquitous application. Regardless of the locale in which it is employed, it will provide a circumspect evaluation of the hydrogeologic system, as it can best be managed to maintain acceptable environmental quality and to provide profit levels which will in-

sure the needed growth of mineral resource development in the United States. (See also W76-06938) (Sims - ISWS)

THE HYDROLOGY OF AN ACID MINE PROBLEM,
Idaho Univ., Moscow.
B. D. Trexler, Jr., D. R. Ralston, W. Renison, and R. E. Williams.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 32-40. 6 fig, 1 ref.

Descriptors: *Mine drainage, *Mining, *Acid mine water, *Water pollution, *Mine drainage, *Idaho, Surface waters, Groundwater, Groundwater recharge, Infiltration, Hydrology, Streams, Water pollution sources, Water pollution control, Groundwater movement, Dye releases, Water quality, Pollution abatement.
Identifiers: Reduction of recharge, *Bunker Hill Mine(Idaho).

Acid mine drainage from the Bunker Hill Mine discharges into the Bunker Hill tailings pond and constitutes a major portion of the treatment cost. The discharge averages 2,700 gallons per minute of water at an average pH of 3.3. The availability of water to transport acid salts throughout the mine is second in importance only to the heterogenous presence of pyrite in the ore. Hydrographs of certain flows within the mine and local streams show similar trends. This similarity implies direct interconnection between the land surface water in the mine. Recharge to the mine has been identified in four areas. First is an area of subsidence and related fractures resulting from mining by caving. Second is a drift and stope which intersects the streambed of Milo Creek. Third and fourth are areas where the close proximity of the stopes to the land surface may have induced fractures due to subsidence of intersected previously faulted areas. Drainage facilities may be designed to bypass the surface runoff from the recharge areas and sealants may reduce direct infiltration. Reduction of recharge to the mine will minimize the treatment cost. (See also W76-06938) (Sims - ISWS)

IMPACT OF ARGO TUNNEL ACID MINE DRAINAGE, CLEAR CREEK COUNTY, COLORADO,
Colorado School of Mines, GoldenDept. of Chemistry; and Colorado School of Mines, Golden. Dept. of Geochemistry.
J. M. Boyles, D. Cain, W. Alley, and R. W. Klusman.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 41-53. 7 fig, 5 tab, 11 ref. NSF-SOS GY-10798

Descriptors: *Mining, *Acid mine water, *Mine drainage, *Heavy metals, *Colorado, Water quality, Water treatment, Water pollution, Water pollution sources, Neutralization, Lime, Pollution abatement, Pollutant identification, Iron, Copper, Zinc, Cadmium, Manganese, Laboratory tests, Sampling, On-site data collections.

The Argo tunnel acid mine drainage, Idaho Springs, Colorado, was investigated concerning its impact on the water quality of Clear Creek and possibilities for minimizing this impact. Laboratory studies indicated the following order of precipitation of Argo's heavy metals with rising pH: Fe, Cu, Zn, Cd, Mn. This order of precipitation was substantiated by data from extensive water sampling in the Argo area. On the basis of the USPHS drinking water standards, Fe and Mn were the most serious contaminants introduced into Clear Creek. However, the data indicates that Cu, Zn, and Fe from the Argo drainage will be detrimental to fish and other aquatic life downstream. Metal concentrations in Clear Creek downstream from the Argo drainage will generally be the greatest during the winter months when the flow of Clear Creek is low. The heavy metal content of limonite coatings on rocks downstream from the Argo drainage reflects the order of precipitation of heavy metals in the creek water. Fly ash, lime, limestone, and soda ash were used to neutralize Argo water, with lime giving the best results. Calculations indicated that neutralization of Argo water may be economically feasible if Cu, Zn, and possibly Mn, are recovered. (See also W76-06938) (Sims - ISWS)

ENGINEERING, ENVIRONMENTAL AND ECONOMIC PLANNING FOR COAL REFUSE DISPOSAL,
D'Appolonia (E.) Consulting Engineers, Inc., Pittsburgh, Pa.
J. H. Poellot, and R. G. Almes.
In: Water Resources Problems related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 99-108. 4 fig, 2 tab.

Descriptors: *Mining, *Coal mines, *Mine wastes, *Solid wastes, *Coal mine wastes, Planning, Economics, Engineering, Environmental effects, Operating costs, Waste disposal, Water pollution, Water pollution control, Infiltration.
Identifiers: *Coal refuse disposal.

In the past, coal refuse from underground mining has been considered only as a waste material to be disposed of as cheaply as possible, with little or no concern about the influence various mining and preparation processes have on the disposal of the refuse. Increasing concern for the environmental effects of refuse disposal and the costs of minimizing environmental damage have resulted in an increased interest in planning the refuse disposal operation and an increased awareness of the overall costs of refuse disposal. Proper planning of a disposal facility must consider all cost both capital expenditures and operating costs over the life of the facility, as well as the effect of mining and preparation plant operations on the cost of refuse disposal. Optimizing the total coal refuse disposal operation requires planning that begins while the mining and preparation methods are being planned. However, decisions concerning the mining and preparation methods are frequently made without consideration of the refuse disposal operation. Even in these cases, the total cost of refuse disposal and the environmental impact can be minimized by considering in detail the alternative site and methods of disposal which are available. Identifiers: *Clearwater Lake(Mo), Smelters.

The discovery of rich lead deposits in southeastern Missouri in 1955 has led to the indudstrial development of this previously rural Missouri area. Since initial production was begun in 1967, are production has increased so that 488,200 tons of lead were produced in 1973. Data has been collected relative to the quality of regional air, soils, streams, flora and fauna for the past four years. This information has been used by both industry and government in reviewing regulations and production practices and assists in reaching satisfactory solutions to control possible sources of pollution. This paper discussed some of the water resources problems and their solutions within the New Lead Belt. There were generally few differences between control and receiving streams in regard to physical and chemical parameters. Higher turbidity and suspended solids were found in samples taken at or near industrial outfalls with periodically elevated levels of phosphorus and nitrogen occurring in streams having occasional algal blooms. Most of the phosphorus and nitrogen present is tied up in the aquatic life forms or in dissolved compounds. Many of these are probably products of the stream biota. A relatively high carbonate content and slightly basic pH (7.8-8.3) account for minimal levels of dissolved heavy metals being present. The comparison of filtered versus unfiltered stream water samples has shown that considerable quantities of heavy metals are present in the finely divided, suspended particulate state. Heavy metals contents in the streams have exceeded those standards set by the Missouri Clean Water Commission on a relatively few occasions. (See also W76-06938) (Sims - ISWS)

WATER PROBLEMS IN ALBERTA OILSANDS DEVELOPMENT,
Alberta Univ., Edmonton.
A. H. Laycock.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 184-200. 8 fig, 4 tab, 15 ref.

Descriptors: Oil, *Sands, *Canada, Water resources, Water supply, *Hydrologic budget, Industrial water, Oil industry, Surface waters, Rivers, Groundwater, Geology, Effluents, Spoil banks, Water policy, Water reuse, Evapotranspiration, Strip mines, *Mine wastes.
Identifiers: *Oilsands, Alberta, *Athabasca River(Alberta), Tailings.

The subject was presented in four stages: (1) a general survey of the Alberta oilsands resource and the status of its development, (2) a review of internal water balance patterns for the major plants, (3) a discussion of external water balance relationships, and (4) suggestions of alternative ght be resolved. The oilsands are located in northeastern and northcentral Alberta with current development north of Fort McMurray about 300 miles from Edmonton. The Alberta Energy Resources Conservation Board has estimated the oil content of these sands as 895 billion barrels. The present surface mining is being done about 20 to 25 miles north of Fort McMurray to the west of the Athabasca River. Very large scale operations and a large amount of water is to be used in the extracting and upgrading operations. The anticipated water balance in the period 1983-1991 was initially assumed to have involved the use of much more reclaimed water than raw river water. In the more recent estimates, the ratios are approximately two parts raw water to one of reclaimed waters. Potential evapotranspiration normally exceeds precipitation by about two inches per year. A strong reason for conservation of water supply and for utilization of local supplies in Alberta is the problem of having more on hand within the lease areas than can be disposed of by evaporation and other means. If local supplies can be used or reused in place of water from the major rivers, especially in the wetter years, the problems of effluent disposal may be reduced. (See also W76-06938) (Sims - ISWS)

WATER AND THE BRITISH COLUMBIA MINING INDUSTRY,
Ker, Priestman and Associates, Ltd., Victoria, (British Columbia).
W. A. Ker.
In: Water Resources Problems Related to Mining; Proceedings No. 18, June 1974. American Water Resources Association, Minneapolis, Minnesota, p 201-209. 2 fig, 1 tab.

Descriptors: *Mining, *Mills, *Water supply, Water resources, *Canada, Copper, Water reuse, Water policy, Water permits, Water conservation, Industrial water, Planning, Economics, Environment, Water pollution control.
Identifiers: *British Columbia, Tailings.

An adequate supply of water is essential for a successful mining operation. Without it, some of the richest deposits in the world would prove to be of little value as the concentrates could not be produced economically. In British Columbia, with its abundance of lakes and fast flowing rivers, it is taken for granted that there is an ample supply of water for every conceivable purpose. While this may be true in certain areas, it is found, on closer investigation, that the rivers and streams in the majority of the Province are subject to extreme fluctuations in flow, with the result that conditions vary during the year from possible flooding to extreme drought. As all mining operations must operate on a year-around basis for economic reasons, this factor can prove to be of major importance, especially to a large mine. Most of the mining projects which have been developed in British Columbia over the past twenty years have been large-volume, low-grade, open pit operations. Of these, the majority have been copper producers, i.e., Gibraltar, Brenda, Lornex, Bethlehem, Utah, which are in the range of 25,000-45,000 tons per day capacity. Unless the proposed development is fortunate in being located adjacent to an adequate source of water, conveyance works of some considerable magnitude may be required to bring water to the site or, alternatively, the mill must be located some distance from the mine. In either case, the cost of operation would increase and the matter of feasibility becomes a straight study of economics. (See also W76-06938) (Sims - ISWS)

OIL SPILL CONTROL, PART 1: PREVENTION,
Pace Co., Houston, Tex.
P. L. D'Alessandro, Jr., and C. B. Cobb.
Hydrocarbon Processing, Vol. 55, No. 2, p 121-124, February, 1976. 5 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, Oil spills, Personnel, *Water pollution control.
Identifiers: Oil spill prevention plan.

Oil spill control can be divided into two parts: prevention and counter-measure. Prevention is planned voluntary action performed under controlled condition while countermeasure is an involuntary reaction to an emergency situation. An oil spill prevention plan consists of a comprehensive assessment of the situation followed by continuous training, testing and maintenance, and inspection. A successful program requires adequate and compete training designed to build confidence, insure competence, and provide motivation. Involving the operating personnel in the development of a spill control plan is one means of assuring a personal commitment of spill prevention. Since the installation of fail-safe devices can lead to complacency, circumstances should be created periodically in which these devices are required to work. Periodic inspection of equipment should be performed based on prepared inspection forms which list possible leak sources, required inspection frequency, and optimum timing for each inspection. A list of possible leak sources and specific items to be inspected/tested for each source is presented. This list is presented as a guide which can be tailored to fit a particular installation. It includes tank leaks, overfilling tanks, tank rupture and boilover, pipe, valve and fitting leaks (both bureied and unburied), inadequate dike volume, containment dike leaks, containment area drainage valve leaks, dike drainage, and water drawoff and tank cleaning. (Orr-FIRL)

WATER POLLUTION CONTROL, MIDCOURSE CORRECTION,
Texaco, Inc., Beacon, N.Y. Environmental Protection Dept.
M. A. Wiley.
Chemtech, Vol. 6, No. 2, p 134-141, February, 1976. 25 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, *Legislation, Federal Water Pollution Control Act, *Water pollution control.
Identifiers: PL 92-500.

Experiences of the petroleum industry in choosing the most cost-effective methods to meet the requirements of PL92-500 are discussed. The need for substanial improvements in this legislation is documented from several viewpoints besides the industry's. The following conclusions and recommendations were drawn based on the industry's experiences. The total annualized costs for water pollution control facilities are quite high and usually amount to about one-quarter to one-third of the capital investment. Both the capital investment and total annualized costs to taxpayers and consumers should be minimized. The limited funds available for water pollution control should be apportioned on the basis of environmental equity among all classes and categories of discharges to the same water body. Excess capacity should be avo ided in treatment plants. The existing pretreatment and user charges provided for in the Act do not encourage maximum beneficial use of the municipal systems and control of urban drainage quality. Correction at the source rather than treatment is more effective for early control of contaminated urban drainage. Sewage collection and treatment systems that are more labor-intensive should improve long-term job opportunities. Regional sewer systems are generally more expensive than local systems with greater numbers of strategically located treatment plants. The conflicting roles imposed upon the EPA by the Act should be resolved. The Act should be corrected now in mid-course, rather than be replaced with other untried regulatory concepts. (Orr-FIRL)

NON-POINT AND DIFFUSED WATER SOURCES: A VARIABLE SOURCE AREA PROBLEM,
Georgia Univ., Athens. School of Forest Resources.
J. D. Hewlett, and C. A. Troendle.
In: Watershed Management Proceedings Symposium of American Society of Civil Engineers, New York held in Logan, Utah, August 11-13, 1975. p 21-46 (1975) 9 fig, 18 ref.

Descriptors: *Hydrologic cycle, Hydrology, Moisture, Physical properties, Slope stabilization, Water sources, Water pollution sources.
Identifiers: *Non-point pollution, Fernow Experimental Forest(W Va), Stormflow.

Scientists at the Forest Service Timber and Watershed Laboratory in cooperation with scientists at the University of Georgia have developed a preliminary version of a completely physically based model of the land phase of the hydrologic cycle. Based on the variable source area concept, the model responds well to changes in slope length and grade, soil depth and physical properties, and antecedent moisture conditions. The model appears to simulate stormflow from experimental basins on the Fernow Forest quite well and after further testing, it should be useful elsewhere. The model will not only be useful for simulating streamflow but also as an educational tool in teaching hydrologic processes and as the basis for evaluating the impact of various management practices on non-point pollution. SELF-PURIFICATION OF SOME RIVERS OF THE LATVIAN SSR FROM SUBSTANCES DETERMINING THE BIOCHEMICAL OXYGEN DEMAND VALUE, (IN RUSSIAN),
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Wood Chemistry.
E. A. Aunin'sh.
Latv Psr Zinat Akad Vestis. 3, p 23-29, 1974.

Descriptors: *Self purification, Water purification, *Biochemical oxygen demand, Rivers, *Hydrologic aspects, Aeration, Water pollution control.
Identifiers: *USSR(Latvian-SSR).

The self-purification ability of rivers is determined to a great extent by such hydrological factors as the stream velocity, the number of meanders and the roughness of the river-bed. The presence of numerous shoal and high stream velocity insure high self-purification ability and allow trasient overloading of rivers which does not cause irreversible changes in self-purification conditions. Systematic overloading significantly lowers the self-purification ability. The values of the coefficient of self-purification rate K1 and that of reaeration K2 for the rivers Rezekne, Zapadnaya Dvina and Lielupe (USSR) are presented. Recommendations are given on the use of them.--Copyright 1975, Biological Abstracts, Inc.

FIELD STUDIES ON OZONE INACTIVATION OF A GYMNODINIUM BREVE TOXIN,
National Marine Fisheries Service, Milford, Conn. Middle Atlantic Coastal Fisheries Center.
W. J. Blogoslawski, F. P. Thurberg, M. A. Dawson, and M. J. Beckage.
Environmental Letters, Vol. 9, No. 2, p. 209-215, 1975. 1 fig., 1 tab., 11 ref.

Descriptors: *Ozone, *Gymnodinium, *Red tide, *Toxins, *Water purification, Algae, *Florida, Water pollution treatment, Sea water, Bays, Dinoflagellates.
Identifiers: *Detoxification, *Boca Ciega Bay(Fla), St. Petersburg(Fla).

In April 1974 a red tide occurred in Boca Ciega Bay near St. Petersburg, Florida, due to the toxic dinoflagellate, Gymnodinium breve. Water samples were treated with ozone, acidified to pH 6.0, and extracted with ethyl ether. The ether was evaporated, yielding a dry powder. The powder, suspended in water, was injected intraperitoneally into mice to determine toxicity. Extracts of red tide water ozonized at or above 55 ml/min were non-toxic. Mice injected with control extracts died in 2.5-3.5 minutes and showed symptoms of respiratory irregularity, violent twitching, and loss of coordination. Bubbling of air or oxygen through samples did not eliminate their toxicity. The red color faded during ozone treatment and the dry powder was gray. Ether extracts and the dry powder of control samples were green. Toxicities of extracts from field samples of red tide water were less than extracts of laboratory cultures. Toxic red tide metabolites can cause water quality problems in shellfish depuration stations and marine laboratories. The results should interest facilities needing non-toxic seawater to rear and maintain marine organisms. (Buchanan-Davidson--Wisconsin)

ENVIRONMENTAL IMPLICATIONS OF RIVER BASIN DEVELOPMENT INCLUDING WATER QUALITY MANAGEMENT: GENERAL REPORT,
Fordham Univ. Bronx N. Y. School of Law.
L. A. Teclaff.
Working Paper No. 51, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 36 p, 46 ref.

Descriptors: *River basin development, *Environmental effects, *Water quality, *Management, Water utilization, Effluents, Standards, Economics, Projects, Evaluation, Benefits, Water pollution, Pollution abatement, Cost-benefit analysis.
Identifiers: *Impacts(Environmental).

River basin development is placed in its environmental context, and concern over environmental deterioration is identified as a force in reasserting the basin's role in water management. Impacts on water quality are seen as part of the general impact on the environment of water development and use, and efforts to control them through standards, effluent charges, and financial inducements are analyzed. Next, the institutional framework for water quality management is examined on a national and international plane, with reference to pertinent papers of the seminar. In the second part of this report, means of harmonizing the impact of water projects on the environment in general are examined and evaluated. Here, the relevant papers of the seminar show that institutionalized and legally mandated harmonization of the benefits of water projects with the environmental losses they may cause is still in an early stage of development. One of the chief reasons for the comparatively slow progress in this area is the difficulty in quantifying environmental impacts. (Bell-Cornell)

ECONOMIC EFFICIENCY AND EQUITY IN WATER QUALITY CONTROL: EFFLUENT TAXES AND INFORMATION REQUIREMENTS,
Tennessee Univ., Knoxville. Dept. of Economics.
H. W. Herzog, Jr.
Journal of Environmental Economics and Management, Vol. 2, No. 3, p 170-184, February 1976. 3 tab, 19 ref.

Descriptors: *Economic efficiency, *Water quality control, *Equity, Effluents, *Taxes, Management, Programs, Assessment, Simulation analysis, Constraints, Waste treatment, Standards, Costs, Equations, Biochemical oxygen demand, Mathematical models, Systems analysis, Optimization, *Maryland.
Identifiers: *Patuxent River(Maryland), Cost minimization.

Water quality standards for any river system can be achieved under numerous management programs or assignment patterns for waste treatment responsibility. This study examines three effluent charge (tax) programs along with a management program based on equal percentage treatment. Each program is developed within the general framework of a water quality management model and is designed to minimize the total real resource cost of waste treatment subject to program constraints (information availability) and water quality standards. An assessment of the relative efficiency and equity of these programs is made within a water quality management simulation of the Patuxent River in Maryland. (Bell-Cornell)

TIMBER MANAGEMENT INFLUENCES ON AQUATIC ECOSYSTEMS AND RECOMMENDATIONS FOR FUTURE RESEARCH,
Pennsylvania State Univ., University Park. School of Forestry.
W. E. Sharpe.
Water Resources Bulletin, Vol. 11, No. 3, p 546-550, June 1975. 27 ref.

Descriptors: *Forest watersheds, Research, *Fisheries, *Management, *Water quality, Aquatic environment, *Ecosystems.
Identifiers: *Timber management, Mutual benefits.

Recent watershed research indicates that many timber management practices have profound effects on the water quality of small headwater streams. These streams often support fisheries of high value. Current knowledge seems to indicate that a definite potential exists for a symbiotic relationship between timber and fisheries management. Maximum development of both resources is attainable only if further research efforts recognize the mutually benefiting aspects of these heretofore separate disciplines. Future research should carefully examine the complex interrelationships between small headwater aquatic ecosystems and the riparian forest environment. (Bell-Cornell)

DEVELOPMENT OF WATER QUALITY MANAGEMENT INDICES,
Mitre Corp., McLean, Va.
J. B. Truett, A. C. Johnson, W. D. Rowe, K. D. Feigner, and L. J. Manning.
Water Resources Bulletin, Vol. 11, No. 3, p 436-448, June 1975. 5 fig, 6 ref.

Descriptors: *Water quality, *Management, *United States, Planning, Cost allocation.
Identifiers: Indices, Ranking.

In a joint undertaking by the MITRE Corporation and the Environmental Protection Agency Office of Water Programs Operations, three indices were developed and computed: (1) an index of water quality; (2) an index of the need for abatement action; and (3) an index of the need for water quality management planning. These indices were evaluated for some 1000 planning areas (subbasins, regional planning jurisdiction, metropolitan areas, etc.) which together cover essentially all of the area of the 48 contiguous states. Values of each index were tabulated, together with identifying information for the planning area, in descending order of the index value for all planning areas in the nation. This produced a national ranking of the index values for all planning areas. Presented is an outline of the development of the three indices, and results obtained when these indices were computed for each of some 1100 areas comprising the continental United States are given. (Bell-Cornell)

ECONOMIC RESEARCH PERTAINING TO PROBLEMS OF LIVESTOCK WASTE MANAGEMENT AND POLLUTION CONTROL,
Michigan State Univ., East Lansing. Dept. of Agricultural Economics.
L. J. Connor, and J. B. Johnson.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 33-36.

Descriptors: *Livestock, Review, *Farm wastes, Economics, Pollution abatement, Costs, Cost comparisons.
Identifiers: Economic research, *Waste management, *Pollution control, Literature reviews.

A literature review is presented on the state of the art in the economic analysis of livestock waste management and pollution control problems, major economic research findings are discussed and suggestions are made for future research. Past economic research pertaining to problems of livestock waste management and pollution control are summarized by the following categories: (1) least-cost livestock waste management systems; (2) industry structure studies pertaining to the distribution of firms by size, housing type, and waste management system; (3) nonmarket control measures for effectuating pollution control; (4) economic impact studies (static and dynamic) of nonmarket control measures; (5) economic analyses of recycling animal waste; (6) energy costs associated with alternative waste management systems; and (7) miscellaneous studies. Research studies on these problems are appraised relative to the major conclusions which can be drawn, inconsistencies in major conclusions and methodologies employed in the research studies reviewed, and apparent research voids. The impact of alternative pollution control measures are analyzed with respect to the likely effects upon individual livestock producers, the size and technology distribution of livestock production units within each industry, consumer prices, and implications for pollution control agencies. Conclusions relative to least-cost waste management systems (with and without pollution control measures assumed) are drawn wherever data are available. Research voids and areas where various research studies show conflicting results are noted. (See also W76-07154) (East Central)

EFFECTS OF ENVIRONMENTAL LEGISLATION OF CATTLE FEEDLOT LOCATION,
Ohio State Univ., Columbia. Dept. of Industrial and Systems Engineering.
D. L. Byrkett, E. P. Taiganides, and R. A. Miller.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 45-48.

Descriptors: Model studies, *Locating, *Costs, *Economics, Environmental effects, Legislation, Water pollution control, Legal aspects, Feed lots, *Farm wastes.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, *Cattle feeding.

A cost minimization linear programming model was used to study the effect of the 1972 Federal Water Pollution Control Act Amendments on the location of cattle feeding in the continental United States. Factors affecting feedlot location which were included in the model are feeder, grain and roughage availability; slaughter capacity; demand requirements; nonfeed costs; and transportation costs. The United States was divided into sixteen cattle feeding regions; all data were developed for the year 1972. This model has two unique features. One is the separate definition of regions for cattle feeding, feeders, grain, roughage, slaughter, and demand. The other is that the model considers the competition between cattle feeding and other uses for available land. This competition is modelled by increasing nonfeed costs as production in a given region increases. In regions where competition available land is great, nonfeed costs increase more rapidly; nonfeed costs increase less rapidly where competition is small. The model was then used to determine the minimum cost equilibrium location of cattle feeding. These results indicated continued growth in the southern plains and continued decline in the corn belt, eastern United States, and California. To model the effect of the Federal Water Pollution Control Act Amendments of 1972, the nonfeed costs were adjusted to describe the impact of this legislation on each cattle feeding region. Equilibrium locations were then calculated using the adjusted nonfeed costs and were compared with the equilibrium locations calculated without the legislation in effect. ECONOMIC IMPACTS OF IMPLEMENTING EPA WATER POLLUTION CONTROL RULES ON THE UNITED STATES BEEF FEEDING INDUSTRY,
Economic Research Service, East Lansing, Mich.
J. B. Johnson, and G. A. Davis.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p. 49-52.

Descriptors: Legal aspects, Water pollution control, *Economic impact, *Feed lots, *Agricultural runoff, Effluents, *Farm wastes.
Identifiers: *Federal Water Pollution Control Act Amendments of 1972, Point source discharges.

EPA announced effluent limitations for beef feedlots in February, 1974. By July 1, 1977, feedlots with point source discharges will be required to have in use the best practicable control technology currently available. The guidelines require no discharge of waste waters from feedlots except those in excess of control systems designed to accommodate runoff from local 10-year, 24-hour rainfalls and process generated waste waters. These guidelines are to be administered through National Pollutant Discharge Elimination System permits for beef feedlots of 1,000 head of more capacity. (However, beef feedlots of smaller capacity may be expected to comply through NPDES or State permit programs.) Presented are estimates of: (1) the number of beef feedlots which could be subject to effluent guidelines and (2) the economic impacts on the beef feeding industry. An additional $133 million capital outlay would be necessary to allow the 49,000 beef feedlots of all capacity levels with problems to be in compliance with EPA rules by 1977. This level of industry investment would be needed to provide feedlots with control systems consisting of diversion terraces, a settling basin, a retention pond, and pump irrigation equipment for distributing runoff to farmland. As things now stand, 95% of the investment would be imposed on feedlots with less than 1,000 head capacity. Investments could range from $8 to over $100 per head for feedlots of less than 1,000 head capacity adopting runoff control systems. For larger feedlots, per head investment would average $1.40 to $3.20. (See also W76-07154) (East Central)

IMPLICATIONS OF SELECTED NON-POINT SOURCE POLLUTION REGULATIONS FOR U.S. DAIRY FARMS,
Minnesota Univ., St. Paul.
B. M. Buxton, and S. J. Ziegler.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 57-60.

Descriptors: *Legal aspects, *Dairy industry, *Costs, Waste storage, Waste disposal, *Farm wastes, Regulation, Pollution abatement.
Identifiers: *Non-point Source Pollution Control Regulations, *Land disposal.

Federal regulations governing the land disposal of animal wastes may be forthcoming. Some states have enacted regulations or guidelines which restrict manure disposal. This study focuses on possible non-point source pollution control regulations; the number of U.S. dairy farmers affected by alternative disposal restrictions; and, where applicable, the costs of compliance with these regulations. Alternative non-point regulations are selected from existing or proposed state guidelines and these regulations are imposed on U.S. dairy farms. The following criteria are considered: restricting dairy cows, animal units, manure tonnage, and nitrogen applied per acre, and manure disposal on rolling or steeply sloping ground. The number and proportion of producers exceeding alternative restrictions are estimated based on a recent survey of U.S. dairy producers. The number of producers in the northern United States who spread manure during winter months are estimated and the aggregate cost of manure storage calculated. In addition, the location of individual U.S. dairy farms with respect to the nearest farm residence, nearest community, and public recreational area is estimated. (See also W76-07154) (East Central)
W76-07162

FEEDLOT EFFLUENT LIMITATIONS BASED UPON EXEMPLARY OPERATIONS,
Environmental Protection Agency, Washington, D.C. Impact Analysis Agency.
J. D. Denit.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 61-63.

Descriptors: *Legislation, *Feed lots, *Water pollution control, Effluents, Poultry, Costs, Geography, Climates, Farm wastes, Operations.
Identifiers: *Pollution control, *Federal Water Pollution Control Act.

Feedlots are required to comply with certain pollution control standards as stipulated in Sections 301, 304, and 306 of the Federal Water Pollution Control Act, as amended, 1972. In response to requirements in the Sections, a regulation which sets forth the specific effluent limitations for feedlots was promulgated on February 14, 1974.

The substance of the limitations thus established was no discharge of pollutants to navigable water, subject to an exception for discharges due to unusual rainfall conditions. The limitations impact existing feedlots with effluent limitations for 1977 and 1983, and new feedlot sources (as of September 7, 1973) with standards of performance and pretreatment standards. A general survey of exemplary feedlot operations is given with emphasis on the following: (1) salient features of the exemplary control concepts for a variety of livestock and poultry operations (with slides of actual facilities). (2) applicability of the exemplary concepts to existing facilities with pollution problems, including geographic and climatic variability. (3) courses of action available to feedlot operations and responsible governmental and institutional officials. (4) general costs of achieving the effluent limitations for farms using current data estimates. The exemplary operations discussed include facilities involving open lot production of beef cattle, swine, and sheep; and, housed lot production for poultry, dairy cattle, swine, and beef cattle. Tables of associated costs for various sizes and types of facilities are presented. (See also W76-07154) (East Central)
W76-07163

PARTNERSHIP IN POLLUTION CONTROL,
Illinois Pollution Control Board, Chicago.
R. T. Odell.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 66-67.

Descriptors: *Water pollution control, *Legislation, *Feed lots, *Illinois, *Farm wastes, *Permits, Waste treatment, Pollution abatement.
Identifiers: *Pollution control, *Waste management.

The 1970 Illinois Environmental Protection Act established the following 3 organizations for environmental protection: (1) The Pollution Control Board, which establishes regulations to protect the environment and sits as a quasi-judicial body that rules on cases of alleged violation of regulations; (2) The Illinois Environmental Protection Agency which monitors the environment and which, along with citizens, brings alleged polluters before the Pollution Control Board; and (3) The Illinois Institute for Environmental Quality, which collates environmental information. The current Illinois Livestock Waste Regulations are intended to meet requirements of the National Pollution Discharge Elimination System, established by the Federal Water Pollution Control Act Amendments of 1972. The most important provisions provide for the handling, storage, and field application of livestock wastes; for existing and new livestock facilities to be constructed to prevent excessive outside surface waters from flowing through the feedlot and to direct feedlot runoff to an appropriate disposal or storage area; and for the location of new livestock facilities with regard to surface waters, flood plains, unsatisfactory soil conditions, and population centers. Procedures were established for inspecting feedlots under investigation. Permits are required of livestock operations with a total of more than 1000 animal units, and other livestock operations with 999 to 1000 animal units that are causing significant pollution. W76-07164

THE NPDES DISCHARGE PERMIT PROGRAM FOR AGRICULTURAL POINT SOURCES,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
J. C. Nye.
In: Managing Livestock Wastes, Proceedings 3rd International Symposium on Livestock Wastes-1975, University of Illinois, Urbana-Champaign, April 21-24, 1975, p 68-70.

Descriptors: *Regulation, *Feed lots, *Permits, Effluents, Illinois, Indiana, Michigan, Minnesota, Ohio, Wisconsin, *Farm wastes, Water pollution sources, Agricultural runoff, Pollution abatement.
Identifiers: *Federal Water Pollution Control Act.

The Federal Water Pollution Control Act Amendments of 1972 have had far reaching impact on the agricultural community. Section 306(b) (1) (A) specifically identified feedlots as one of the point sources for which a Federal Standard of Performance for New Sources has had to be prepared. Concentrated animal feeding operations were identified as point sources of pollution in the Act, and therefore were required to apply for a National Pollutant Discharge Elimination System (NPDES) permit. A description is presented of how the agricultural portion of the NPDES program was implemented in Region V of the U.S. Environmental Protection Agency, for the states of Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin. The methods employed to obtain applications from the large feedlots are described. The interpretation of the 'Feedlot Point Source Category, Effluent Guidelines and Standards' as published in the February 14, 1974, Federal Register and the subsequent development of an agricultural permit form are discussed. The interfacing of the Federal program with existing and proposed State programs for controlling pollution from feedlots also is discussed. A brief review of the total NPDES program is presented. HYDRAULIC MODELING OF SHALLOW COOLING PONDS,
Iowa Inst. of Hydraulic Research, Iowa City.
J-C. Tatinclaux, S. C. Jain, and W. W. Sayre.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. PO1, Proceedings paper No. 11415, p 43-53, July 1975. 6 fig, 4 ref.

Descriptors: *Cooling, *Ponds, *Hydraulic models, *Probability, *Thermal pollution, Water quality control, Reynolds number, Lakes, Equations, Effluents, Shallow water, Tracers, Forecasting.
Identifiers: *Cooling systems, Power, Probability density functions.

Increasing concern about heat pollution of streams and rivers has led Federal and state agencies to set more stringent regulations on the permissible temperature increase of bodies of water receiving heated discharges from powerplants. The cooling performance of a shallow cooling pond can be determined in a hydraulic model where the residence-time distribution function of a passive tracer is measured at the intake. It is shown that within a range of discharges, i.e., of Reynolds numbers where the flow characteristics in the lake remain similar, the lake performance for a given effluent discharge can be obtained from the results obtained for a different effluent discharge. It is shown that the prototype condenser water discharge or discharger need not be scaled down exactly in the model, but that it is sufficient to insure turbulent flow. The procedure has been applied in a model study of the cooling lake for the La Salle County Power Station, Chicago, Illinois. This cooling performance of a lake at a discharge too low to be satisfactorily modeled could be inferred from the results obtained at a higher discharge. A model study could lead to an improvement in the internal dike configuration. (Bell-Cornell)

LEGAL PERSPECTIVE ON WATER QUALITY MANAGEMENT,
Pennsylvania Dept. of Environmental Resources, Harrisburg.
D. R. Blazey.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. HY5, Proceedings paper No. 11320, p 595-601, May 1975. 12 ref.

Descriptors: *Legal aspects, *Water quality, *Water pollution, *Water distribution(Applied), *Sewage treatment, Sanitary engineering, *Land use, *Industrial wastes, Environmental engineering, Planning, Sewers, Esthetics, Water consumption, City planning.
Identifiers: *Government agencies, Master plans, Regional planning.

This paper focuses upon the need of governmental agencies to have statutory authority to perform planning functions. If plans so produced are to be implemented, authority must be found to give plans compulsive force. Pennsylvania has authority of both types and is undertaking a comprehensive wastewater management planning process (COWAMP). The relationship between the state Department of Environmental Resources (DER) and municipal governments is analyzed. Considered also is the DER's authority to deny permits for sewage projects that meet water quality goals but do not satisfy or are inconsistent with comprehensive planning requirements. The DER obligation to consider broad environmental issues when evaluating applications for specific projects and to articulate standards between the municipal and state planning authority is reviewed. A cooperative relationship between the municipal and state planning authority is developed. (Bell-Cornell)

CLEAN AIR EQUALS DIRTY WATER,
Los Angeles Dept. of Public Works, Calif.
D. C. Tillman, and R. S. Horii.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. EE1, Proceedings paper No. 11125, p 87-90, February 1975. 2 ref.

Descriptors: *Water pollution, *Waste water treatment, *California, *Environmental engineering, *Air pollution effects, Smog, Zoning.
Identifiers: Population growth, Regional planning, Sanitary sewers.

Waste treatment facilities must be constructed if clean water is to be obtained. Proper engineering design is to provide a system that is adequate for future needs. Environmentalists are opposing designs that provide for future needs even though they are cost effective. Environmentalists concerned about the air quality state that growth means automobiles and new industries and therefore more smog. Many regulatory agencies control California's Clean Water Grant Program. Some of these agencies specify that design must provide for growth, and others say that design must not provide for growth. Thus, the quandary of municipalities is how to comply with conflicting regulations and still provide the best design. (Bell-Cornell)

Identifiers: *Nova Scotia Environmental Act.

A general lack of environmental problems and an overriding desire to attract new development have previously resulted in a lack of environmental legislation in the Canadian Maritime provinces. Recently, however, environmental destruction has led to comprehensive legislation. The Nova Scotia Environmental Act vests policy formulation in the Minister of the Department of Environment, the Environmental Council, and the Governor in Council, with the Minister holding the responsibility for general supervision and control of environmental management and preservation. A large degree of discretionary power has apparently been conferred upon these agencies, and the Minister as there is no legislative statement about conflicts between environmental protection and other goals. Provisions for public participation in policy formulation are also lacking. While all existing plants emitting wastes are regulated by permit no precise criteria have been set out. The Act provides for the Minister to issue an order against a polluter requiring the polluter to cease, limit or alter any discharges and repair any resulting injury. Finally, the Minister is made responsible for approvals of all new facilities likely to pollute. (Welch-Florida)

IDENTIFICATION OF PARAMETERS IN TRANSIENT WATER QUALITY MODELS FROM STOCHASTIC DATA,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
J. J. Lizcano, R. K. Krishnan, L. T. Fan, and L. E. Erickson.
Water Air Soil Pollut. 3(3), p 261-278, 1974.

Descriptors: *Mathematical models, Model studies, *Stochastic processes, Water quality, Time lag, Input-output analysis, Streams, Unsteady flow, Gradients(Streams).
Identifiers: Bard's method.

An approach is presented for the identification of parameters in time-varying water quality models from stochastic data measured at 2 points along a stream (input-output type data). The models are plug flow models described by linear 1st order partial differential equations. The method employed is to reduce the partial differential equations to a set of ordinary differential equations with the method of characteristics from which an anlytical solution is obtained. The time-lag phenomenon presented in plug flow models is used to correlate the input-output data. A gradient method (Bard's method) is employed to identify the parameters in the correlation equation.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Patents, *Oil pollution, *Water pollution control, Water pollution sources, Oily water, Oil spills, Barriers, Winds, Flow, Equipment, Separation techniques.
Identifiers: Oil recovery, Control devices, Rudders.

An oil fence adapted to be positioned at an angle to its towing direction by utilizing water flow or wind force acting upon rudder plates or wind receiver plates without being subjected to any bending moment or any other undue force collects or recovers pollutants effectively from the water surface. The oil fence comprises a vertical plate, a float fixed to one side of the vertical plate, a flexible connecting means attached to the vertical plate connecting vertical plates in a water-tight manner, and directional control means attached to the vertical plate at an angle. The floating oil fence is directed at a suitable angle to a towing direction by applying a tractive force so as to collect the floating pollutants. (Sinha-OEIS)

Identifiers: Trend extrapolation, Pattern identification, Probabilistic forecasting.

The report was designed to help planners in the Army Corps of Engineers improve their expertise in long range forecasting. Twelve basic methods suitable for a wide range of technological, economic, social, and environmental forecasting problems were selected and discussed. Procedures for using each method were described and illustrated with examples. Some 150 forecasting techniques were listed in the appendix. (Sims - ISWS)

B. Eichert.
Technical Paper No. 41, The Hydrologic Engineering Center, U.S. Army Corps of Engineers, Davis, California, March 1974. 26 p, 12 fig, 1 tab.

Descriptors: *Water resources, *Projects, *Simulation analysis, *Flood control, Effects, Hydrology, Economics, Computer programs, Reservoirs, Alternative planning, Evaluation, Reservoir operation, Multiple purpose, Mathematical models, Systems analysis.

The HEC-5C simulation model should be a useful tool for planners to evaluate the effects of water resource projects and nonstructural alternatives in most river basins because it can accurately, quickly, and inexpensively simulate the hydrologic and economic responses of the system. This report discusses the model in terms of its need, its purpose, computer requirements, the general capabilities of the computer program, reservoir operational criteria, average annual flood damage evaluation, multiflood selection and operation, evaluation of alternative reservoir systems and of nonreservoir alternatives, model data requirements and output, and future use of the model for multipurpose systems. Considerable engineering ingenuity will be required to insure that proper data is used in the model and to insure valid results; also, the proper sequence of alternatives must be evaluated in order to determine the best plan for the reduction of damages in a basin. The model will be useful for simulating multipurpose reservoir operation. (Bell-Cornell)

ECONOMETRIC MODEL TO AID IN URBAN PLANNING DECISIONS,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia).
J. F. Brotchie, R. Sharpe, and A. R. Toakley.
Journal of the Urban Planning and Development Division, Vol. 99, No. UP1, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 9587, p 25-46, March 1973. 5 fig, 12 tab, 6 ref.

Descriptors: *Planning, Computers, *Land use, *Mathematical models, *Systems analysis, Econometrics, Equations, Linear programming, Water resources, Optimization, Costs, *City planning, *Australia.
Identifiers: Mathematical programming, Allocations, Systems engineering, Sensitivity analysis, Port Phillip Bay(Australia), Activity-space-time model, Linear activity space model, Quadratic activity-space model.

This paper describes an econometric model for use in a systems approach to urban planning, which has the capability of allocating activities of the localized type such as residential, various densities, industrial, commercial, water and sewage systems, agricultural, and recreational to potentially suitable spaces or zones in the environment, such that some measure of merit is maximized. Merit may include the costs of establishing, operating, and servicing the activities in the spaces and the costs of interactions between activities in spaces, such as those of traffic flows, pipe networks, and economies or diseconomies of scale or proximity such as where two adjacent activities share the same service trunk, or complement each other economically. Mathematically, the model is a mathematical programming model. In general application, it is an allocation model, and particularly it is an urban planning aid. Physically, it is a computer program which includes both the model and its solution techniques. (Bell-Cornell)

EX POST EVALUATION OF THE SOCIO-ECONOMIC EFFECTIVENESS OF LARGE WATER RESOURCES PROJECTS,
Water Resources Center, Budapest (Hungary).
S. Ress.
Working paper No. 55, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 5 ref.

Descriptors: *Water resources development, Economics, *Social aspects, *Costs, *Benefits, Evaluation, Engineering, Methodology, Optimum development plans, Control, Operations research, *Project post evaluation.
Identifiers: *Socio-economic effectiveness.

For the optimum socio-economic development of catchment areas and for the economically optimum realization of the operative processes planned (ex ante) on the basis thereof, the implementation of a sequence of complex control and regulation operations is necessary. The effectiveness of these operations, namely the physical, engineering, economic and social processes taking place in the catchment, is reflected by one of the most comprehensive, complex systems of evaluation, namely the analysis of socio-economic effectiveness. In this analytical system of evaluation, the costs of control measures implemented, or to be implemented, for attaining one of several definite socio-economic objectives are related to the benefits realized in the system of labor division developed in a particular catchment. The evaluation indicates further the extent to which the resources expended for meeting the demands for water management of society are utilized, as well as the role it plays on the level and rate of socio-economic development. The results of the analysis will provide, moreover, valuable information for the operation and implementation of the control and regulation processes in the catchment. (Bell-Cornell)

TOWARDS OPTIMAL DECISION STRATEGIES FOR REDEVELOPMENT PROGRAMS: A CASE STUDY,
Vrije Universiteit, Amsterdam (Netherlands). Dept. of Economics.
P. Nijkamp, and C. Verhage.
Working Paper No. 43, UNDP/UN Interregional Seminar on River Basin and Interbasin Development, Budapest, Hungary, September 1975. 16 p, 1 fig, 5 tab, 5 ref.

Descriptors: *River systems, *Optimum development plans, *Cost-benefit analysis, *Projects, *Comprehensive planning, Investment, Drainage, Control, Land use, Decision making, Economics, Hydrologic aspects, Equations, Systems analysis.
Identifiers: Impact analysis.

This paper investigates how to deal with the wanted and unwanted consequences of a public investment project aimed at improving the drainage function of a riversystem in the Northern part of the Netherlands. The drainage improvement project is a part of a long-term reconstruction plan for the agricultural area involved. The main objective of the plan is to promote the economic opportunities and expand the social and cultural facilities for the regional population. Since some impacts are intangible and/or unintended, the usual cost-benefit analysis is not feasible here. However, a modified cost-benefit analysis is proposed to estimate the intangible environmental effects of the water project. An extension of the impact analysis into a dynamic framework is introduced by means of optimal control. A comprehensive regional redevelopment plan is essentially a strategy to realize an optimal spatial layout in a certain period of time, which will require knowledge about the optimal time path of the investments which change the land-use. (Bell-Cornell)

INTERTEMPORAL AND INTERGENERATIONAL PARETO EFFICIENCY,
Arizona State Univ., Tempe.
T. Sandler, and V. K. Smith.
Journal of Environmental Economics and Management, Vol. 2, No. 3, p 151-159, February 1976. 2 tab, 25 ref.

Descriptors: *Economic efficiency, *Resource allocation, *Benefits, Environment, Optimization, Equations, Recreation, Mathematical models, Systems analysis.
Identifiers: *Pareto efficiency, Reference group, Public goods, Private goods, Intergenerational, Intertemporal.

Proposed is an extension to the definition of Pareto efficiency in resource allocation. By introducing the concept of a reference group, the authors extend the static definition of efficiency to intertemporal and intergenerational generalizations. Efficiency conditions are derived for both private and public goods which provide benefits over time. In deriving these conditions, the paper extends the notion of efficiency to an intertemporal Pareto-optimal conception requiring the maximization of the ith individual's utility at a point of time subject to the constancy of his utility in all future periods and that of all other individuals during the relevant time span. By permitting births and deaths, a generalization of the basic model recasts the analysis into an intergenerational setting. Additional extensions involve learning by doing perpetual public goods. Included among several examples is that of water recreational facilities. The paper concludes that several of the conventional practices in public expenditure analysis do not conform to our definition of intertemporal Pareto efficiency. (Bell-Cornell)

IDENTIFYING THE PUBLIC IN WATER RESOURCE PLANNING,
Georgia Inst. of Technology, Atlanta.
G. E. Willeke.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Socity of Civil Engineers, Proceedings paper No. 12064, Vol. 102, No. WR1, p 137-150, April 1976. 7 ref. OWRT B-095-GA(2).

Descriptors: *Water resources, *Planning, *Social participation, *Social needs, Communication.
Identifiers: Demographic characteristics, Public participation.

The public is not a unitary mass, but rather is comprised of segments (publics) of the general public. Identification includes locating the publics, determining their interests and their social and demographic characteristics, and learning how to communicate with them. Publics are identified to increase the range and richness of issues and concerns brought to salience in the planning process. Identification techniques are divided into three groups: (1) self-identification, (2) third-party identification; and (3) staff identification. Self-identification is done through correspondence, petition, appeal, public hearing, election, suit, protest, and publicity. These processes may be enhanced by providing structures for self-identification. Third-party identification is done by asking

some person or group to identify those groups or individuals who should be involved. Staff identification includes analysis of associations, geographic analysis, demographic analysis, historical and comparative analysis, the use of general lists, field interviews, and analysis of affected publics. The analysis herein includes: descriptions of identification techniques; and an appraisal of the suitability of each technique, considering time, cost, legality, and effectiveness, as well as local social and political constraints. 6D. Water Demand

AN EXPLORATORY APPLICATION OF TWO METHODS OF ANALYZING WATER USE TIME SERIES,
Hawaii Univ., Honolulu. Water Resources Research Center.
J. E. T. Moncur.
Technical Report No. 91, June 1975. 16 p, 2 fig, 3 tab, 6 ref. OWRT A-045-HI (1) 14-31-0001-4011.

Descriptors: *Water demand, *Prices, *Time series analysis, *Regression analysis, Water utilization, Estimating, *Hawaii, *Water consumption, Methodology.
Identifiers: *Spectral density.

The usefulness of two procedures for analyzing water use time series data was investigated. A simple procedure for translating price data into a form suitable for a standard regression estimation of the demand function for water is first noted. Then a simple spectral density estimation model is applied to Honolulu water consumption data in search of identifying periodicities or cyclical regularities of water demand. Both procedures show promise of useful interpretation, though the conclusions are tentative.

LEGAL ASPECTS OF LIMITED ENTRY FOR COMMERCIAL MARINE FISHERIES,
Louisiana State Univ., Baton Rouge. Law School
H. G. Knight, and J. P. Lambert.
Report to National Marine Fisheries Service Louisiana State University (Center for Wetland Resources), Oct. 1975. 123 p, 2 fig.

Descriptors: *Fish management, *Fish conservation, *Fisheries, *Commercial fishing, Fish stocking, Fish populations, Fishing, Ecology, Number fish per acre, Fish harvest, Fish establishment, Jurisdiction, Fish farming.
Identifiers: *Limited entry.

Limited entry is a management concept designed to provide the maximum sustainable fish yield while at the same time reducing the effort applied to catching fish in a commercial fishery. The establishment of a limited entry system generally requires the following elements: (1) acquisition of a jurisdictional base for management; (2) determination of allowable catch; (3) determination of optimal amount of effort; (4) international allocation of resources; and (5) the allocation of entry rights, both initial and subsequent. This report presents a detailed legal analysis pertaining to each of these elements. It also fully explores the domestic and international jurisdictional problems which may arise in the development of a limited entry system. The authors conclude that the diverse needs and economics of individual fisheries and fish industries prevent the drafting of a generalized draft of legislation for a model limited entry system; nevertheless, several issues should be explored by drafts of a limited entry system, including: the purpose and rationality of the program; the determination of an optimal level of effort; the allocation of entry permits; and interstate and state-federal coordination problems. DIFFUSED SURFACE WATERS IN MISSISSIPPI,
H. A. Schutz, III, and J. B. Tohill.
Mississippi Law Journal, Vol. 41, No. 1, p 118-146 (1975). 29 p.

Descriptors: *Alteration of flow, *Mississippi, *Surface waters, *Legal aspects, *Reasonable use, Drainage, Drainage systems, Drainage water, Surface runoff, Water resources, Erosion, Flooding, Adjacent landowners, Common law, Civil law, Equity, Judicial decision, State governments, Penalties(Legal), Water law, Economics, Cost-benefit analysis, Water conveyance.
Identifiers: *Common-enemy rule, Injunctions.

An analysis of the Mississippi case law concerning diffused surface water indicates that the Mississippi courts traditionally have followed a modified version of the 'common-enemy' rule. This rule generally allows a landowner to change the flow of diffused surface waters where the change causes no unnecessary harm. Recently however, the Mississippi courts have injected a reasonableness standard, balancing the benefits and costs to the owners of all affected land. Thus, the Mississippi courts appear to be moving closer to a 'reasonable-use' test as the best method to protect the interests of both landowners and the general public.

CLASSICAL WRITERS OF INTERNATIONAL LAW AND THE ENVIRONMENT,
Montana Univ., Missoula. Dept. of Political Science.
F. L. Grieves.
Environmental Affair, Vol. 4, p. 309-322 (1975), 14 p.

Descriptors: *International law, *Environmental effects, *Water quality control, *Law of the sea, *International waters, Foreign trade, Foreign waters, Water utilization, Water resources, Mining, Water pollution, Water pollution control, Water pollution abatement, Pollutants, Water quality control, Navigation, Economics, Ownership of beds, Governments, Governmental interrelations, Water law, Navigable waters.
Identifiers: *Seabed mining.

Some important environmental problems encountered today stem from legal principles inherited from the classical period of international law. Although these principles were developed to meet then current problems, theyn are not adequate to handle the international situation which exists today. The early classical writers of international law, dealing with seemingly limitless natural resources, asserted the principle of free use of the sea--the fruits of the sea were available to anyone who could take them. While later writers became aware of the need to limit the use of the seas to some extent the predominant principle in international law continues to be the widespread exploitation of the seas with as few controls as possible. A counter principle, better adapted to the environmental problems faced today is the less popular idea of res communis. Under this concept the seas are community property to be managed for the good of all mankind. If accepted, the res communis concept would provide a vehicle for stabilizing and guiding the use of international areas as well as for avoiding wasteful, uncontrolled unilateral exploitation of international resource. THE ENVIRONMENT AND THE LAWYER,
Environmental Protection Agency, Washington, D.C.
J. R. Quarles, Jr.
Federal Bar Journal, Vol 33, p. 112-118 (1974), 7 p.

Descriptors: *Federal Water Pollution Control Act, *Clean Air Act, *Legal aspects, *Environmental effects, *Federal government, Legislation penalties(Legal), Industries, Economics, Financing, Water law, Water pollution, Water pollution sources, Water pollution effects, Water quality, Water quality control, Water pollution control, Water pollution abatement, Pollutants, Water quality standards, Organizations.
Identifiers: *Environmental Protection Agency.

The Clean Air Act and the Federal Water Pollution Control Act have greatly affected the legal profession in the areas of business, industry and the environment since the acts constitute important steps in strengthening legal methods of pollution control. They have, with their numerous stringent requirements affecting attorneys with corporate practices, forced many lawyers to bring federal pollution regulations into the scope of their concern. It is hoped that environmental protection will become more and more a cooperative rather than adversary process. (Nursey-Florida)

CANADA AT THE THIRD LAW OF THE SEA CONFERENCE: POLICY, ROLE, AND PROSPECTS,
British Columbia Univ., Vancouver. Inst. of International Relations.
B. G. Buzan, and B. Johnson.
Law of the Sea Institute, Occasional Paper 29 (Dec. 1975). 25 p, 3 tab.

Descriptors: *Water policy, *Canada, *Law of the sea, *International law, Water resources, *Foreign countries, Jurisdiction, Navigation, Commercial fishing, Research and development, Beds, Straits, Islands, Decision making, Administration, Institutional constraints, Political constraints, Legal aspects.
Identifiers: Archipelagos, Territorial seas.

Because of Canada's dependence on the resources of the ocean, the Third Law of the Sea Conference is of prime importance to that country. To provide an insight into Canada's position at the Conference, a synopsis of Canada's pre-Conference stance on the nine major subjects to be discussed is presented. Those subjects include the following: the continental shelf; the seabed areas beyond the limits of national jurisdiction; the territorial sea; straits used for international navigation; archipelagos; offshore islands and delimitation problems; marine scientific research; fishing; the marine environment; and navigation rights in the coastal zone. At the Conference, Canada, like other nations, will have four optional levels of action to achieve its goals - unilateral, bilateral, regional and global. Because a global agreement would provide the best hope for an optimal solution to law of the sea issues, it is probably Canada's best option. Unfortunately, economic and political disagreements may well prevent the ratification of an international treaty. Thus, Canada should view unilateral action as a viable alternative. Nevertheless, if unilateral action is taken, Canada must be careful to avoid the international resistance that developed from Canada's 1970 legislation on coastal zone navigation. (Hoffman-Florida)

WATER RESOURCES COUNCIL - FREEDOM OF INFORMATION.
Water Resources Council, Washington, D. C.
Federal Register, Vol. 39, No. 200, p. 36870-71 (1974). 2 p.

Descriptors: *Public access, *Data collections, *Federal government, *Administrative agencies, *Adoption of practices, Administrative decisions, Administration, Water law, Materials, Costs, Political aspects, Legal aspects, Political constraints, Publications, Information exchange, Public, Information retrieval.
Identifiers: *Freedom of Information Act.

The Water Resources Council has proposed the addition of a new subpart D to part 701 of Chapter VI, Title 18 of the Code of Federal Regulations describing the availability to the public of records of the Council pursuant to the Freedom of Information Act. The Council's policy is to make the fullest possible disclosure of records consistent with those obligations of confidentiality and administrative necessity reorganized by the Act. Specific exemptions from availability of information are enumerated along with a requirement that requested materials be accompanied by a reasonably specific description of the materials sought to prevent undue search or inquiry. Any requests involving a significant burden on the staff or facilities may be charged a fee, not to exceed $2.50 per half hour nor copying fee exceeding

$0.25 per page. This proposal supplements existing procedures and normal channels through which information has regularly been made available to the public. (Welch-Florida)

MONTANA WATER USE ACT.
In: 1974 BNA Environmental Rep. 831:0141-48 (Mont. Sess Laws 1973, Ch 462, Secs 1 thru 38, 1973, amended by Chs 103, 192, 238, and 265, Laws 1974). 8 p.

Descriptors: *Permits, *Montana, *Water rights, *Water resources, *Appropriation, Water conservation, Streamflow, Groundwater recharge, Groundwater, Lakes, Streams, Reservoirs, Water, Fish, Wildlife, Irrigation, Mining, Wells, Wastes, Surveys, Inspection, Investigations, Construction, Crops, Beneficial use.

The department of natural resources and conservation shall regulate water rights and establish a system of centralized records for all water rights in Montana. Any person claiming an existing water right shall furnish a declaration of existing right to the department. The department shall then file a petition for determination of existing rights in the proper district court which shall issue a preliminary decree. Hearings on the preliminary decree shall then be conducted and a final decree issued. Appeals from the final decree may be taken. On the basis of the final decree, the department shall issue to each person decreed an existing right a certificate of water right. A person may appropriate water only as provided in this act. First the applicant for appropriation must apply for a permit. The department shall then issue notice, and hearings on objections to the application shall take place. The department shall thereafter grant, deny, or modify the application; thereafter, upon actual application of water to proposed beneficial use, the applicant shall be issued a certificate of water right. MID-AMERICA TERMINAL OF KENTUCKY, INC. V OWENSBORO RIVER SAND AND GRAVEL CO (OWNER'S DREDGING NOT A TRESPASS ON LESSOR'S ESTATE IN SAND AND GRAVEL LOCATED IN RIVER BED ON SAME LAND).
532 SW2d 437-42 (Ky Ct. App 1975) 6 p.

Descriptors: *Obstruction to flow, *Kentucky, *Riparian rights, *Piles(Foundations), *Mining, Dredging, River beds, Competing uses, Relative rights, Ohio River, Sands, Gravels, Trespass, Leases, Barges, Structures.

Plaintiff owner of exclusive rights to remove sand and gravel from a river bed sought to enjoin defendant landowner from conducting activities which interfered with those rights. The plaintiff also sought to enjoin the defendant to remove all structures in the river, including pilings which the defendant had placed in the river bed as part of a temporary barge terminal. The plaintiff contended that defendant's activities constituted a trespass while the defendant argued that the riparian rights incident to ownership of the shore permitted the placing of pilings in the river bed and allowed dredging and maintenance of a barge channel. The Kentucky Court of Appeals held that each party may use its respective estate in a reasonable manner consistent with the rights of the other. The court further held that each party is entitled to prevent the other from an unreasonable exercise of rights which would deprive the other of its respective estate. (Capehart-Florida)
W76-06841

TRAX, INC. V CITY OF COLLEGE PARK (RESPONSIBILITY OF LANDOWNER FOR REMOVAL OF LANDOWNER'S OBSTRUCTION IN CREEK WHICH IS MAJOR PART OF CITY DRAINAGE).
221 SE2d 595-96 (Ga 1976). 2 p.

Descriptors: *Judicial decisions, *Georgia, *Obstruction to flow, *Drainage systems, *Cities, Stream flow, Flood control surface waters, Natural flow, Floods, Upstream, Municipal water, Adjacent land owners.

Plaintiff city sought to enjoin defendant landowner from maintaining an obstruction to the natural flow of water through a creek which was part of the surface water drainage system for the city. The plaintiff further sought to require the defendant to remove the obstruction and to restore the bed and banks of the creek to their original condition insofar as necessary to restore the natural drainage. The evidence showed that said obstruction was the major proximate cause of potential upstream flooding. Under prior case law, the city had the duty to take steps to maintain the flow of water in the creek when changes occurred which reduced the flow and made flooding of public or private property likely. The trial court directed a verdict for the plaintiff which was affirmed by the Georgia Supreme Court. (Capehart-Florida)
W76-06842

WHITE RIVER SAND AND GRAVEL REMOVAL COMMISSION V HAYES BROTHERS LAND AND TIMBER COMPANY, INC. (GRANTING LEASES OR PERMITS FOR SAND AND GRAVEL REMOVAL FROM WHITE RIVER).
532 SW2d 191-93 (Ark. 1976). 3 p.

Descriptors: *Riparian rights, *Arkansas, *Permits, *Legislation, *River beds, Regulation, Sands, Gravels, Navigable rivers, Leases, Legal aspects, Judicial decisions, State governments, Constitutional law, Real property, Rivers, River basins.

Plaintiff riparian landowner appealed the ruling of defendant commission denying the plaintiff7s application for a permit to remove sand and gravel from a portion of the river. The trial court held the 1971 statute controlling removal of sand and gravel from a limited portion of the river unconstitutional as local legislation. The Arkansas Supreme Court held that the appeal was most in view of passage by the legislature of a later act which repealed by implication the statute setting up the defendant commission. The 1975 act vested in the Department of Commerce authority and responsibility for granting leases and permits for taking sand and gravel from the beds and bars of all navigable rivers and lakes in the state. (Capehart-Florida)
W76-06843

THOMAS V HALE COUNTY (NO INJUNCTION FOR DIVERSION OF NATURAL WATER FLOW WHICH CAUSES MINIMAL DAMAGES).
531 SW2d 213-15 (Tex. Civ. Ct. App. 1975). 3 p.

Descriptors: *Municipal water, *Texas, *Ditches, *Diversion, *Storm runoff, Runoff, Surface runoff, Drainage systems, Roads, Local governments, Natural flow, Playas, Floods, Flood damage, Judicial decisions, Water conveyance.
Identifiers: *Injunctive relief.

Plaintiff landowners sought to enjoin defendant county from cutting a barrow ditch to a level which would divert the natural flow of runoff water so as to cause flooding of plaintiffs' land. In the 1950's the defendant cut a ditch to divert storm runoff from a county dirt road to a playa lake across from the plaintiffs' land. The plaintiffs' land was flooded once in the late 1950's when 12 to 15 acres were damaged. In 1975, while maintaining the dirt road, the defendant re-cut the ditch to the depth described in the plaintiffs' complaint. The evidence did not show the depth to be different from that previously maintained. The trial court denied the motion for a temporary injunction requiring the defendant to fill in the ditch pending final judgement on the permanent injunction. The Texas Court of Civil Appeals affirmed, holding that although the evidence showed diversion of water by the county, since it did not show more than a minimal probability of injury, denial of the temporary injunction was proper. (Capehart-Florida)
W76-06844

DEPARTMENT OF ENVIRONMENTAL RESOURCES V. FLYNN (PENNSYLVANIA CLEAN STREAMS LAW - ON-SITE SEWAGE DISPOSAL SYSTEMS).
344 A2d 720-25 (Pa Com Ct 1975). 6 p.

Descriptors: *Land tenure, *Pennsylvania, *Judicial decisions, *Permits, *Sewage disposal, Legal aspects, Water law, State governments, Local governments, Water pollution, Water pollution sources, Water pollution control, Water quality, Water quality control, Sewage effluents, Sewers, Waste disposal.
Identifiers: Statute of limitations.

Plaintiff state Department of Environmental Resources brought an action against defendant landowner to revoke a permit to install an on-site sewage disposal system issued to defendant under a mistake of fact. Plaintiff did not bring the action until after the expiration of the period during which an appeal could have been taken from the issuance of the permit. Defendant had meanwhile expended a substantial amount of money constructing a home on the site. The home was 75% complete at the time the action was commenced. Plaintiff contended that the proposed sewage system presented a potential danger to a downstream fish hatchery. The Commonwealth Court of Pennsylvania held that defendant had acquired a vested right in the permit despite the fact that it was issued by mistake. In reaching this decision the court found: (1) that defendant had exercised due diligence and good faith in attempting to comply with the law; (2) that he had expended substantial unrecoverable sums; (3) that plaintiff had failed to bring an appeal of the permit issuance within the specified time; and (4) that there was no proof that the sewage system would adversely affect individual property rights or the public health, safety or welfare. (Nursey-Florida)

METRO SEWER DIST. V. CHICAGO, MILWAUKEE, ST. PAUL AND PACIFIC RY. CO. (RAILROAD'S DUTY TO MAINTAIN WATERCOURSES OVER WHICH RAILROAD IS CONSTRUCTED).
230 NW2d 651-65 (Wisc. 1975). 15 p.

Descriptors: *Railroads, *Wisconsin, *Sewerage, *Bridges, *Navigable waters, Channel improvement, Stream improvement, Dredging, Drainage, Contracts, Judicial decisions, Surface waters, Civil engineering, Sewage districts, Environmental sanitation, Watercourses(Legal aspects), Common law, Bridge construction.

Improvements made in the public sewer system required several new railroad bridges to be built. This litigation involved several cases, all of which revolved around whether the railroad or the sewage district was liable for the cost of the bridges. The Wisconsin Supreme Court found that the construction of one of the bridges in question was necessitated by the improvement and deepening of a river. The river improvement was deemed necessary by the sewage district to handle adequately the increasing drainage of surface water which had been causing district sanitary sewers to overflow. Nevertheless, the sewage district contended that the railroad was liable for the bridge costs because of a contract in which the railroad agreed to maintain the watercourse. The Court rejected the contention, however, holding that the contract required the railroad only to return the watercourse to a useful condition. The court found the railroad liable for the cost of the other bridge, however, since the original bridge was obstructing the navigation of the watercourse. In so holding the court relied on a common law duty making railroads responsible at their own expense for meeting changes in watercourses. (Hoffman-Florida)
W76-06846

SUSSEX V. DEPT. OF NATURAL RESOURCES (ABSENCE OF SAFE MUNICIPAL WATER SUPPLY A NUISANCE).
228 NW 2d 173-80 (Wisc. 1975). 8 p.

Descriptors: *Water wells, *Wisconsin, *Water supply, *Water resources development, *Public health, Human diseases, Potable water, Safety, Water purification, Water quality, Social aspects, Wells, Well regulation, Water sources, Water resources, Water rights.
Identifiers: Police power.

Appellant village had been ordered by the Department of Natural Resources to construct a public water system. The Department had found that the absence of a municipal water system created a nuisance and menace to the health of the community. After the circuit court upheld the Department's order, the village appealed to the Wisconsin Supreme Court. The village put forth the following contentions: the state statute did not give the Department the authority to order the construction of a public water system; even if the statute did grant the Department such authority, another statute required a referendum by the electorate before the village could finance such a project; and the portion of the order requiring the sealing of contaminated private wells constituted an illegal taking of property without compensation. The Court rejected all these contentions, however, finding that the Department's order was valid and binding. The court found that the statute clearly gave the Department the authority to issue such an order if the health of the community was threatened and that this valid exercise of the state police power overrode any possible conflict with other state statutes. Finally, the court held that the village lacked standing to question the portion of the order pertaining to the sealing of the private wells. (Hoffman-Florida)

SWEETWATER DEVELOP CORPORATION V SCHUBERT RANCHES, INC. (APPROPRIATION RIGHTS IN DEVELOPED WATER).
535 P2d 215-19 (Colo. 1975).

Descriptors: *Jurisdiction, *Colorado, *Groundwater basins, *Water rights, *Watersheds(Basins), Wells, Adjudication procedure, Decision making, Groundwater mining, Water wells, Prior appropriation, Preferences(Water rights), Administrative agencies, Legal aspects, Judicial decisions.
Identifiers: Water rights(Non-riparians).

Plaintiff developer sought conditional decrees as to well water rights in a supplementary water adjudication proceeding. After both parties filed claims and presented proofs but before entry or decree the state ground water commission designated and created a 'designated ground water basin'. Subsequently the district court entered conditional decrees in favor of the plaintiff. On appeal the defendant challanged the jurisdiction of the district court to enter the decrees on the basis that the decrees embraced water located in a 'designated ground water basin' and that excessive jurisdiction over waters in such a basin vested in the ground water commission at the time of designation and creation. The Colorado Supreme Court upheld the district court jurisdiction. Under Colorado statutes a court can complete an adjudication proceeding involving a conditional water right if (1) prior to the designation and creation of the designated ground water basin the claim for conditional water rights has been filed and if (2) before or after designation and creation of the basin proof is introduced proving the applicant was entitled to a conditional decree prior to designation and creation of the basin. (Comer-Florida)

WARREN SAND AND GRAVEL CO, INC V COMMONWEALTH DEPT OF DEPT OF ENVIRONMENTAL RESOURCES (DREDGING OF BED OF RIVER FOR SAND AND GRAVEL).
341 A2d 556-566 (Pa Cmwlth 1975). 11p.

Descriptors: *Gravels, *Pennsylvania, *Dredging, *Administrative agencies, *Jurisdiction, State governments, Adjudication procedure, Permits, Regulation, Water rights, Legal review, Water law, Water permits, Economics, Economic input, Water quality, Water quality control, Environmental effects, Mineral industry, Sediments, Sands, Earth materials.

Three gravel companies and the Department of Environmental Resources (DER) brought cross-appeals from an Environmental Hearing Board's order granting permits to the gravel companies allowing them to remove sand and gravel from river beds. The orders prohibited dredging into natural and untouched areas except for certain specified areas. The gravel companies contended that the findings of the Board were not supported by substantial evidence and that the Board had improperly placed the burden of proof on them. DER argued that the Board had no authority to amend the original DER order and allow dredging in specified new areas. The Commonwealth Court of Pennsylvania held that the gravel companies had the burden of proving before the Board that the DER restrictions were unreasonable or unlawful and that the companies had not met this burden of proof. The court further held that the Board had the authority to modify discretionary decisions of DER and, therefore, had the authority to allow the dredging in the new areas. The Board's order was affirmed. (Nursey-Florida)

WOOD V. GIBSON CONSTRUCTION COMPANY, INC. (INCREASED DRAINAGE INTO ADJACENT PROPERTY).
313 So2d P. 898-901 (La. App. 1975). 4 p.

Descriptors: *Louisiana, *Drainage systems, *Drainage effects, *Judicial decisions, Legal aspects, Controlled drainage, Drainage water, Subsurface drainage, Water control, Civil law, Penalties(Legal), Water law, State governments, Legislation, Ditches, Drainage engineering, Water conveyance.
Identifiers: *Injunction(Mandatory), *Louisiana Civil Code Article 660.

Plaintiff homeowner brought action against defendant subdivision developer seeking an injunction to compel defendant to prevent unnatural drainage onto plaintiff's property. Plaintiff contended that drainage from the subdivision was flooding his land. Defendant contended that the subdivision development had not increased the total volume of water draining onto plaintiff's property, that the flooding of plaintiff's property had been corrected and that, in any event, plaintiff would not suffer irreparable damage. The Second Circuit Court of Appeal of Louisiana held that under Louisiana law, a servitude belongs to the estate situated below with the right to receive the water which runs naturally from the estate situated above and the owner of the higher property may take action to concentrate and speed the flow of water as long as such action does not increase the quantity of water flow. There was no evidence that defendant increased the quantity of water draining onto plaintiff's land. The court also held that since defendant had reduced the extent of flooding and the addition of greenery in the subdivision will further reduce flooding, plaintiff would suffer no irreparable damage, and therefore, no injunction should be issued. (Nursey-Florida)
W76-06850

FLA. E. COAST RY. CO. V. UNITED STATES (U.S. FLOOD DAMAGE IMMUNITY UNREPEALED BY U.S. TORT CLAIMS ACT).
519 F2d 1184-99 (5th Cir. 1975). 16 p, 1 append.

Descriptors: *Overflow, *United States, *Judicial decisions, *Flood control, *Negligence, Legal aspects, Water law, Federal government, Federal jurisdiction, Water control, Water management(Applied), Flood damage, Floods, Flood routing, Flow control, Overflow, Flood protection, Legislation.
Identifiers: Sovereign immunity, Federal Torts Claim Act, *Flood Control Act of 1948, Liability(Legal).

Plaintiff railway company brought an action against the United States Government for damage to railroad tracks located near a Government flood control project. Plaintiff contended that the damage caused by floodwaters resulted from negligent design in the flood control system which allowed a washout to occur. Plaintiff further contended that the Government was liable for damage resulting from this negligence under the Federal Torts Claims Act. The Government contended that it was immune from liability under the immunity provisions of federal flood control legislation. The Fifth Circuit Court of Appeals held that the Federal Torts Claim Act which removed federal Governmental immunity from tort liability did not impliedly repeal the immunity provisions of federal flood control legislation. Thus under this still valid legislation, the Government was immune from liability to plaintiff for the flood damage. (Nursey-Florida)
W76-06851

MOWRER V. ASHLAND OIL AND REF. CO. (ASSESSMENT OF DAMAGES FOR OIL CO'S WATERFLOOD OPERATION).
518 F2d 659-62 (7th Cir. 1975). 4 p.

Descriptors: *Injection wells, *Damages, *United States, *Judicial decisions, *Flooding, Legal aspects, Penalties(Legal), Water law, Federal jurisdiction, Injection, Oil reservoirs, Secondary recovery(Oil), Adjacent land owners, Oil, Groundwater.
Identifiers: *Nuisance(Legal aspects).

Plaintiff landowner brought a private nuisance action against defendant oil company for damage allegedly caused to plaintiff's land by defendant's waterflood operations. Plaintiff contended that defendant injected salt water at high pressure into defendant's adjacent land causing oil to seep out of a capped well on plaintiff's land. Defendant argued that it was not liable since it was lawfully conducting the waterflood operations in a reasonable and non-negligent manner. The Seventh Circuit Court of Appeals held that the waterflood opera-

tions constituted an actionable private nuisance for which neither the lawfulness of the operations nor lack of negligence could constitute a defense. (Nursey-Florida)
W76-06852

IN RE CF&I STEEL CORP (ABANDONMENT OF WATER RIGHTS).
515 P2d 456-459 (Colo 1973).

Descriptors: *Judicial decisions, *Water rights, *Colorado, Legal aspects, Water law, State governments, Economics, Economic evaluation, Legal review, Mining, Coal mines, Water demand, Mineral industry.
Identifiers: *Water rights(Non-riparian), *Abandonment(Water rights).

Plaintiff coal mine operator company brought this action to change the points of diversion of certain decreed water rights. The Company had not used these water rights for over fifty years. The trial court held that this extended period of non-use constituted an abandonment of the water rights by the plaintiff. On appeal the company contended that its non-use was excusable under Colorado law since practical and economic factors had required that the use of the water rights be discontinued. The Colorado Supreme Court disagreed, holding that an unreasonable period of non-use creates a presumption of abandonment of water rights and that economic factors requiring the discontinuance of use do not constitute a satisfactory excuse to rebut that presumption. (Nursey-Florida)
W76-06853

BAKER V ORE-IDA FOODS, INC. (ILLEGAL MINING OF AQUIFER UNDER GROUND WATER ACT).
513 P2d 627-637 (Idaho 1973).

Descriptors: *Recharge, *Idaho, *Judicial decisions, *Groundwater mining, *Aquifers, Water rights, Legal aspects, Water law, Legislation, State governments, Water supply, Water utilization, Pumping, Water wells, Groundwater, Withdrawal, Groundwater resources, Water levels, Water conservation penalties(Legal), Water management(Applied).
Identifiers: *Idaho Ground Water Act, Injunctive relief.

Plaintiff groundwater appropriators brought an action against defendant junior groundwater appropriators to enjoin defendants from pumping water from a groundwater aquifer underlying both parties' lands. Plaintiffs contended that defendants were pumping water from the aquifer at a rate greater than the aquifer's recharge rate thereby lowering the water level in the aquifer. The Idaho Supreme Court held that pumping water at a rate which would decrease the water level in the aquifer constituted a 'mining' of the aquifer forbidden by the Idaho Ground Water Act. The court held further that injunction was the proper legal remedy where pumping by defendant was resulting in withdrawals of water from the aquifer at a rate greater than the anticipated recharge rate. (Nursey-Florida)
W76-06854

TYLER V VAN AELST (WATER RIGHT IN CREEK, SUFFICIENT LEGAL RIGHT FOR PERMANENT INJUNCTION AGAINST DISTURBANCE OF CREEK BOTTOM).
512 P2d 760-763 (Wash Ct App 1973).

Descriptors: *Silting, *Adjacent land owners, *Land clearing, *Washington, *Judicial decisions, Water rights, Penalties(Legal), Legal aspects, Diversion, Water utilization, State governments, Water pollution sources, Water pollution effects, Water pollution abatement, Water quality, Water quality control, Land development.
Identifiers: *Injunctive relief.

Plaintiff owners of a water diversion system sought damages and injunctive relief against defendant adjacent land owner. The plaintiffs contended that the defendant's land clearing operations were muddying a creek upstream from their diversion system, and that mud and debris dislodged by the defendant's actions had damaged some of their diversion equipment. The defendant contended that the system owners had not shown damage to a clear legal or equitable right and, therefore, were not entitled to injunctive relief. The Washington Court of Appeals held that the plaintiffs had been granted water rights in the affected creek and that the present disturbance of the creek was only one in a chain of events calculated to disturb those water rights. The court further held that since the record showed a definite possibility that injury would occur to the plaintiffs in the future, injunctive relief was an appropriate remedy. (Nursey-Florida)
W76-06855

HOFF V. EHRLICH (DOMINANT ESTATE'S RIGHT TO DRAINAGE EASEMENT FOR NATURAL AND WASTE WATER ACROSS SERVIENT ESTATE).
511 P2d 523-526 (Colo. Ct. App. 1973).

Descriptors: *Colorado, *Judicial decisions, *Drainage, *Easements, *Surface runoff, Legal aspects, Water law, Water rights, State governments, Adjacent land owners, Penalties(Legal), Drainage, Oysters, Drainage water, Waste water, Natural flow, Running waters, Runoff, Drainage effects, Ditches, Flow.
Identifiers: *Injunctive relief.

Plaintiff dominant estate owners brought an action against defendant servient estate owner to enjoin actions of the defendant which interfered with the natural drainage of water from plaintiffs' land through defendant's land. Defendant contended that he was suffering damage from plaintiffs' waste water and was justified in acting to protect his land by controlling the water flow thereto. The Colorado Court of Appeals held that the plaintiffs had a legal easement over defendant's land for the drainage of surface water flowing in its natural manner. While defendant could take steps to protect his land, he could not cause damage to the plaintiffs by interference with the natural and waste water drain in its natural flow. Finally the court found that injunctive relief was the appropriate legal remedy to prevent the defendant's interference with such flow. (Nursey-Florida)
W76-06856

JACOBUCCI V. DISTRICT CT. IN AND FOR JEFFERSON COUNTY (RIGHTS OF SHAREHOLDERS IN MUTUAL DITCH COMPANY).
541 P2d 667-76 (Colo. 1975). 10 p.

Descriptors: *Colorado, *Condemnation, *Ditches, *Distribution systems, *Water management(Applied), Legal aspects, Judicial decisions, Conveyance, Structures, Water rights, Water contracts, Water law, Water supply, Water conveyance.
Identifiers: *Mutual ditch companies, Indispensable parties.

Petitioner stockholders filed a motion to intervene as defendants in a condemnation suit by the City of Thornton against Farmers Reservoir and Irrigation Company, a mutual ditch company. After this motion was denied, the stockholders petitioned the Colorado Supreme Court. The main issue faced by the Court was whether Farmers' stockholders were indispensable parties to the action. The city premised its contention that they were not on two theories: (1) the position of the shareholders was similar to the positions of stockholders of other companies, and, under corporation law, the company protects the shareholders interest; and (2) the company is acting as a trustee for the benefit of the shareholders. The Court disagreed, finding that shareholders of mutual ditch companies are not similar to other shareholders since mutual companies are formed for the purpose of furnishing water to shareholders and not for profit or hire. Shares of stock in a mutual ditch company, therefore, represent ownership of specific water rights, thus making the shareholders real parties in interest. The Court also rejected the agency theory since the water rights vested in the shareholders, not the company. The petitioners then were allowed to intervene. (Hoffman-Florida)
W76-06857

BAUSCH V. MYERS (NONUSE OF WATER FOR IRRIGATION PURPOSES WHICH CONSTITUTES ABANDONMENT).
541 P2d 817-19 (Ore. 1975). 3p.

Descriptors: *Oregon, *Water rights, *Irrigation water, *Priorities, *Preferences(Water rights), Appropriation, Judicial decisions, Legal aspects, Contracts, Water allocation(Policy), Beneficial use, State jurisdiction, Water law, Water policy, Prior appropriations, Irrigation permits.
Identifiers: Forfeiture(Water rights).

Plaintiff purchasers brought an action against defendant former ranchowner for fraudulently representing that the ranch had specified water rights to irrigate 27 acres, with the inception of these rights dating back to 1950. In western states the date of acquisition of water rights is important since 'early rights' are the last to be curtailed when necessity arises to restrict the use of water. After the sale was consummated, the plaintiffs learned that the state was in the process of cancelling water rights for 20.4 acres because of non-use. After the cancellation the plaintiffs reobtained the rights, but with a purchase date of 1972. This put them first in line if any water curtailment was necessitated. The plaintiffs contended that the defendant was liable for fraudulent misrepresentation by not informing them that the water rights were subject to forfeiture. The trial court dismissed the complaint, however, finding that the defendant had acted by mistake rather than recklessly. In reversing, the Oregon Supreme Court found that the forfeiture of water rights was common knowledge in Oregon. Thus, the failure of defendant to so advise the plaintiffs constituted reckless conduct, making defendant liable for any damages suffered by the plaintiffs. (Hoffman-Florida)
W76-06858

METRO PARK DISTRICT V. STATE DEPARTMENT OF NATURAL RESOURCES (GRANTING OF STATE OWNED TIDELANDS NOT ULTRA VIRES).
539 P2d 854-63 (Wash. 1975). 10p.

Descriptors: *Washington, *Wetlands, *Leases, *Land tenure, *Judicial decisions, Legal aspects, Land use, Real property, Management, Terrestrial habitats, Aquatic environments, Land reclamation, Contracts.
Identifiers: *Land use deeds.

After preliminary negotiations, plaintiff State divided newly created tidelands into three tracts, selling two of them to the defendant park district and granting a use deed to the district for the other tract. After this transaction was completed, the district leased tidelands supposedly in the purchased tracts to a yacht club to build a new clubhouse. After clubhouse construction began, it was determined that the clubhouse was partly situated on the use deed tract. Because the clubhouse facility did not comply with applicable state statutes, the State brought this action to cancel the use deed. Following judgement for the district, the State appealed, contending that the alleged statutory violations by the yacht club were grounds for cancelling the use deed. The State also contended that the granting of the deed by the State Commission for an unauthorized project was an ultra vires

act, and thus void. The Washington Supreme Court disagreed, however, finding that the Commission was legally authorized to issue the deeds. The Court also found that the State was equitably estopped from asserting statutory violations as grounds for the deed cancellation, since the State had actual or constructive knowledge that the district was going to lease the land to the yacht club. (Hoffman-Florida)

PARKE V. BELL (PERFECTION OF WATER RIGHT BY DIVERSION OF SPRING GIVES LAND BENEFITTED AN INTEREST WHICH IS UNAFFECTED BY SUBSEQUENT CONVEYANCE OF LAND ON WHICH SPRING IS LOCATED),
539 P2d 995-99 (Idaho 1975). 5p.

Descriptors: *Idaho, *Ditches, *Spring waters, *Appropriation, *Easements, Maintenance, Water sources, Water rights, Beneficial use, Judicial decisions, Legal aspects, Penalties(Legal), Erosion, Relative rights, Water utilization, Preference(Water rights), Adjacent landowners.

Plaintiff landowners brought an action against defendant landowner for damages allegedly caused to the plaintiffs' land by the defendant's failure to maintain a ditch that transversed the plaintiffs' land. The defendant counterclaimed to establish his right to the use of the water and the ditch easement. The district court entered a judgement and decree for the defendant. On appeal, the plaintiffs contended that the spring waters diverted by the defendant's ditch were private waters owned by them and not subject to appropriation. The Idaho Supreme Court disagreed, finding that the defendant's father had originally owned the land on which the spring was situated. Consequently, when he diverted the spring water to other land for a beneficial purpose, a valid appropriation had taken place and the water right perfected became appurtenant to the receiving land. Thus, the plaintiffs' later acquisition of the land on which the spring was situated did not affect the appurtenant water right in other land which had descended to the defendant. The court also rejected the plaintiffs' contention that the trial court should have awarded them damages for the erosion to their land allegedly caused by defendant's ditch, finding that insufficient evidence had been introduced to negate the possibility that the erosion was solely the result of natural conditions. (Hoffman-Florida)

PROBLEMS UNDER STATE WATER LAWS: CHANGES IN EXISTING WATER RIGHTS,
Colorado State Univ., Fort Collins.
M. D. White.
Natural Resources Lawyer, Vol. 8, No. 2 p. 359-76 (1975). 17 p. OWRT C-6076 (No. 5211)(1).

Descriptors: *Project feasibility, *Water resources development, *Water demand, *Water rights, *Energy, Diversion, Storage, Permits, Appropriation, Consumptive use, Irrigation, Water quality, Downstream, Streams, Reservoirs, Effluents, Jurisdiction, Beneficial use, Navigable waters, Land use.
Identifiers: Navigation servitudes, Compensatory water, Ditch company.

Changing existing water rights for energy development is a difficult undertaking and should be considered only when it is impossible to initiate a new water right. Statuatory prohibitions and self-imposed restructions to water right changes must be considered intially. Then the traditional legal rule is that no right may be changed that will result in injury to others. Possible injuries to water rights themselves include changes in consumptive use, historic use, timing of diversions and return flow, water quality, minimum and maximum stream flows and municipal return flows. Also to be considered in attempting a change of water rights are abandonment and forfeiture statutes, federal reservations, anti-export statutes, the problems of appraisal and conveyancing, navigation servitudes, and interstate stream compacts. State environmental statutes and regulations, such as the 1972 Amendments to the Federal Water Pollution Control Act, the 1970 Clean Air Act, the Safe Drinking Water Act, and the National Environmental Policy Act, should be considered as well. Finally, and perhaps most importantly, land use controls should be carefully studied. (Segall-Florida)

PERSPECTIVES ON OCEAN POLICY; CONFERENCE ON CONFLICT AND ORDER IN OCEAN RELATIONS, AIRLIE, VA., OCTOBER 21-24, 1974.
Johns Hopkins Univ., Washington, D. C. School of Advanced International Studies.
National Science Foundation, 1975. 435 p, 2 fig, 3 dwg, 7 tab, 1 append.

Descriptors: *Oceans, *Water policy, *Law of the sea, *Political aspects, *Foreign countries, Politi-

cal constraints, Research and development, Analytical techniques, Grants, Projects, Negotiations, Foreign waters, United States, Comprehensive planning, International waters, International joint commissions.
Identifiers: *Ocean regime.

To encourage the creation of a comprehensive ocean regime, the Ocean Policy Project was established by the National Science Foundation. Its purpose is to synthesize and analyze various aspects of the new era of ocean politics. Once this step is completed the Project will relate its findings to the various ocean policy options available to the United States. This pursuit of an international treaty covering complex law of the sea issues acceptable to both the United States and foreign nations constitute a unique experiment. While the political structure of the United States may impair the chances of the enactment of such a treaty, it has at least demonstrated that a global perspective is necessary to insure the formulation of a treaty that will adequately protect common community interests. In the author's opinion such a recognition is an essential first step to an effective ocean regime. (See W76-07331 thru W76-07351) (Hoffman-Florida)

THE CARACAS SESSION IN REVIEW: REMARKS ON THE SECOND SESSION OF THE THIRD LAW OF THE SEA CONFERENCE,
J. R. Stevenson.
In: Perspectives on Ocean Policy, p 7-11, National Science Foundation, 1975.

Descriptors: *Law of the sea, *Treaties, *International waters, *International law, *Exploitation, Mineralogy, International commissions, Water resources, Jurisdiction, Economics, Water resources development, United States, Foreign countries, Mining.
Identifiers: Developing countries.

One of the major benefits of the Third Law of the Sea Conference was the drafting of several treaty texts which presented various alternatives in balancing the rights and duties of coastal states pertaining to territorial seas and economic zones. These tests, which were concerned with specific problems, will provide a working paper that should allow for more rapid progress in resolving disagreements. This will be especially true concerning the deep seabed and mineral exploitation draft treaty since it was in this area where the best technical preparation had taken place prior to the Conference. Possibly because of this preparation, there were significant movements by some of the developing countries concerning the exploitation issue. While these countries had previously rejected proposals that would have placed conditions with respect to exploitation, they submitted a draft which would allow a treaty to set basic exploitation conditions. In addition, the draft contemplated the possibility of giving outsiders contractual rights to exploitation, thus reversing the previous stand of the developing countries that called for the International Authority to have monopolistic powers. Although there is still a considerable gulf between the position of the developing and industrial countries relating to deepsea mineral exploitation, the draft texts submitted at the Conference show that there is some flexibility in their positions. THE ROLE OF FORCE IN THE OCEAN,
Kings College, London (England).
L. Martin.
In: Perspectives on Ocean Policy, p 33-44, National Science Foundation, 1975.

Descriptors: *Right-of-way, *Military aspects, *Law of the sea, *Navigation, *Foreign countries, Submarines, Beds, Oceans, Exploitation, Transportation, Ships, Straits, Inland waterways, Bodies of water, International law, International commissions.
Identifiers: Right of passage, Naval operations, Ships(Military).

Although much of the discussion concerning ocean law changes has centered around economic and conservation considerations, there has been speculation as to what effect ocean law changes will have on the future of naval operations. For instance, it is now generally accepted that countries may situate military equipment, except for weapons of mass destruction, on the ocean seabed. Thus, if ocean treaties allocating specific exploitation rights to specific countries in the deep seabed are ratified, serious confrontations could develop between countries having military equipment in an area and countries having exploitation rights in that same area. Potential confrontations could also result if the territorial sea zones are extended. Because of the importance of sea transportation to many countries, it is conceivable that coastal countries might refuse to allow the passage of ships necessary for the prosperity or existence of a hostile state. The coastal states could also refuse to allow the passage of naval warships through their territorial seas. Such power would be especially significant in areas such as the Straits of Tiran where territorial jurisdiction could effectively limit naval entry and operations. Because such limitations and changes could have damaging effects, it is probable that military considerations will play a large role in drafting any future changes in ocean law. (See also W76-07330) (Hoffman-Florida)
W76-07332

COMMENTARY ON THE ROLE OF FORCE IN THE OCEAN,
L. Wells, II.
In: Perspectives on Ocean Policy, p 45-53, National Science Foundation, 1975.

Descriptors: *Military aspects, *International waters, *Political aspects, *International law, *Navigation, Negotiations, Water policy, Decision making, Foreign countries, Right-of-way, Coasts, United States, Ships, Comprehensive planning, Law of the sea.
Identifiers: Military weapons, Naval forces, Coastal states.

Because of fundamental changes in our perspective of the oceans, the usefulness of naval forces in future diplomacy may be very limited. With the advent of intercontinental weapons, the existence of powerful naval forces does not present the great danger it once did. In addition, because of the recent recognition of the vast resources of the ocean, nations will actively resist infringements of their economic zones. Thus, emphasis will be placed on the effectiveness of coastal zone naval operations and not on distant water operations. There has also been a trend by the developed countries, those having the strongest naval forces, to refrain from using those forces because of political implications. Examples of such restraint are the British concessions in the Cod War, and United States inaction in the South American tuna boat disputes. Finally, the highly sophisticated military weapons now in the hands of developing coastal countries can provide ample power to challenge any military vessels in territorial waters. While these factors do not conclusively signal the end to naval influence in ocean policy decision-making, it seems probable that the freedom of naval mobility will be significantly reduced in the future. W76-07333

REGIONAL APPROACHES TO LAW OF THE SEA: THE EUROPEAN COMMUNITY,
M. Hardy.
In: Perspectives on Ocean Policy, p 61-74, National Science Foundation, 1975.

Descriptors: *International law, *Law of the sea, *Regional development, *United Nations, *Political aspects, Treaties, Water policy, Water law, Negotiations, Regional analysis, Foreign countries, Water resources development, Oceans, United States, International commissions.
Identifiers: Regional approach, European Economic Community.

Considerable discussion has centered around the question of whether a 'regional approach' should be adopted by the Conference on the Law of the Sea in attempting to reach agreement on various issues pertaining to the oceans. The essence of the 'regional approach' is that problems pertaining to ocean law should be settled on an area-by-area, ocean-by-ocean approach, instead of a single treaty presenting various solutions to be applied to all ocean areas in the world. Thus, a 'regional approach' conceivably could find that territorial zones should extend farther for Atlantic Ocean coastal states than for Pacific Ocean coastal states. Presently, there appears to be two different kinds of regional approaches. One kind consists of the use of United Nations regional groupings to pursue goals that are widely shared by other members. The other kind involves a wider process of regional integration, the primary example being the European Economic Community (EEC). The EEC is analyzed to show what benefits can be derived from such an approach and to show how its organizational decision-making differs from the first type of regional approach. REGIONAL APPROACHES TO LAW OF THE SEA: LATIN AMERICA,
University of Chile, Santiago.
F. O. Vicuna.
In: Perspectives on Ocean Policy, p 75-86, National Science Foundation, 1975.

Descriptors: *International waters, *Jurisdiction, *International law, *Foreign countries, *Water resources, Mineralogy, Navigation, Commercial fishing, Mexico, Water pollution, Beds, Coasts, International commissions, Oceans, Political aspects, Water policy, Law enforcement.
Identifiers: Territorial sea, Coastal states, Economic zones, Latin America.

Although Latin American countries agree that they should have control over resources within a 200-mile zone from their coast, they and most other states disagree over what power coastal states should exert over these areas. Several countries, including Brazil and Peru, contend that the 200-mile zone is a territorial sea, while other countries, including Mexico, Chile and Argentina, contend that the territorial sea extends only 12 miles, the rest being an economic zone. These two positions have significant differences, since powers over a territorial sea are far greater than those over an economic zone, and encompass the authority to regulate and control navigation and overflight. The Latin American countries are in agreement, however, that all living and mineral resources within the 200-mile zone are to be controlled by the coastal states, irrespective of the geological characteristics of the seabed; furthermore, the coastal states have the jurisdiction to control marine pollution within the 200-mile zone. Because the countries are in agreement on many basic issues, their resolution of the territorial sea dispute could provide a useful insight into arranging other international compromise agreements. However, more than mere agreements among the Latin American countries will be needed, since the interests of other nations, especially commercial fishing nations, will have to be considered in reaching any lasting agreement. W76-07335

REGIONAL APPROACHES TO LAW OF THE SEA: AFRICA,
F. X. Njenja.
In: Perspectives on Ocean Policy, p 87-105, National Science Foundation 1975.

Descriptors: *International waters, *International law, *Jurisdiction, *Coasts, *Foreign countries, Navigation, Water pollution, Straits, Exploitation, Continental shelf, Political aspects, Oceans, Water policy, Law of the sea, *Africa.
Identifiers: Landlocked countries, Coastal states, Territorial sea, Economic zone.

The African delegation to the Law of the Sea Conference consists of forty-one countries. Because of this large number, and because thirteen of those countries are landlocked, there is a wide divergence of interests among the delegation. Nevertheless, the African countries are firmly united on two issues: (1) that to insure the unhampered right of navigation for commercial trade the African countries should have jurisdiction over bordering straits; and (2) that to prevent harmful pollution from ships in the super tanker route around Africa, the African countries should have pollution control jurisdiction over all ships within their national jurisdiction. Beyond these two issues, however, there is considerable disagreement. For instance, twelve of the coastal states claim a twelve-mile territorial sea, while the others claim territorial seas ranging from eighteen to two hundred miles. It is too early to tell if these different territorial sea zones will prevent a general uniform law concerning powers of jurisdiction since it is conceivable that some countries may exercise varying degrees of control over areas within their territorial jurisdiction. Other areas of African disagreement center around jurisdictional controls over the economic zone and the continental shelf, and around the rights of landlocked countries in the exploitation of the ocean. W76-07336

THE NORTH-SOUTH SPLIT AND THE LAW OF THE SEA DEBATE,
Overseas Development Council, Washington, D.C.
R. D. Hansen.
In: Perspectives on Ocean Policy, p 109-134, National Science Foundation 1975.

Descriptors: *Law of the sea, *International law, *Political aspects, *Foreign countries, *Treaties, Economics, Economic impact, Continental shelf, Water resources, Political aspects, Oceans, Water policy, Exploitation, Coasts, Navigation.
Identifiers: Developing countries, Developed countries, Landlocked countries, Economic zones, Territorial seas, Coastal states.

When economic interests are examined, it would appear that a clean North-South split at the upcoming law of the sea conference is unlikely. While the developing and developed countries would both like to maximize their gains, there is a significant disagreement within each bloc on vital law of the sea issues. For instance, landlocked countries of the northern bloc generally want territorial seas and economic zones to be limited. The northern coastal states, however, have made it clear that an expansive economic zone is a top priority. As to the southern bloc, there is considerable internal disagreement over such issues as continental shelf jurisdiction, 'Seabed Authority' powers, and the economic rights of landlocked countries. Nevertheless, it has been suggested that any final treaty will have to be acceptable to all of the developing countries. Such a viewpoint seems to have been correct as to the Caracas session of the Conference. There the southern bloc stalled on all serious negotiations on major issues because they had been unable to achieve internal agreement. This desire for solidarity was best exemplified by southern support of OPEC oil price increases, despite the devastating effect of those increases on some southern countries. Whether this southern desire for solidarity can overcome basic economic differences is a question that remains unanswered. (See also W76-07330) (Hoffman-Florida)
W76-07337

COMMENTARY ON THE NORTH-SOUTH SPLIT AND THE LAW OF THE SEA DEBATE,
Department of State, Washington, D.C. Office of the Assistant Legal Adviser for Ocean Affairs.
T. Leitzell.
In: Perspectives on Ocean Policy, p 134-138, National Science Foundation, 1975.

Descriptors: *Negotiations, *Water policy, *Law of the Sea, *International law, *Political constraints, Institutional constraints, Economic impact, Environmental control, Treaties, Political aspects, Water resources development, Jurisdiction, Foreign countries, Oceans.
Identifiers: Bloc negotiations, Developing countries, Economic zones.

Bloc negotiations have often proved to be a stumbling block to the successful formulation of international agreements. Because most nations are acting in their own national economic interests, however, the Law of the Sea Conference has not been characterized by such East-West or North-South splits. Possibly this lack of a distinct split has been because the Soviet Union and the United States have adopted similar stands on a number of issues. Whatever the reason, it now appears that most issue disagreement has been the result of economic considerations. For instance, the developing countries have been more concerned with restrictions on economic development than with provisions relating to environmental protection. Their position has shifted during negotiations, however, as they realize that environmental protection will also ultimately benefit them. The developed countries have also had some shifting positions as emphasis has been placed on the real interests of opposing sides rather than on bloc politics. Acceptance of a 200-mile economic zone by the developed countries, who had previously resisted such a concept, is a prime example of putting real economics ahead of politics. While difficult and complex issues remain to be resolved, the chances of enacting a successful treaty appear good if bloc positions on politicized issues can be avoided. W76-07338

ENVIRONMENTAL POLICY AND THE OCEAN,
Johns Hopkins Univ., Washington, D.C. School of Advanced International Studies.
C. S. Pearson.
In: Perspectives on Ocean Policy, p 207-219, National Science Foundation 1975.

Descriptors: *International waters, *International law, *Oceans, *Water pollution control, *Compensatory payment, Waste disposal, Administration, Economics, Cost-benefit analysis, Ships, Navigation, Water quality standards, Foreign countries, Political aspects, International commissions.
Identifiers: Ocean Dumping Convention, Convention on the Prevention of Pollution from Ships, *Ocean dumping.

Two recent conventions on marine pollution, the Ocean Dumping Convention and the Convention on the Prevention of Pollution from Ships, have addressed the question of whether international agreements can be reached pertaining to the enactment of pollution control measures stringent enough to protect the ocean environment. The greatest stumling block to such an agreement has been a reluctance on the part of countries to unilaterally limit ocean waste disposal without assurance that other countries will take the same action. The key to encouraging such unilateral pollution abatement could possibly come from an international agreement calling for international compensation for damages caused by ocean pollution. Because such a proposal would be difficult to administer and enforce, the Ocean Dumping Convention makes no mention of pollution compensation. Instead, it gives individual countries wide discretion in establishing ocean dumping criteria so that a beneficial cost-benefit result can be maintained. The Pollution from Ships Convention on the other hand, while also ignoring compensation provisions, is not nearly so general, and presents specific provisions pertaining to equipment and operating instructions. Whether such provisions will be effective in the absence of a compensation mechanism remains to be seen. (See also W76-07330) (Hoffman-Florida)
W76-07339

ALTERNATIVE APPROACHES TO ORDER: TREATY AND NON-TREATY APPROACHES TO ORDER IN THE WORLD OCEAN,
Louisiana State Univ., Baton Rouge. Law School.
H. G. Knight.
In: Perspectives on Ocean Policy, p 251-272, National Science Foundation 1975.

Descriptors: *Exploitation, *Water resources, *International law, Oceans, *Political aspects, Political constraints, Legislation, Law of the sea, Fisheries, Fish management, Fish conservation, Mining, Water pollution, Water resources development, Foreign countries.
Identifiers: *Deepwater ports.

To prevent conflicts over exploitation rights pertaining to the ocean's resources nations of the world are attempting to draft an agreement on law of the sea issues which will have world-wide acceptance. Because of numerous factors, however, it is unlikely that such an agreement will be reached at the upcoming Law of the Sea Conference. Some of these factors include: the leak of a single draft; the size and complexity of the Conference; the 'package deal' and 'gentleman's agreement' approach; the lack of political decisions; and the existence of political orientation. Because of the probable failure of the Conference, it is suggested that the United States adopt domestic legislation on a wide number of law of the sea issues which will protect national interests but which will also set a legislative example to be followed by other countries. For instance, on the issue of fisheries management and jurisdiction, legislation could be enacted that would provide for the protection of coastal species of fish while at the same time minimizing potential international conflicts over acceptable catch limits. Such legislation could also be enacted pertaining to seabed mining, deepwater ports, and pollution. While such legislation will not solve all problems, it will help provide a basis for future international negotiations. (See also W76-07330) (Hoffman-Florida)
W76-07340

ALTERNATE APPROACHES TO ORDER: INTERNATIONAL OCEAN ORGANIZATION AND THEIR REGULATORY FUNCTIONS,
American Society of International Law, Washington, D.C.
D. A. Kay.
In: Perspectives on Ocean Policy, p 281-300, National Science Foundation 1975.

Descriptors: *Regulation, *Coordination, *International waters, *International commissions, *Fish management, Commercial fishing, Fish stocking, Fish harvest, International law, Law of the sea, Fish populations, Comprehensive planning, Foreign countries, Political aspects, International joint commissions.

Because of an increasing awareness of the wealth of the living and non-living resources of the ocean, the regulatory functions of international ocean or-

ganizations have assumed a major role in United Nations (UN) activities. Currently, however, most international regulation of fishing is achieved through regional commissions outside of the UN system. Such regulatory schemes often fail to coordinate effectively the major aspects of the fishing problem and thus often fail to meet the conflicting expectations of member nations. For example, the following regulatory problems exist concerning the fishing issue: entry into the fishery; the long term cost calculus of a common resource; control over the size of the catch; control over ship construction leading to overcapitalization; and uncertainty as to the population dynamics of the fish stock. When one organization takes steps to correct problems in one of these areas without giving consideration to the effects its decision will have on other aspects of the fishing problem and on other nations outside of the organization, the potential for future conflicts is greatly increased. Consequently, to achieve maximum results from fish regulation, some type of regulatory body should be formed which will have the authority to develop a norm creating, cost allocating regulatory system. (Hoffman-Florida)
W76-07341

COMMENTARY ON: ALTERNATE APPROACHES TO ORDER: INTERNATIONAL OCEAN ORGANIZATION AND THEIR REGULATORY FUNCTION,
South Carolina Univ., Columbia.
H. Silverstein.
In: Perspectives on Ocean Policy, p 301-307, National Science Foundation 1975.

Descriptors: *Coordination, *Organizations, *International law, *Law of the sea, *Data transmission, Administrative agencies, Water policy, Professional societies, Decision making, Administration, Foreign countries, Data storage and retrieval, Data processing, Water policy.
Identifiers: International organizations.

International organizations will play an important role in implementing international agreements pertaining to law of the sea issues. Several obstacles must be overcome, however, before such organizations can achieve their full potential. First, it is essential that there be improvement in information processing technology. The current structure provides too much information of limited usefulness and not enough information on vital issues, such as the scientific aspects of the fisheries issue. Secondly, international organizations should refrain from attempting to coordinate national programs with incompatible objectives. Most organizations are currently perceived in state-centric terms. Such a perception may no longer be valid with the development of inter-intergovernmental organizations, such as the Long-term and Expanded Program of Oceanic Research (LEPOR). Another factor leading to the obsolescence of a state-centric approach is that nations are not unified actors; i.e., they often engage in behind-the-scene efforts to block the official objectives of their delegations. Because of these factors, the roles of international organizations may need to be redefined effectively to carry out their functions. (See also W76-07330) (Hoffman-Florida)
W76-07342

COMMENTARY ON: ALTERNATE APPROACHES TO ORDER: INTERNATIONAL OCEAN ORGANIZATIONS AND THEIR REGULATORY FUNCTIONS,
American Society of International Law, Washington, D.C.
R. Stein.
In: Perspectives On Ocean Policy, p 308-311, National Science Foundation 1975.

Descriptors: *Law of the sea, *International law, *Oil pollution, *Economic impact, *Water pollution control, Exploitation, Treaties, International waters, Ships, Economics, Water quality control, Environmental control, Environmental effects, Foreign countries, Political aspects.
Identifiers: Economic zones, Environmental impact statements.

Environmental issues have generally been pushed into the background at recent international Law of the Sea Conferences. Even the issue of oil pollution by ocean vessels, an issue which has received considerable public attention, has been largely ignored as developing countries have resisted any moves to place restrictions on economic development. While several general treaty provisions have been proposed concerning vessel pollution, they have generally contained broad warnings that any pollution control measures taken must be compatible with the individual state's need for economic progress. In effect, these proposals give no guarantee of the implementation of effective pollution control measures. There have also been useful proposals presented pertaining to impact statements or environmental safeguards related to resource exploration and exploitation within economic zones. Unless specific treaty proposals are formulated on these and other environmental issues, little success on environmental issues can be expected from future Law of the Sea Conferences. GEOGRAPHY AND THE LOS DEBATE: PROTECTION OF COASTAL STATE INTERESTS VERSUS THE PRESERVATION OF INTERNATIONAL INTERESTS,
Canadian Embassy, Vienna (Austria).
J. A. Beesley.
In: Perspectives on Ocean Policy, p 335-342, National Science Foundation 1975.

Descriptors: *International joint commissions, *Foreign countries, *Law of the Sea, *Fisheries, *International waters, International law, Federal jurisdiction, Commercial fish, Water law, Jurisdiction, Commercial fishing, Political aspects, Coasts, Water resources development.
Identifiers: Coastal states, Marine environment, State sovereignty.

Because few nations want total freedom or total sovereignty with respect to law of the sea issues, the possibility of international management presents a viable alternative. Such an international management would have to be developed gradually, since most international relations are based on the principle of state sovereignty. For example, most coastal states have decided that the best way to protect fishing interests off their coast is through state jurisdiction over the waters. This does not rule out the possibility, however, of an international management agreement whereby coastal rights could retain certain rights, while at the same time acquiring certain duties and responsibilities. Such an agreement, which would attempt to insure a balance between national and international interests, would help promote international cooperation by: aiding in the maintenance of peace and security; furthering the preservation and improvement of the marine environment; contributing to world economic stability; narrowing the gap between developed and developing nations; and conserving the living and non-living resources of the ocean. Before such international agreements can come into effect, though, countries must resist the impatient pressure for unilateral action. (See also W76-07330) (Hoffman-Florida)

COMMENT ON: GEOGRAPHY AND THE LOS DEBATE: GEOGRAPHICAL FACTORS AND THE PATTERNS OF ALIGNMENT,
Columbia Univ., New York. School of Law.
L. Henkin.
In: Perspectives on Ocean Policy, p 342-349, National Science Foundation 1975.

Descriptors: *Foreign countries, *Water resources, *International law, *Military aspects, *Law of the sea, *Water law, Economics, Water policy, Jurisdiction, Navigation, Mineralogy, Water resources development, Political aspects, Coordination, Environmental effects, Coasts.
Identifiers: Coastal states, Territorial sea, Maritime states.

The economic need for living and non-living ocean resources has exerted great pressure upon coastal states to extend their 'contiguous zone' jurisdiction. Such an expansion would have met great resistance several years ago when the traditional concepts of freedom of the seas was generally accepted. Due to significant changes in military technology, in the attitudes of maritime states, and in the political system, however, resistance to coastal state expansion has been significantly weakened. Whether this expansion will enhance national interests at the expense of international interests is a question open to much speculation. It is suggested that this expansion will have adverse effects on international relations since it increases the area for potential conflicts and may increase the potential for unjustifiable interference with foreign activities by coastal states. In addition, unilateral actions by coastal states have generally been undertaken to protect the national interest with little thought given to their effects on the international community. International agreements on contiguous zone jurisdiction, on the other hand, could provide ample protection for coastal states while at the same time minimizing potential conflicts with other nations. (See also W76-07330) (Hoffman-Florida)

CONGRESS AND A LAW OF THE SEA TREATY,
S. C. Pell, and E. F. Hollings.
In: Perspectives on Ocean Policy, p. 365-76, National Science Foundation 1975

Descriptors: *Foreign countries, *Law of the sea, *International waters, *International law, *Water resources development, Navigation, Fisheries, Continental shelf, Continental margin, United States, Mineralogy, International commissions, Jurisdiction, Economics, Coasts, Comprehensive planning, Treaties, Water law, Military aspects, Political aspects.
Identifiers: Coastal nations, Economic zone, Territorial sea.

The desire of the developing countries, which form a bloc called the Group of 77, to present a unified position on law of the sea issues has seriously impeded international negotiations. Consequently, if some type of international agreement can not be reached the United States should consider well-planned unilateral action on a number of important issues such as navigational freedoms, fisheries, the international sea-bed area, and the continental shelf. Regarding navigational freedoms, it is suggested that the question of access to resources by navigational means should no longer be controlled merely by military considerations, but should be judged on its own merits. In the international seabed area, a policy should be established that encourages fair access and investments in deepsea minerals and which prevents monopolistic controls by any international organization. The United States has also proposed that a 200 mile economic zone be established giving coastal states preferential fishing rights, and that coastal states be given resource jurisdiction over the continental shelf to encourage the production of oil resources. While unilateral action to enact these goals is a secondary choice to international agreement, its viability as a workable alternative should not be overlooked. (See also W76-07330) (Hoffman-Florida)

FUTURE PROSPECTS FOR LAW OF THE SEA: COMMENTS ON CARACAS AND PREDICTIONS FOR THE FUTURE,
Woodrow Wilson International Center for Scholars, Washington, D. C.
A. Pardo.
In: Perspectives on Ocean Policy, p. 383-405, National Science Foundation 1975.

Descriptors: *Law of the sea, *Baseline studies, *Islands, *Jurisdiction, *Coasts, Navigation, Straits, International waters, International law, Negotiations, Political aspects, Continental shelf, Water resources, Development, Foreign countries.
Identifiers: Economic zone, Territorial sea, Land locked countries, Coastal states.

Several different proposals concerning the limits of coastal state sovereignty or jurisdiction in the oceans were set forth at the Law of the Sea Conference. The first question addressed by these proposals involved the setting of baselines defining coastal state jurisdiction. On this question there was little disagreement, with the great majority of states favoring the archipelagic principles for drawing baselines. There was considerable disagreement, however, on the territorial sea or economic zone jurisdiction of islands. Under previous international law, when territorial sea jurisdiction was very narrow, it was generally thought that the marine jurisdiction of islands was determined in the same way as for large land masses. With the introduction in recent years of the 100-mile economic zone, this position has come under attack, and many nations now favor denying jurisdictional rights to foreign dominated islands lying within the economic zone of another country. Whether such a view will be adopted by the Conference is uncertain. Several other areas of disagreement at the Conference described in this article include: the nature and scope of coastal states' powers within the economic zone; ocean rights in land-locked states; and navigational rights through straits within territorial seas. COMMENTARY ON: FUTURE PROSPECTS FOR LAW OF THE SEA: COMMENTS ON CARACAS AND PREDICTION FOR THE FUTURE,
Woodrow Wilson School of Public and International Affairs.
S. McIntyre.
In: Perspectives on Ocean Policy, p. 406-408, National Science Foundation 1975.

Descriptors: *Law of the sea, *International law, *Treaties, *International waters, *Foreign countries, Navigation, Straits, Military aspects, Negotiations, Water policy, Policy aspects, Water resources development, Treaties, Coordination.
Identifiers: Archipelagos, Unilateral action, Coastal states, Economic zone.

Despite the pessimism of many commentators, the desire of nations to avoid international conflict should result in a treaty at the Law of the Sea Conference. Although this treaty will probably leave several important issues unanswered, it should make an important contribution by emphasizing international action instead of unilateral action. As to specific issues, the treaty will probably define archipelagic waters in such a way as to allow the unimpeded transit of military vessels. Such a provision is not assured of passage, however, as many commentators and nations feel that advance notification will be required of military vessels seeking passage through straits. As to scientific research within the economic zone, the treaty will probably not require the consent of coastal states, despite the insistence of a bloc of states who favor such a consent regime. Whatever decisions are made on this and other issues, the Law of the Sea Conference should prove to be a stepping stone for more productive international negotiations in the future. COMMENTARY ON: FUTURE PROSPECTS FOR LAW OF THE SEA: COMMENTS ON CARACAS AND PREDICTION FOR THE FUTURE,
R. Faggioli.
In: Perspectives on Ocean Policy, p. 408-10, National Science Foundation 1975.

Descriptors: *Continental shelf, *Law of the sea, *International law, *Exploitation, *Navigation, Continental margin, Ships, Navigable waters, Monitoring, Economics, Jurisdiction, Beds under water, Income, Royalties, Payment, Coasts, Political aspects, Foreign countries.
Identifiers: Coastal states, Economic zones, Territorial sea, Revenue-sharing.

Extension of coastal state jurisdiction over the seabed and the right of transit for commercial vessels should be primary issues at the Law of the Sea Conference. As to coastal state jurisdiction, the position of most nations seems to favor jurisdiction to the seaward edge of the continental margin. Disagreement appears to be developing, however, as to what powers should be vested in the international authority which will be charged with overseeing exploitation of the ocean. In addition, there is uncertainty as to whether revenue-sharing by the international community in exploitation revenues derived from the continental margin will be mandatory or optional. If some type of revenue-sharing is required, royalty percentages will have to be determined. As to commercial transit, the primary question is whether vessels will be allowed unhampered transit through economic zone waters. It is suggested that any monitoring or interference rights granted to coastal states would seriously disrupt world economic trade and could provide a fertile source for international conflict. The answer to this issue will probably hinge on what enforcement rights are granted to coastal states over areas outside their territorial sea but within their economic zone. COMMENTARY ON: FUTURE PROSPECTS FOR LAW OF THE SEA: COMMENTS ON CARACAS AND PREDICTION FOR THE FUTURE,
S. Levering.
In: Perspectives on Ocean Policy, p. 410-14, National Science Foundation 1975.

Descriptors: *International law, *Law of the Sea, *International waters, *Foreign countries, *Water resources, Environmental control, Commercial fishing, Fish management, Mining, Monitoring, Navigation, Exploitation, Negotiations, Decision making, Political aspects, Water resources development.

Although matters pertaining to economic zones and territorial seas have drawn considerable attention, the real importance of the Law of the Sea Conference will be how its decisions affect the future of mankind. Because of the abundance of living and non-living resources within the ocean, decisions relating to their exploitation will have long lasting effects. Unfortunately, the positions of most nations on law of the sea issues center around short sighted nationalism. Serious restrictions might, therefore, be placed on the free movement of commercial vessels and on scientific research. In addition, there will probably be little international monitoring concerning environmental protection and fish conservation. Nevertheless, there is a good chance of getting a treaty that will produce some beneficial results. There is hope, for example, of creating an international organization which will exercise environmental functions pertaining to deep seabed mining. The biggest stumbling block to the creation of such an organization will come in the delineation of the scope and nature of the duties to be given the organization. The hopes for an acceptable solution to this issue, as well as countless others, will depend on large part on the willingness of nations to be flexible in negotiating acceptable compromises. FUTURE PROSPECTS FOR LAW OF THE SEA: THE FUNCTIONAL APPROACH AND THE LAW OF THE SEA,
J. N. Moore.
In: Perspectives on Ocean Policy, p. 421-28, National Science Foundation 1975.

Descriptors. *Water resources development, *Foreign countries, *Water policy, *Oceans, *Institutional constraints, Water resources, Management, Coordination, Law of the sea, Negotiations, International law, International waters, Political aspects, United States, Coasts, Continental shelf.
Identifiers: Ocean policy, Territorial sea, Unilateral action.

Two alternatives are available for the United States to achieve its ocean policy. The first choice involves working out an international agreement of numerous law of the sea issues at the upcoming Conference in Caracas. The second choice involves the passage of domestic legislation which will provide for unilateral action at home and abroad concerning ocean policies. It is suggested that the road to unilateralism will result in disastrous results. Because unilateral action is usually designed to protect national self-interest it will greatly increase the potential for international conflict in the world's oceans. In addition, it might result in worldwide fragmentation, thereby preventing the formulation of international treaties necessary to effectively coordinate and manage the vast resources of the ocean. International agreements, on the other hand, have already laid basic guidelines on several law of the sea issues, such as a 200 mile economic zone and a twelve mile territorial sea. While there are still complex issues to be worked out within these guidelines, their eventual solution will result in a uniform and international law. While such solutions will require flexibility in individual nation's bargaining positions, it is the only alternative compatible with the development of an international community common interest. CURRENT DEVELOPMENTS IN DEEP SEABED MINING,
Hearings--Sub. Comm. on Minerals, Materials and Fuels Comm. on Interior and Insular Affairs, U.S. Senate, November 7, 1975, 1-249.

Descriptors: *Mining, *Financing, *International law, *Mining engineering, *Coasts, Oceans, Costs, Cost analysis, Federal Government, Beds, Construction costs, Economic feasibility, Foreign countries, Forecasting, International water, Metallurgy, Risks.
Identifiers: Federal Ocean Mining Administration, Domes Project.

Hearings were held before the Senate Subcommittee on Minerals, Materials and Fuels concerning current developments in the ocean mining industry, and the need for federal legislation to protect the industry's capital expeditures in case of international control and intervention. Subjects covered included nodule deposits providing for satisfactory mine sites, metallurgical problems of winning metals from nodules, and mining systems which have been developed to implement the project. Doubts as to economic feasibility and success no longer exist. The remaining problem is obtaining capital to finance each project, projected costs

of which range upwards of $300 million per project. Although present law permits uninhibited exploration and development the typical financing pledge extends at least 10 years. In view of the demonstrated desire of the international community to establish controls over such activity, the present absence of political sponsorship and security of tenure constitute an unacceptable business risk to financial institutions. Mining companies rely upon external debt financing. Representatives from financial institutions suggest that proposed bill S.713 if passed would provide the necessary inducements and assurances for security of tenure and freedom of operations even if the controversial licensing program is eliminated and only insurance and investment guarantees remain. MARINE PROTECTION, RESEARCH, AND SANCTUARIES ACT OF 1972.
Hearing--Subcomm on Oceans and Atmosphere, Comm on Commer, US Senate, 94th Cong, 1st Sess, May 20, 1975. 79 p.

Descriptors: *Oceans, *Water quality control, *Waste disposal, *Regulations, *Federal Government, Legislation, Legal aspects, Water law, Water pollution, Water pollution sources, Water pollution control, Water pollution abatement, Water quality, Environmental effects, Dredging, Sea water, Oceans, Permits, Economics, Economic impact, Organizations, Water pollution effects, Pollutants, Wastes.
Identifiers: Congressional hearings, Coastal water.

The Senate Subcommittee on Oceans and Atmosphere held a hearing to review and appraise the activities of Federal agencies responsible for carrying out the Marine Protection, Research, and Sanctuaries Act of 1972. The hearing concentrated on the regulation of dumping of all types of materials into ocean waters. Testimony was received from representatives of the Army Corps of Engineers, the Environmental Protection Agency (EPA), the U.S. Coast Guard and the Department of Commerce. This testimony primarily concerned E.P.A. dumping regulations and the functions of each of the represented organizations in administering and enforcing them. The representative of the Army Corps of Engineers stated that the dumping regulations have created economic hardship and suggested that disposed of dredged materials at ocean sites should not be substantially limited, especially since research showed such dumping to have minimal environmental impact. OUTER CONTINENTAL SHELF LANDS ACT AMENDMENTS AND COASTAL ZONE MANAGEMENT ACT AMENDMENTS.
Joint Hearings----Comms. on Interior and Insular Affairs and Commerce, U.S. Senate, April 8, 9, 1975, p 697-1745.

Descriptors: *Oil fields, *Exploration, *Exploitation, *Leases, *Continental shelf, *Natural gas, Oil, Drilling, Geologic formations, Fossil fuels, Fuels, Oil wastes, Oil pollution, Locating, Offshore platforms, Surveys, Test wells, Oil spills, Engineering, Energy.
Identifiers: Congressional hearings, Coastal zone management.

These proposed amendments concern leasing policy changes for the outer continental shelf mineral deposits, principally oil and gas deposits. Principal bills discussed are S.130, S.426, S.521 and S.586. Major areas of concern include: (1) the advisability of exploration by the federal government as opposed to private industry; (2) possible competition promotion through lower initial cash bonuses and higher royalty payments; (3) possible delays in exploration and exploitation due to state opposition to offshore drilling; and (4) the advisability of adopting one or more of the proposed programs for economic assistance to affected states. An analysis and comparison of the bill provisions under discussion is included in the report. In addition the report presents two research studies, the American Petroleum Institute annual report on environmental research for 1975 and the National Advisory Committee on Oceans and Atmosphere report to the Secretary of Commerce regarding ocean engineering. (Comer-Florida)
W76-07354

LEGISLATION FOR OUTER CONTINENTAL SHELF R AND D.
Hearings--Sub Comm. on Energy Research, Development, and Demonstration--Comm. on Science and Technology, US H R, July 8, 9, 10, 11, 1975, p. 833-1721.

Descriptors: *Continental shelf, *Oil industry, *Leases, *Safety, *Pollution, Oil, Natural gas, Oceans, Marine geology, Oil wastes, Oil pollution, Natural resources, Oil fields, Exploitation, Exploration, Secondary recovery(Oil), Royalties, Drilling, Federal government, Planning legislation, Pipelines, Systems analysis, Resources, Water law, Administration.
Identifiers: Congressional hearings, Administrative regulations.

Five appendices have been submitted to the Subcommittee on Energy Research by various organizations. Appendix I contains information submitted by the Department of the Interior, including a list of secondary and tertiary recovery projects on federal lands, tables of royalty and production information, and regulations pertaining to mineral leasing, operations and pipelines on the Outer Continental Shelf (OCS). Appendix II consists of supplements to the Report of the Work Group on OCS Safety and Pollution Control. Appendix III is made up of reports to the United States Geological Survey on OCS petroleum operations. The reports focus on the following issues: (1) program planning to assure safety and pollution control; (2) application of systems analysis techniques to offshore oil and gas operations; (3) inspection strategies for use in the OCS; (4) standards development for OCS operations; and (5) methods for determining the condition of existing pipelines. Appendix IV presents proposed legislation relating explicitly to research and development of the OCS bills considered by the Subcommittee. The final appendix provides additional information on particular OCS research activities concerning resource assessment, leasing, and environmental programs, as well as diving safety and hydrocarbons in OCS waters. ENVIRONMENTAL LAW IN THE USA: II,
A. Wharam.
New Law Journal, Vol. 125, p. 547-48 (1975). 2 p.

Descriptors: *Legislation, *History, *Environmental control, *Federal Water Pollution Control Act, *Clean Air Act, Environmental engineering, Environment, Planning, Judicial decisions, Regulation, Administration, Governments, Legal aspects, Water resources development, Water law, Air pollution, Federal government, Federal jurisdiction, Navigable waters, State governments.

The current body of American environmental law was developed both through the United States' judicial system and through recent comprehensive legislation. The courts' early attempts to establish federal jurisdiction over navigable waters extended first to the issue of navigability and then on to issues of pollution and its control. By comparison, initial attempts to regulate pollution through federal legislation proved largely impractical, primarily because enforcement was left up to the states. Recently, however, more sweeping legislation has been passed to control both water and air pollution. The Federal Water Pollution Control Act and the Clean Air Act have given powers of enforcement to the Environmental Protection Agency to eliminate pollutant discharges into navigable waters along with powers to establish primary and secondary standards to protect the public from adverse effects of air pollution. States are required to implement plans in conformity with federal standards with allowance made for any state whose internal standards are more stringent than those required by federal regulations. (Welch-Florida)

ACHIEVING FEDERAL-STATE COORDINATION IN COASTAL RESOURCES MANAGEMENT,
Louisiana State Univ., Baton Rouge. Sea Grant Legal Program.
M. J. Hershman.
William and Mary Law Review, Vol. 16, No. 4, p. 747-72 (1975). 26 p.

Descriptors: *State governments, *Coasts, *Coastal engineering, *Planning, *Inter-agency cooperation, Federal-state water rights conflicts, Federal jurisdiction, Federal government, State jurisdiction, Decision making, Coordination, Interstate, Water policy, Political aspects, Organizations, Environmental control, Environment, Management, Water pollution control, Washington, California, Louisiana, Water law, Legislation.
Identifiers: *Coastal Zone Management Act.

Various levels of government become involved in determining resource issues under the Coastal Zone Management Act (CZMA). Problems arise between state and federal levels due to the various national and local resource allocation plans and differing ideas concerning national interest in resources. The article analyzes four major facility developments along with CZMA provisions concerning federal-state relations. The four facilities examined are: (1) Trident Submarine Base, Bangor, Washington; (2) Outer continental shelf (OCS) oil and gas leasing, California; (3) Deepwater Port, Louisiana; and (4) OCS oil and gas leasing, East Coast. Each state's coastal management program differs in its influence over major facility developments and in its decisionmaking competence, indicating the need for allocation of responsibilities. Recommendations include development of an ongoing coordination process subprogram housed outside the primary decision-making unit to consider national interest and federal consistency issues. In this manner federal dominance may be avoided by allowing state and local governments to apportion resource use and balance competing interests. (Welch-Florida)
W76-07359

THE CONCEPT OF STATE AND LOCAL RELATIONS UNDER THE CZMA,
National Oceanic and Atmospheric Administration, Washington, D.C.
W. C. Brewer, Jr.
William and Mary Law Review, Vol. 16, No. 4, p. 717-29 (1975). 13 p.

Descriptors: *State governments, *Water resources development, *Planning, *Inter-agency cooperation, *Coasts, Coastal plains, Coastal marshes, Governments, Management, Geographical regions, Beaches, Coastal engineering, Regions, Seashores, Shores, Coordination, Decision making, Land management, Power operation maintenance, Water management(Applied), Administration, Legislation, Social aspects, Political aspects, Federal government.
Identifiers: *Coastal Zone Management Act.

Effective operation of the Coastal Zone Management Act (CZMA), which prescribes minimum relationships for the state-locality relationship, depends upon a complex of rights and duties linking a state with its municipalities. Though united geographically, the CZMA is the first attempt to move from a specialized response to a general planning management for a large geographic area. Responsibility for making detailed land use decisions is placed at the state level rather than with the municipality, but program contributions are to be made by all levels of government. State control over actions of regional and statewide significance need only be modest to result in federal monetary support of state coastal zone programs. The state must select its methods, support them with specific and adequate legislative authority, and set forth the means for control and review in the coastal zone management program. The state thus can limit its participation in local affairs to a review function only while still insuring consistency with the program. (Welch-Florida)

PENNSYLVANIA PUBLIC TRUST DOCTRINE: ITS USE AS A RESTRAINT ON GOVERNMENT,
Duquesne Univ., Pittsburgh, Pa. School of Law.
R. C. Lane.
Duquesne Law Review, Vol. 13, p. 551-76 (1975). 25 p.

Descriptors: *Water policy, *Common law, *Pennsylvania, *Public lands, *Public rights, Public access, Public benefits, Legal aspects, Constitutional law, Permits, Water rights, Water control, Water law, Preferences(Water rights), Administrative decisions, Common law, Governments, Judicial decisions, Law of the sea, Legal review, History, Aesthetics.
Identifiers: *Public trust doctrine.

In 1971, by constitutional amendment, the Commonwealth of Pennsylvania adopted the public trust theory of natural resource management. While the public trust doctrine had previously been part of Pennsylvania's common law, it applied exclusively to waterways and the submerged land thereunder. The constitutional article imposes upon the state, as trustee, the duty to conserve and maintain all the public natural resources of the state. As a common law principle, the doctrine was struck down by the courts only when governmental action was violative of a specific public right, so that any change in the use of public lands or action which lessened the use of such lands was impermissible without a showing of legislative approval. The constitutional trust doctrine reaffirms the police power to regulate the use of land with aesthetic and historic consideration in mind; thus, both new powers and obligations are imposed upon the state. Whether the constitutional amendment standing alone is self-executing has yet to be definitively answered by the courts. Since the doctrine precludes the state from granting to others the right to use public lands in any way that would violate the equitable rights of the public, the limits placed upon the state's right to grant permits in this area is unclear. (Welch-Florida)

ENVIRONMENTAL LAW - STATUTORY INTERPRETATION - THE ENVIRONMENTAL PROTECTION AGENCY ENTERS THE NUCLEAR AGE -- COLORADO PUBLIC INTEREST RESEARCH GROUP, INC. V. TRAIN 507 F2D 743 (10TH CIR. 1974),
Suffolk Univ., Boston, Mass. Law School.
J. A. Christopher.
Suffolk University Law Review, Vol 9, p. 1512-23 (1975). 12 p.

Descriptors: *Federal Water Pollution Control Act, *Radioactive waste disposal, *Water quality control, *Environmental effects, *Nuclear wastes, Nuclear powerplants, Powerplants, Nuclear energy, Thermal pollution, Water pollution sources, Disposal, Radioactive wastes, Waste treatment, Water pollution, Electric powerplants, Water quality control, Federal government, Judicial decisions.
Identifiers: *FWPCA Amendments of 1972.

A recent Tenth Circuit case, Colorado Public Interest Research Group, Inc. v. Train, resolved whether the Environmental Protection Agency (EPA) was responsible for the regulation of certain nuclear material discharged into navigable waters. Under the Federal Water Pollution Control Act Amendments of 1972 the EPA issued regulations specifically excluding regulatory responsiblity for nuclear material claiming that the Atomic Energy Act of 1954 placed responsibility for regulating the discharge of nuclear material in the Atomic Energy Commission (AEC). The court held the Amendments of 1972 to be inconsistent with the duties of the AEC and thus implicitly divested the AEC of such responsibility. The EPA radioactive material exclusions were so significant that the court found they would completely emasculate the statute's general policy. In holding the EPA responsible for the regulation of nuclear byproduct discharges, the court departed from the previously accepted atomic energy control methods and made an affirmative commitment toward pollution control in navigable waters. (Welch-Florida)
W76-07362

CANADIAN APPROACH TO THE THIRD LAW OF THE SEA CONFERENCE,
New Brunswick Univ., Fredericton. Law School.
C. C. Emanuelli.
University of New Brunswick Law Journal, Vol. 24, p. 3-28 (1975). 26 p.

Descriptors: *Continental shelf, *International waters, *Canada, *Law of the sea, *International law, Water law, Legal aspects, Navigation, Oceans, Coasts, Continental shelf, International commissions, Federal government, Foreign waters, Treaties, Water treatment, Pollution abatement, International bound and water commissions, Conferences, Water rights, Water quality, Fishing, Fish conservation, Fisheries.

The Canadian position with respect to the Third Law of the Sea Conference is typical of a coastal nation. Canada sees an urgent need for change in the principle of freedom of the high seas and in the principle of exclusive jurisdiction of the flag state. Canada has developed the concept of custodianship, that coastal states have a special interest and responsibility with regard to the protection of the marine environment and should act as custodians of that environment. An extreme application of this doctrine is embodied in Canada's proposal for the adoption of economic zones extending from coastal mainlands even farther than the custodianship zone. Canada also advanced specific proposals in these areas: (1) pollution; (2) fisheries management and exclusive fishing zones; (3) continental shelf definition and extent of rights therein; and (4) seabeds. The author sees the Canadian proposals, as granting coastal states new rights and powers rather than new responsibilities. (Welch-Florida)

THE RED SEA LIGHTS AGREEMENT: ANOTHER INSTANCE OF INTERNATIONAL COST-SHARING,
Bureau of Economic and Business Affairs, (State), Washington, D.C. Office of Maritime Affairs.
J. M. Garner.
American Journal of International Law, Vol. 69, No. 1, p 129-34 (1975). 7 p, 1 chart.

Descriptors: *Lighthouses, *International waters, *Cost allocation, *Navigation, *Ships, Economics, Operating costs, Oceans, Foreign countries, Canals, International law, Oil, Routing.
Identifiers: *Red Sea, *Suez Canal, *Tonnage, United Kingdom, Turkey.

When Turkey renounced its interest in two islands in the Red Sea, there was doubt as to who would obtain jurisdiction over the two navigational lights located on the islands. Because these lights provided an essential service to commercial vessels, twelve nations entered into an agreement whereby they would provide the funds necessary to maintain and operate the lights. Under this agreement, each participating nation's share of the cost is assessed in the proportion that the tonnage of its vessels using the lights bears to the total tonnage of all participating governments using the lights. This tonnage use will be based on transit statistics maintained by the Suez Canal. Although the agreement provides for no organizational structure, it does appoint the United Kingdom as the managing government in charge of collecting contributions and of preparing estimated annual expenses. Unfortunately, the closing of the Suez Canal drastically reduced the usefulness of the lights so that the tonnage figures for the first five months of 1967 had to be used for determining assessments. With the opening of the Canal in 1974, however, a new rate base is likely to be devised. The key question is whether the Red Sea waterway will reattract the petroleum cargoes it lost when the canal was closed. (Hoffman-Florida)

REPORT OF THE OCEAN POLICY RESEARCH WORKSHOP,
Rhode Island Univ., Kingston. Law of the Sea Inst.
R. L. Friedheim, and J. T. Kildow.
Law of the Sea Institute Occasional Paper Series, No. 26, July 1975. 47 p.

Descriptors: *Water resources development, *United States, *Water policy, *Non-structural alternatives, *Oceans, Project planning, Project purposes, Regulation, Water law, Surface waters, Navigation, Oceanography, Sea water, Information exchange, International waters, International commissions, Investigations, Data collections, Planning, Feasibility, Surveys.

In February 1975, a group of scholars, analysts and government officials interested in ocean policy attended the Research Applied to National Needs (RANN) Ocean Policy Research Workshop. The workshop's goals were to assess the art of research relating to ocean policy, determine the degree of consensus about the status of ocean policy, and propose a research agenda and methods to create a U. S. ocean policy. Workshop discussions ranged over broad areas of ocean policy but centered upon the ocean enclosure movement, policies flowing from this movement, the problems of doing ocean policy research within the context of the U. S. political system, and the need to improve policy research. The main marine policy research topics suggested by the workshop were: (1) National Ocean Institutions; (2) International and Transnational Ocean Institutions; (3) Ocean Transportation and Communication; (4) Exploitation and Management of Ocean Resources; (5) Ocean Environmental Protection; and (6) Ocean Scientific and Technological Information. The workshop emphasized the need to concentrate on the identification and analysis of emergent problems as well as opportunities for long-range policy guidance. (Welch-Florida)
W76-07367

CONTEMPORARY LAW OF THE SEA: TRANSPORTATION, COMMUNICATION AND FLIGHT,
Rhode Island Univ., Kingston. Law of the Sea Inst.
W. T. Burke.
Law of the Sea Institute Occasional Paper Series, No. 28, Nov. 1975. 38 p.

Descriptors: *Water resources development, *International waters, *Coasts, *Foreign countries, *Law of the sea, International law, Legal

aspects, Oceans, Water law, Navigation, Trespass, Regulation, Transportation, Boats, Ships, Canals, Communication water rights, Boundary disputes, Competing uses, Federal jurisdiction, Jurisdiction.

With increased ocean traffic, disputes arise over access to nearshore areas more and more distant from the coast and over the competence of coastal states to apply policy regulations in these areas. Areas of particular concern include internal waters, archipelagos, the territorial sea, ocean areas adjacent to the territorial sea, and use of the high seas for transportation and communication. Policy considerations include the desire to protect ocean resources but also to use the ocean as a resource for all, subject to necessary accommodations with adjacent coastal states. The author recommends a reformulation of the concept of innocent passage through the territorial sea, a formulation which include the interests of the coastal state while reducing the degree of discretion permitted by the present innocent passage concept. The author also examines the policies in each area of concern along with an appraisal of recent trends and recommendations for future planning and action. (Welch-Florida)

THE 1973 JAPANESE LAW FOR THE COMPENSATION OF POLLUTION RELATED HEALTH DAMAGE: AN INTRODUCTORY ASSESSMENT,
Hawaii Univ., Honolulu.
J. Gresser.
5 ELR 50229-51 (1975). 23 p.

Descriptors: *Foreign countries, *Compensation, *Air pollution effects, *Water pollution effects, *Pollution taxes(Charges), Legislation, Public health, Pollutant identification, Cost analysis, Economics, Legal aspects.
Identifiers: *Japan, *Tort liability.

Under recently enacted Japanese legislation, citizens may receive compensation payments for pollution-related illnesses upon certification by a special Health Damage Council. The burden of such payments is borne by the polluters who must contribute funds to a national pool based on a graduated emission charge and a tonnage tax on automobiles. An overview of the cultural-institutional setting, legal foundations, and basic mechanics of the Act is presented. Up until 1968, judicial interpretations of 'duty of care' and 'foreseeability' posed major obstacles to tort relief for Japanese plaintiffs. Then, however, the first of four major pollution trials took place affording a very broad reading to the various requirements for tort liability. These decisions were to give great impetus to compensatory legislation. The legislation itself has several major aspects, including: (1) designation of toxic substances; (2) designation of pollution zones; (3) designation of pollution victims; (4) assessment of victims costs and expenses; (5) determination of a budget; and (6) an allocation of cost. Although the actual effectiveness of this legislation will not be known for years, American pollution policy-makers should take careful note of the results. (Hoffman-Florida)

JUDICIALLY ENFORCEABLE RIGHTS UNDER NATIONAL ENVIRONMENTAL POLICY ACT,
California Univ., Livermore. Lawrence Livermore Lab.
J. C. Wharton.
Available from the National Technical Information Service, Springfield, Va 22161 as UCRL-51828. UCRL-51828 (May 1975). 41 p, 2 append.

Descriptors: *Legislation, *Environmental control, *Legal review, *Federal government, Judicial decisions, Adjudication procedure, Administrative agencies, Administrative decisions, Adoption of practices, Legal aspects, Legal review, Penalties(Legal), Water law, Decision making, Water rights, Administration, Institutions, Regulation, Environment, Law enforcement.
Identifiers: *National Environmental Policy Act.

This report evaluates judicially enforceable rights under the National Environmental Policy Act (NEPA). Early legal resistance to NEPA was based upon the idea that NEPA afforded no justi ciable rights. In Calvert Cliff's Coordinating Committee v. Atomic Energy Commission, however, the reviewability of federal administrative action was upheld absent a clear showing of contrary Congressional intent. The issue of substantive compliance with NEPA was the issue most frequently litigated. Other issues the courts have attempted to resolve include that of substantive review and the sufficiency or adequacy of the required impact statement. The standards of review used by the courts have been confusing and inconsistent. Even though court action has been unpredictable, the trend has been for the courts to act and even halt plans where there has been a fulfillment of an EIS with full disclosure but where environmental destruction has been threatened. Court decisions have thus accorded NEPA appropriate weight in the federal agency decision-making process. (Welch-Florida)
W76-07370

CRITERIA FOR THE IDENTIFICATION OF AREAS OF ENVIRONMENTAL CONCERN PREPARED FOR NORTH CAROLINA LAND POLICY COUNCIL.
North Carolina Land Policy Council, Raleigh.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 432, $5.75 in paper copy, $2.25 in microfiche. 1974. 129 p, 9 fig.

Descriptors: *North Carolina, *Forecasting, *Long-term planning, *Design criteria, *Comprehensive planning, *Decision making, Water resources development, Air pollution, Water pollution, Alternative planning, Recreation, Beaches, Wildlife habitats, Wetlands, Tidal marshes, Estuarine environment, Public access, Right-of-way, Resources, Beach erosion, Dunes, Floodways, Environmental control.
Identifiers: Coastal waters, Public trust doctrine, Resource limited areas, Flood hazard areas, Dynamic zones, Park zones.

This document recommends technical definitions for areas of 'Environmental Concern' under current or proposed State legislation. The introduction explains the concept and application of areas of environmental concern as one strategy in State land policy development. Subsequent sections provide technical criteria, explanation of significance, and current techniques for identifying 46 types of areas. Section B encompasses physiographic areas, including wetlands, flood hazard areas, areas of scenic quality, dynamic zones, recreational areas, earth resource limited areas, forest resource limited areas, water and air quality limited areas, and wildlife habitats. Section C covers sites of developmental concern, including key facilities, large scale developments and reservoirs. Section D applies to lands in public trust. Appendices suggest policy alternatives for various areas and discuss methods of aggregating data into an information system. (Reinders-Florida)
W76-07371

AMENDMENT TO SUBDIVISION CODE 62.
Hawaii County, Hawaii, Amending Subdivision Code 62, Rev. Ordinances (1967). 2 p.

Descriptors: *Building codes, *Flood control, *Construction, *Hawaii, *Flood plain zoning, Flood plains, Flood profiles, Regulation, Water zoning, Non-structural alternatives, Overflow, Floodways, Legislation, Decision making, Flood damage, Rain water, Rainfall-runoff relationships, Storm runoff, Storm water, Surface runoff, Legal aspects, Maps.

This amendment to the Hawaii County, Hawaii Subdivision Code No. 62 establishes further procedures to be followed in the design and approval of subdivisions located in 'F' Flood Hazard areas which are subject to inundation by rain or sea water. The submitted drainage map must include all waterways in the area plus the approximate location of areas subject to possible inundation or storm water overflow. No map approval will be granted if the area is found to be unsuitable for the proposed use by reason of its proneness to inundation until protective improvements have been taken by the subdivider and have been approved. Structures located in an 'F' District must be constructed to withstand flooding action, and new utilities must be constructed to minimize or eliminate flood damage. All water systems must be floodproofed and gate values must be installed in all water mains crossing into the 'F' District. Any sewage disposal facility proposed for such District shall not be approved if the system requires soil absorption and could not function due to high ground water or flood condition. (Welch-Florida)
W76-07372

AMENDMENT TO ZONING ORDINANCE 63.
Hawaii County, Hawaii, Amending Zoning Ordinance 63, Rev. Ordinances (1967). 2 p.

Descriptors: *Building codes, *Flood control, *Construction, *Hawaii, *Flood plain zoning, Flood plains, Floods, Regulation, Water zoning, Permits, Structures, Non-structural alternatives, Floodways, Flood damage, Legislation, Maps, Storm water, Storm runoff, Rain water overflow, Legal aspects, Structural design.

This amendment to the Hawaii County, Hawaii Zoning Ordinance No. 63 establishes further conditions for construction within an 'F' Flood Hazard District which is subject to inundation by rain or sea water. These regulations apply to areas designated by the Federal Insurance Administration as areas subject to special flood and tsunami hazards. Each zone map must specify the elevation of the flood level by a numerical suffix after the letter 'F'. Use permits for any structure in an 'F' District shall not be issued unless construction standards used in the structure eliminate or reduce the potential flood and tsunami danger. All new residential construction or substantial improvements shall have the lowest floor, including the basement, elevated to or above the level of the 100-year flood, or together with the attendant utility and sanitary facilities shall be waterproofed up to the level of the 100-year flood. (Welch-Florida)
W76-07373

ORDINANCE AMENDING BUILDING CODE ORDINANCE 501.
Hawaii County, Hawaii, amending Building Code Ordinance 501, Rev. Ordinances (1967). 1 p.

Descriptors: *Flood plain zoning, *Flood damage, *Hawaii, *Building codes, *Construction, Design criteria, Design standards, Flexible foundations, Legislation, Regulation, Standards, Safety factors, Flood plains, Water zoning, Storm water, Floods, Legal aspects, Structural design, Construction materials.

This amendment to the Hawaii County, Hawaii, Building Code Ordinance No. 501 establishes further procedures which must be followed in the design of all buildings or structures to be located within an area designated as an 'F' Flood Hazard District being subject to inundation by rain water or sea water. If a proposed building site is located within such an F District where it may be exposed to extreme water heights or possible wave forces, then appropriate construction designs must be adopted to prevent flotation, collapse or latteral movement of the structure. All materials and equipment used must also be resistant to any possible flood damage. (Welch-Florida)
W76-07374

AMENDMENT TO PLUMBING AND GAS CODE 502.
Hawaii County, Hawaii, amending Plumbing and Gas Code 502, Rev. Ordinances (1967). 3 p.

Descriptors: *Building codes, *Flood control, *Hawaii, *Plumbing, *Flood plain zoning, Pipes, Sewers, Sanitary engineering, Construction, Construction materials, Structural design, Design flood, Water zoning, Regulation, Design standards, Legislation, Drainage systems, Drainage districts, Drainage, Valves, Floods, Waste water disposal, Water districts.

This amendment to the Hawaii County, Hawaii, Plumbing and Gas Ordinance No. 502 specifies further construction regulations for buildings and structures which are located within an 'F' Flood Hazard District subject to inundation by rain water or sea water. All plumbing within such an F District must meet both the provisions of the plumbing code and those which have been added by this amendment. In the event the two provisions conflict then the amendment shall prevail. The new provisions require installation of an approved reduced pressure back flow prevention device at various locations in a water supply system within an F District. Regulations concerning drainage have also been amended and stringent requirements for sumps and receiving tanks have been imposed. They must be watertight and constructed of concrete, metal or an approved material and must be treated both internally and externally to resist corrosion. All drainage piping which serves fixtures below the second floor or the maximum expected flood level shall discharge only into an approved sump or receiving tank which itself must be so located as to receive the sewage or wastes by gravity. (Welch-Florida)
W76-07375

AMENDMENT TO ELECTRICAL CODE ORDINANCE 568.
Hawaii County, Hawaii, amending Electrical Code Ordinance 568, Rev. Ordinances (1967). 2 p.

Descriptors: *Building codes, *Flood control, *Hawaii, *Electric wires, Electrical engineering, Electrical equipment, Electrical wiring, Electric power failure, Flood plain zoning, Flood plains, Regulation, Construction, Design standards, Legislation, Structural design, Electric insulation, Electric terminals, Conductors, Switchgear, Watertight, Water proofing.

This amendment to the Hawaii County, Hawaii, Electrical Code Ordinance No. 568 specifies further provisions required in the construction of buildings in a designated 'F' Flood Hazard District identified as being subject to inundation by rain water or sea water. This amendment supplements the requirements of the National Electrical Code for all electrical work done in an area subject to inundation. All service equipment must be located above the estimated inundation level or must be installed in readily accessible water-tight enclosures; i.e., the water-tight construction must exclude moisture and be able to withstand the hydraulic pressure expected from the estimated depth of inundation. All feeder and branch circuits in such an 'F' District must also have approved ground fault circuit production. Any distribution equipment must likewise be located above the anticipated inundation level or be of water-tight construction. (Welch-Florida)
W76-07376

TANKER HYGRADE NO. 18 V. UNITED STATES (NO RECOVERY FOR CLEAN-UP COSTS RESULTING FROM OIL SPILL IN NAVIGABLE WATERWAYS).
526 F2d 805-12 (Ct. Cl. 1975). 8 p.

Descriptors: *Oil spills, *Navigable waters, *Compensation, *Negligence, *Third party effects, Oil pollution, Oil wastes, Boats, Legal aspects, Judicial decisions, Legislation, United States, Costs, Cleaning.
Identifiers: Clean-up costs, Corporations, Tort liability.

Plaintiff barge owner brought an action seeking to recover clean-up costs resulting from an oil spill in a navigable waterway. The plaintiff contended that the spill was caused by the negligent action of one of two accompanying tug boats. Since the spill was allegedly caused by a third party, the plaintiff was seeking reimbursement from defendant United States pursuant to a federal statute. The Court of Claims rejected the plaintiff's argument, however, finding that the discharge had not been caused solely by the acts of a third party. The court noted that one of the two tugboats charged with negligence was a wholly-owned subsidiary of the same parent company as the plaintiff. To prevent the avoidance of tort liability through the corporate shell, the court viewed the barge owner and the tug owner as one entity. For the plaintiff to recover, it was necessary to prove that the other tugboat was the sole cause of the accident. This issue, however, had already been decided in another court proceeding which had determined that the second tug was not the sole cause of the spill. Under the cumulative effect rule, the plaintiff was precluded from relitigating the causation issue and thus could not comply with the statutory requirement for recovery. (Hoffman-Florida)
W76-07377

IN THE MATTER OF FLOWERS (DUTY OF CARE OF BARGE OWNER AND DOCK OWNER DURING SEVERE FLOODING OF MISSISSIPPI).
526 F2d 242-45 (8th Cir. 1975). 4 p.

Descriptors: *Barges, *Docks, *Negligence, *Floods, *Mississippi River, Wharves, Legal aspects, Accidents, Judicial decisions, Ships, Missouri, Navigable waters, Rivers, Navigation.
Identifiers: Bailments, Reasonable care.

Plaintiff barge owner brought an action seeking damages allegedly caused by defendant quarry operator's failure to exercise reasonable care in assuring that the plaintiff's barge would not break away from its wharf during a severe flood. The trial court found that both the barge owner and the dock owner must exercise reasonable care when use of docking facility is for the mutual benefit of both parties. On appeal, the plaintiff contended that a bailment relationship existed and, therefore, the bailer-defendant should be presumed to be negligent unless it could show that the breakaway was not its fault. The Eighth Circuit expressed doubt as to whether a bailment relationship existed; furthermore, the court found the contention to be untenable in that sufficient proof had been introduced by the defendant to question the validity of the inference. Since the plaintiff had introduced no evidence of his own to prove negligence, the court held that the plaintiff had not met his burden of proof and affirmed the lower court's decision for the defendant. (Hoffman-Florida)
W76-07378

NIAGRA MOHAWK POWER CORP. V. UNITED STATES (POWER COMPANY'S RIGHT TO USE NAVIGABLE RIVER FOR POWER PURPOSES A PROPERTY RIGHT).
525 F2d 1380-91 (Ct. Cl. 1976). 10 p.

Descriptors: *Taxes, *Water rights, *Water contracts, *Power plants, Judicial decisions, Federal jurisdiction, Regulation, Property values, Navigable rivers, Legislation, Electric powerplants, State governments, New York.
Identifiers: *Property rights.

Plaintiff power company was seeking a federal income tax refund arising out of a disallowance of deductions for the obsolescence of water rights. Under the applicable state law prior to 1957 the power company's right to use the water was a recognized property right of indefinite duration. In 1957, however, legislation was enacted requiring a state power authority (PASNY) to undertake a redevelopment project. Under this legislation the plaintiff was to surrender its water use license in return for a contract that required PASNY to sell plaintiff the amount of power previously generated by the plaintiff. In 1961, this contract was accepted. Because it alleged that the water rights were made obsolete by the 1957 legislation, the plaintiff contended it should be allowed to deduct the value of those rights over the period 1957-1962. The court rejected this contention, finding that the rights were not made obsolete but were merely transferred to PASNY. Although the deduction was disallowed, the court found that the plaintiff was entitled to a loss on the exchange of the water rights for the contract rights. Thus, the case was remanded with instructions to allow a loss deduction if the basis of the water rights were found to have a value greater than the contract rights received in exchange. (Hoffman-Florida)
W76-07379

COASTAL PETROLEUM CO. V. UNITED STATES (NAVIGATION SERVITUDE INCLUSIVE OF LIMESTONE RIGHTS IN CENTER OF LAKE).
524 F2d 1206-12 (Ct. Cl. 1975). 7 p.

Descriptors: *Navigable waters, *Limestones, *Leases, *Dredging, *Water rights, Flood protection, Navigation, Mining, Exploitation, Legal aspects, Judicial decisions, Eminent domain, Compensation, Constitutional law, Levees, United States.
Identifiers: *Navigation servitude.

Plaintiff corporation was the lessee of a lease authorizing the mining of limestone from the bottom of a navigable lake. Subsequent to this lease, the defendant United States dredged limestone from an area encompassed by the lease to use in the construction of a levee on the lake. The plaintiff then brought this action seeking compensation for the limestone removed. The defendant sought a summary judgment, contending that any taking by the federal government was non-compensatory by reason of its navigation servitude. Although admitting the existence of such a servitude, the plaintiff contended that the taking right was limited to actions in aid of navigation and did not extend to actions aimed at achieving flood control. The Court of Claims, while accepting this general contention, found that the distinctions between flood control actions and navigational actions are not always clear. Here the project involving the dredging of the lake was to be considered 'authorized as a whole'. Consequently, since the levee project was governed by the navigation servitude, any limestone dredging incident to the main work was both authorized and non-compensatory. Summary judgment was then rendered for the United States. (Hoffman-Florida)
W76-07380

H. K. PORTER CO. V. BD. OF SUPERVISORS (ACCRETIONS NOT CONTIGUOUS TO PRIVATE PROPERTY BELONG TO STATE),
324 So2d 746-55 (Miss. 1975). 10 p.

Descriptors: *Accretion(Legal aspects), *Mississippi, *Land tenure, *Eminent domain, *Property rights, Leases, Compensation, Judicial decisions, Legislation, Legal aspects, Land use, Land classification, State jurisdiction, Rivers, Islands.
Identifiers: Property deeds.

Plaintiff landowner brought an action to confirm title to a tract of property it had acquired from defendant port authority and seeking title by accretion to an adjoining tract of land. After the trial court found the plaintiff to be the owner of the

original tract and the state to be the owner of land claimed by accretion, both sides appealed. Co-defendant state of Mississippi contended that the deed from the port authority contained a covenant that required the land to be used for industrial purposes. Since the land was no longer so used, the defendants argued that they should be able to reacquire the land for public purposes upon payment of reasonable compensation. They also alleged that the deed was void since statutory requirements pertaining to the transfer of state land had not been met. The Mississippi Supreme Court agreed with the defendants that the deed was void. Furthermore, under the defendants' power of eminent domain the land could be reacquired since the plaintiff no longer used the land for industrial purposes. The Supreme Court also went against the plaintiff as to the lands claimed by accretion, holding any accretion to a body of land arising from deposited spoils dredged from a bay and not contiguous to private property belongs to the state. (Hoffman-Florida)
W76-07381

AMERICAN IRON AND STEEL INSTITUTE V. EPA (EPA POER TO REGULATE EFFLUENT LIMITATIONS UNDER FEDERAL WATER POLLUTION CONTROL ACT),
526 F2d 1027-78 (3d Cir. 1975). 52 p.

Descriptors: *Cost analysis, *Industrial wastes, *Water quality control, *Effluent, *Federal Water Pollution Control Act, Discharge(Water), Water pollution sources, Regulation, Administration, Administrative agencies, Administrative decisions, Economics, Steel, Industrial water, Pollution abatement.
Identifiers: Administrative authority, Point source(Pollution), FWPCA Amendments of 1972.

Petitioner trade association and steel companies brought an action seeking a review of regulations promulgated by the Administrator of the Environmental Protection Agency pertaining to effluent limitations for point sources in the iron and steel manufacturing industry. The petitioner's basic challenge was that the Administrator was not authorized to promulgate such limitations under the Federal Water Pollution Control Act Amendments of 1972. Even if the Administrator does have such power, petitioners contended that the regulations failed to constitute valid guidelines in that they did not provide meaningful ranges in considering individual factors. In addressing petitioner's first contention, the court was concerned with the interrelationship of key sections of the Act. While acknowledging that the Act does not provide specific authorization to establish single number effluent limitations for existing point sources, the court held that the Administrator's authority to set such limitations can be inferred from section 301. The court went on to remand the case, however, finding that some of the regulations did not constitute valid guidelines. The court also found that the cost element involved in the guidelines had not received sufficient consideration effects the guidelines would have on investment decisions. (Hoffman-Florida)
W76-07382

PORT OF COOS BAY V. CITY OF COOS BAY (TERMINATION OF WATER SERVICE TO BAY WITHIN REASONABLE EXERCISE OF POLICE POWER WHEN BAY CONTAMINATED AND THERE IS A REFUSAL TO USE ANTI-BACKFLOW DEVICE).
541 P2d 156-60 (Ore. Ct App 1975).

Descriptors: *Oregon, *Judicial decisions, *Potable water, *Public health, *Regulation, Legal aspects, Water law, Local governments, State governments, Penalties(Legal), Water quality, Water quality control, Public utilities, Mechanical equipment, Freshwater.
Identifiers: Injunctive relief, Police power.

Plaintiff municipal corporation brought an action to enjoin defendant city and the municipal water board from terminating water service to the plaintiff. The defendants contended that the water service was terminated because the plaintiff had failed to comply with city regulations requiring the installation of reduced pressure anti-backflow devices in its main water connections. The plaintiff contended that this regulation was an unreasonable exercise of the police power. The Oregon Court of Appeals refused to grant the injunction, holding that the regulation requiring the installation of devices to protect the public health was a reasonable regulation within the scope of the police power. (Nursey-Florida)
W76-07383

WATKINS V COBB COUNTY COMMISSION (NO LIABILITY FOR PERFORMANCE OF GOVERNMENT FUNCTION SUCH AS CONSTRUCTION, INSTALLATION AND MAINTENANCE OF SEWER-DRAINAGE SYSTEM),
217 SE2d 298-304 (Ga. Ct. App. 1975).

Descriptors: *Georgia, *Judicial decisions, *Local governments, *Sewage disposal, *Overflows, Legal aspects, Water law, State governments, Adjacent land owners, Negligence, Penalties(Legal), Sewage effluents, Waste disposal, Drainage systems, Waste water.
Identifiers: Sovereign immunity, Nuisance(Legal aspects).

Plaintiff landowner brought an action against defendants county commission and developer for damages caused by sewage overflowing onto his land. The plaintiff contended that while the developer was making a tie-in from its condominiums to the county sewage system, some sealant got into the tie-in, blocking the sewer system which then overflowed onto the plaintiff's land. The Georgia Court of Appeals affirmed a summary judgement in favor of the county commission. The court held that the county could not be held liable for negligence because the maintenance of a sewer-drainage system is an immuse governmental function. The court further held that the county commission could not be held liable on a theory of nuisance because the condition was abated promptly by the county commission. (Nursey-Florida)
W76-07385

CITY OF PASCAGOULA V. RAYBURN (NO MUNICIPAL LIABILITY FOR DAMAGE BY UNPRECEDENTED RAINFALL CAUSING OVERFLOW OF DRAINAGE DITCH AND SUBSEQUENT DWELLING HOUSE DAMAGE),
320 So2d 378-82 (Miss. 1975). 5 p.

Descriptors: *Rainfall-runoff relationships, *Mississippi, *Ditches, *Overflow, *Drainage, Water conveyance, Judicial decisions, Legal aspects, Watercourses(Legal aspects), Damages, Accidents, Negligence, Hazards, Safety, Maintenance, Maintenance costs, Obstruction to flow, Barriers, Municipal water, Suburban areas, Rainfall, Rainfall intensity.

Plaintiff home owners brought this suit against defendant city to recover for damages to their home and furnishings due to the alleged negligence of the defendant in failing to maintain a drainage ditch near their home. The plaintiffs contended that the defendant allowed the ditch to become obstructed and to overflow even after the plaintiffs complained before the city council. The city argued it was not negligent since it maintained the ditch in the customary and accepted manner for that area, and that the overflow resulted from an unprecedented and unforeseeable rainfall. The Mississippi Supreme Court held that the defendant was not liable for damages which could not be guarded against by the exercise of reasonable care even though it was under a duty to properly maintain its drainage ditches and remove any obstructions within a reasonable time after obtaining actual or constructive knowledge. Here it was shown that the defendant took action after each complaint by the plaintiffs and thus was not liable for damages. (Welch-Florida)
W76-07386

GULF OIL CORP V. STATE MINERAL BOARD (NAVIGABLE WATER BOTTOMS HELD IN TRUST BY THE STATE FOR THE PUBLIC),
317 So2d 576-605 (La. 1975). 30 p p.

Descriptors: *Royalties, *Oil, *Louisiana, *Navigable waters, *Ownership of beds, Beds under water, Riparian rights, Streambeds, Legal aspects, Judicial decisions, State governments, Royalties, Costs, Income, Patents, Payment, Public lands, Public rights, Constitutional law, Oil industry, Administrative agencies, Beds.

Plaintiff corporation brought a concursus proceeding for determination of which adverse claimants were entitled to oil royalty payments derived from ownership rights in submerged land beneath navigable water. The private litigants in the proceeding claimed ownership of the land from a purchase made in 1910 and from a state patent issued in 1911. The state claimed beds of navigable water are owned by the state and cannot be alienated except by the authority of the public themselves. The Louisiana Supreme Court held that a statute providing that all suits to annul any patent must be brought within six years of issuance was intended only to cure formal defects in the patents and not to ratify absolutely null conveyences. The court found no original authority to transfer title to navigable water bottoms; thus there could be no ratification of any attempt to create title in another even where the patent was signedby the governor. The court further held that any grant of title to such water bottom made prior to a constitutional provision precluding such transfers must be made in express and specific language and will not be implied. In this case where the law relating to ownership was in a state of flux the royalties accumulated prior to the proceeding were ordered paid to the private parties with subsequent royalties to be paid to the state. (Welch-Florida)
W76-07387

WILLIAMS V. DUKE POWER CO. (NO LIABILITY FOR SILTING OF POND AND STREAM BY DESTRUCTION OF VEGETATION ON RIGHT OF WAY),
216 SE2d 482-87 (NC Ct. App. 1975). 6 p.

Descriptors: *Negligence, *North Carolina, *Streams, *Silting, *Deposition(Sediments), Right of way, Legal aspects, Powerline carriers, Electric power plants, Adjacent landowners, Silts, Water pollution control, Damages.

Plaintiff landowners brought action for damages against defendant power company, contending the company had negligently cut and cleared a right of way for a transmission line. The plaintiffs alleged that, as a result of this negligence, soil and debris entered and silted a stream on the plaintiffs' land. A jury verdict was rendered for defendant. On appeal, the plaintiffs put forth several assignmens of error, all of which involved the trial judge's rulings concerning there competency and admissibility of certain testimony. The appellate court rejected these contentions, however, and affirmed the trial court's decision. (Hoffman-Florida)
W76-07388

STATE V. GRIFFITH (REQUIREMENT TO HAVE TIDELAND TITLE: CONVEYANCE TO LOW WATER MARK),
216 SE2d 765-67 (SC 1975). 3 p.

Descriptors: *Ownership of beds, *South Carolina, *Wetlands, *Land tenure, *Boundaries(Property), High water mark, Water

rights, Water level fluctuations, Judicial decisions, Legal aspects, Boundary disputes, State governments, Real property, Streams, Tides.
Identifiers: *Tidelands.

Plaintiff State of South Carolina brought an action to settle a dispute with defendant landowner concerning title to certain tidelands. The State contended that it was the presumptive owner of the tidelands in question, and that no evidence had been introduced to negate that presumption. The defendant landowner contended that he had obtained title to the tidelands by virtue of a grant from the Lords Proprietors in 1717. The trial court entered a verdict for the defendant. The South Carolina Supreme Court reversed, holding that sufficient evidence had not been introduced to show that the grant had conveyed title to the tidelands since there was no language in the grant signifying an intent to convey title to any land below the usual high water mark. Consequently, it was necessary for the defendant to introduce additional evidence that would establish this intent. Since no such additional evidence was presented the court declared that title to the tidelands belonged to the State. (Hoffman-Floria)
W76-07389

STATE V YELSEN LAND COMPANY, INC. (REQUIREMENT OF CONVEYANCE OF TITLE TO LOW WATER MARK TO HAVE TIDELAND TITLE),
216 SE2d 876-79 (SC 1975). 4 p.

Descriptors: *South Carolina, *Wetlands, *Land tenure, *Real property, *High water mark, Water rights, Judicial decisions, Legal review, Legal aspects, State jurisdiction, Inlets(Waterways), Tidal waters, Water level fluctuations, Boundaries(Property), Boundary disputes, Low water mark.
Identifiers: *Tidelands.

Plaintiff State brought this action to settle a dispute with defendant claimants concerning title to certain tidelands. The State contended that it was the presumptive owner of the tidelands in dispute and that no evidence had been introduced to negate that presumption. The two defendant land companies, on the other hand, contended that they had obtained title to the tidelands by virtue of grants from the State. The trial court entered a verdict for the State. On appeal the South Carolina Supreme Court agreedwith the State that the burden of proof was on the defendants to affirmatively prove title to the tidelands. Since the claims of the two defendants were based upon seperate claims of title, the court considered each claim independently. The Court noted that one defendant's claim was based on a state grant conveying land bounded by an 'inlet' and 'sound or creek'. The court rejected this claim, however, holding that such descriptive language insufficent by itself to prove an intent to grant title beyond the high water mark. The Court also rejected the other defendant's similar claim, holding that the granting of land bounded by the 'Atlantic Ocean and the waters of Charleston Harbor' did not prove an intent to convey title to the low water mark. (Hoffman-Florida)
W76-07390

SCOTT V STATE HIGHWAY COMMISSION (SCENIC EASEMENT UNDER SCENIC WATERWAYS ACT),
541 P2d 516-22 (Ore. 1975). 7 p.

Descriptors: *River systems, *Oregon, *Scenic easements, *Condemnation, *Eminent domain, Scenery, Aesthetics, Regulation, Condemnation value, Judicial decisions, Rivers, Reasonable use, Non-structural alternatives, Water policy, Wild rivers, Constitutional law, Adjacent land owners.
Identifiers: State police power, *Scenic Waterways Act.

The Oregon Department of Transportation, pursuant to authority granted under the Scenic Waterways Act, denied plaintiff land owner permission to build two homes on land adjacent to a river. The plaintiff then brought a suit for damages alleging that the defendant State had taken her land without compensation. The trial court dismissed the complaint, on appeal, the plaintiff contended that the term 'scenic easement' in the Act described the right to regulate the use of adjacent land automatically acquired by the state. The plaintiff also contended that the provisions of the Act could only be exercised under the power of eminent domain, and not under the state police power. The Oregon Court of Appeals rejected both contentions, however, and affirmed the trial court decision. Although agreeing that the use of the term 'scenic easement' would support the plaintiff's contention, the court noted that if two statutory constructions are possible, the statute should be construed so as to uphold its constitutionality. Consequently, the court held that an easement was not involved in the state's right to regulate use of the adjacent land. As to the plaintiff's second contention, the court held that the state police power encompasses the right to regulate the use of private property if such regulation is needed to prevent harm to the public interest. (Hoffman-Florida)
W76-07391

NEAL V. HUNT (MINING OF WATER ALLOWED IN ABSENCE OF SHOWING OF DAMAGE TO WATER SUPPLY),
541 P2d 559-66 (Ariz. 1975). 8p.

Descriptors: *Arizona, *Percolating water, *Water transfer, *Water supply, Beneficial use, Ground water, Subsurface waters, Underground streams, Mining, Imported water, Appropriation, Judicial decisions, Legal aspects, Water table, Water levels, Water importing, Water rights.
Identifiers: *Water mining.

Defendant water suppliers wanted to mine water from beneath their land to transport to outside areas. Plaintiff landowners objected to this water mining, and brought an action to enjoin the suppliers' actions. The plaintiffs contended that the water pumping would lower the water level beneath their land, thus forcing them to dig deeper wells. After the trial court enjoined the defendants from removing percolating ground water in excess of a specified amount, both parties appealed. The defendants contended that the underground waters being mined were not percolating in nature, and thus were subject to appropriation. The plaintiffs, on the other hand, contended that the transportation of any water to outside areas should be enjoined since it adversely affected their rights. The Arizona Supreme Court rejected both contentions, however, holding that underground waters are presumed to be percolating in nature, and that the defendants had introduced no evidence negating that presumption. The Court also found, however, that the beneficial purpose of transporting water to arid lands should be encouraged when at all possible. Thus the defendants would be allowed to pump such amount of water as would do no damage to the plaintiffs' interest. (Hoffman-Florida)
W76-07392

HOLDEN V. LESUEUR COUNTY (REQUIREMENT OF PUBLIC WATER DETERMINATION BY DEPT. OF NAT. RESOURCES FOR ESTABLISHMENT OF DRAIN),
232 NW 2d 806-08 (Minn. 1975). 3 p.

Descriptors: *Drainage, *Marshes, *Minnesota, *Permits, *Ditches, Canals, Channels, Wildlife, Water conveyance, Legal aspects, Judicial decisions, Construction, Marsh management, Regulation, Legislation, Planning, Water permits, Administrative agencies, Control, State governments, Public rights.

Plaintiff landowners brought suit to prevent the establishment of a drainage ditch by defendant county. The proposed ditch was to be 5 miles long and would channelize a natural water course. The drainage would directly affect a 500 acre marshland along the main ditch channel. The plaintiffs contended that a decline in wildlife species in the area would result if the ditch were constructed. The plaintiffs also contended that the defendant had not received a permit from the Department of Natural Resources authorizing the establishment of such a drainage ditch and that the Department had not made a determination of whether public waters would be involved. The Minnesota Supreme Court held that statutory regulation allows construction of such a ditch only after a permit has been received and a determination has been made that no public waters are involved. Since neither requirements had been satisfied the court vacated the lower court's order establishing the ditch. (Welch-Florida)

COMMUNITY RESPONSE TO THE FLOOD DISASTER PROTECTION ACT OF 1973,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Dept. of Rural Sociology.
J. C. Preston, D. E. Moore, and T. Cornick.
Cornell Community and Resource Development Services Bulletin No. 10, Cornell University Water Resources and Marine Sciences Center, Ithaca, N.Y., 20 p, 1 fig, 3 ref. August 1975. OWRT A-058-NY (1) 14-31-0001-5032.

Descriptors: Insurance, *Flood Plain Insurance, Disasters, *Community development, *New York, Cities, Urbanization.
Identifiers: *Susquehanna River Basin(NY), *Flood Disaster Protection Act of 1973.

Community enrollment in the Federal Flood Insurance Program created by Congress in 1968 was on a voluntary basis. In 1973 Congress modified the program placing sanctions on identified municipalities which did not become eligible for the sale of flood insurance within a specified period of time. Despite these modifications, some communities have persisted in ignoring the federal program. The focus of this research was on why some communities have moved to enter the program while others have not. Ten identified flood-prone municipalities, towns, cities and villages, within the New York State portion of the Susquehanna River Basin were selected for the study. The study found that certain pre-existing aspects of local communities are associated with participation in the flood insurance program. The municipalities studied are likely to be in the program if they or their neighbors: had been flooded recently; had access to professional organizations or expertise for dealing with complex planning issues; and had previous experience with federal programs, land-use problems, and zoning.
W76-06810

NATIONAL ATTEMPTS TO REDUCE LOSSES FROM FLOODS BY PLANNING FOR AND CONTROLLING THE USES OF FLOOD-PRONE LANDS.
General Accounting Office, Washington, D.C.
GAO Report to Congress, Report RED-75-327, March 1975, 80 p, 1 tab.

Descriptors: *Administrative agencies, *Flood control, *Flood plain zoning, *Non-structural alternatives, *Federal government, Flood damage, Monitoring, Federal jurisdiction, Water law, Flood protection, Beneficial use, Multi-purpose projects, Administration, Comprehensive planning, Land use, Land classification, Classification.

Despite the adoption of a national flood control policy in 1936, flood losses increased steadily during the next thirty years. In 1966 a presidential task force developed a unified national program whereby federal agencies would provide leadership for state and local governments in developing comprehensive flood control programs. This report, prepared to inform Congress of the effectiveness of the national program, found that little progress had been made in curtailing flood losses. One of the major causes found for this lack of progress was that flood hazard areas were not being properly evaluated by the Federal agencies. As a result, the improper development of flood prone lands continued at an unabated pace. The federal agencies were also found to have been deficient in providing necessary monitoring of federal projects. Consequently, many flood control projects were not carried out under prescribed guidelines and procedures, with resulting disruption of the uniformity essential to the success of the overall national program. These weaknesses in the federal implementation of the program were found to be further aggravated by state and local governments which, for a variety of reasons, failed to seek or failed to enact federal assistance and recommendations. The report concludes with recommendations for solving these problems. (Hoffman-Florida)

SAMPLE FLOOD PLAIN ZONING ORDINANCE FOR LOCAL UNITS OF GOVERNMENT.
Minnesota Dept. of Natural Resources, St. Paul.
(Dec 1970). 62 p, 2 fig.

Descriptors: *Minnesota, *Flood plain zoning, *Land use, *Beneficial use, *Land classification, Permits, Reasonable use, Administration, Floodways, Flood protection, Non-structural alternatives, Flood plains, Flood protection, Penalties(Legal), Legal aspects, Legislation, Construction, Maps, Land management, Zoning, Adoption of practices.
Identifiers: *National Environmental Policy Act, *Flood fringe districts.

In order to promote the efficient management of flood prone lands, Minnesota has promulagated a sample ordinance to help implement the state's Flood Plain Management Act. The major purpose of the ordinance is to regulate land use development in flood plain areas. To accomplish this goal, the ordinance suggests that flood prone lands be zoned as either floodway districts, or flood fringe districts. While floodway districts will usually be limited to land uses with a low flood damage potential, flood fringe districts will generally not be so restricted, and may often contain numerous buildings and other structures. The sample ordinance contains several general provisions, including: establishment of the official zoning map; rules for the interpretation of district boundaries; and a warning and disclaimer of liability. The ordinance also presents a list of permitted and conditional uses suggested for the various districts. To insure compliance, all landowners must apply for a permit before making alterations or additions to their flood prone lands. The procedures to be followed in applying for the permit, and the criteria and procedures to be followed by the zoning agency in considering the permit application, are presented. Finally, the ordinance provides civil and criminal penalties for the violation of any of its provisions. (Hoffman-Florida)

NEBRASKA FLOOD-PLAIN MANAGEMENT PROGRAM--PART I,
Nebraska Natural Resources Commission, Lincoln. Flood Plain Management Section.
A. E. Mathews.
Journal of the Hydraulics Division, Vol. 101, No. HY7, Proceedings paper No. 11437, Proceedings of the American Society of Civil Engineers, p 977-982, July 1975.

Descriptors: *Flood control, *Flood plains, Hydraulics, *Land use, State jurisdiction, Hydrology, Legislation, Regulation, Standards, Control, Governments, *Nebraska.
Identifiers: Water surface profile computation.

Preliminary work resulted in the special recommendation that legislative steps be taken to create a program of flood plain delineation and land use regulation in the State of Nebraska. Legislative Bill 893, the Nebraska Flood Plain Regulation Act enacted in 1967, provided the statutory authority. The Nebraska program utilizes the most recently developed techniques in the field of flood discharges and water surface profile computation. The statute provides for the legal establishment of floodway encroachment lines by order of the Nebraska Natural Resources Commission following a public hearing. It directs initial responsibility for the administration of regulation over the delineated and established floodways to the local governmental entity. Backup authority for regulatory control is vested in the state only on failure of the local government to adopt or enforce the necessary controls within 2 years of establishment. The regulatory program is compatible with both structural and nonstructural flood damages abatement programs. (See also W76-07216) (Bell-Cornell)

NEBRASKA FLOOD-PLAIN MANAGEMENT PROGRAM--PART II,
Nebraska Natural Resources Commission, Lincoln.
J. R. Cook.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. HY7, Proceedings paper No. 11438, p 983-987, July 1975. 3 ref.

Descriptors: *Flood control, *Channels, *Land use, *Nebraska, *Legislation, Hydrology, *Mapping, *Photogrammetry, *Regulation, Constitutional law, Rivers, Streams.
Identifiers: Urban planning, *Waterways(Watercourses), Public relations.

Administrators of Nebraska's Flood Plain Regulation Act have encountered many social, political, and legal problems in implementing floodplain regulation. As regulations become increasingly unpopular with increased implementation, legislative refinements in the act have been difficult to achieve. Appeasing those with serious objections is frequently impossible, even though such objection may be based upon misunderstanding or erroneous information. To be constitutional, floodplain regulations must not be arbitrary or capricious; they must bear a reasonable relationship to the objectives to be accomplished, and they must not result in a taking of property without just compensation. To assure compliance with these standards, property owners similarly situated must be treated alike and the techniques for computing flood discharges and for mapping those discharges must be carefully selected and accurately utilized. NEPA AND THE CZMA: THE ENVIRONMENTAL IMPACT STATEMENT AND SECTION 306 GUIDELINES,
Rhode Island Univ., Kingston.
F. X. Cameron.

William and Mary Law Review, Vol. 16, No. 4, p. 773-92 (1975). 20 p.

Descriptors: *Environmental effects, *Legislation, *Coordination, *Environmental control, Coastal plains, Coasts, Water pollution, Water pollution control, Water policy, Water resources, Federal government, Federal jurisdiction, Political aspects, Administrative agencies, Governmental interrelations, Decision making, Comprehensive planning, Control, Project planning.
Identifiers: *Environmental impact statements, *Coastal Zone Management Act, *National Environmental Policy Act.

Both the National Environmental Policy Act of 1969 (NEPA) and the Coastal Zone Management Act of 1972 (CZMA) represent significant federal legislation in the area of environmental planning and management. NEPA focuses upon the federal agencies by requiring environmental impact statements on their proposed major actions, while CZMA focuses upon the state level, primarily promoting the development of a management process. The National Oceanic and Atmospheric Administration (NOAA) has decided in dealing with the interaction of requirements and procedures of these two Acts to require environmental impact statements when each state submits its coastal zone management plan for federal approval rather than during the development of its general guidelines as directed by NEPA under a strict statutory interpretation. All impact statements still must satisfy NFPA criteria, including identification of the environmental effects of all proposals and alternatives. All coastal zone resources should be considered for any possible environmental impacts of any proposed actions. (Welch-Florida)

SITING OF ENERGY FACILITIES IN THE COASTAL ZONE -- A CRITICAL REGULATORY HIATUS,
Marshall-Wythe School of Law, Williamsburg, Va.
S. C. Whitney.
William and Mary Law Review, Vol. 16, No. 4, p. 805-22 (1975). 18 p.

Descriptors: *Environmental effects, *Sites, *Nuclear energy, *Energy, Coasts, Oil industry, Data collections, Decision making, Administration, Grants, Government finance, Land use, Land management, Land development, Natural resources, Coordination.
Identifiers: *Coastal zone, *coastal Zone Mangement Act.

Because of numerous political and economic factors, it is critical that the United States take steps to provide the energy production necessary for national self-sufficiency. Several of America's most promising prospects, however, such as nuclear development and offshore oil and gas production, will be facing environmental opposition concerning the coastal zone siting of facilities necessary for their development. Because of Congressional inaction, the most effective solution to this siting problem would be in the state programs implemented under the Coastal Zone Management Act. To achieve local acceptance of facility siting, local decisionmakers must make available adequate information so that the public will be aware of all the effects, both good and bad, that will result from a particular facility siting. Once this information is available, forums for public participation are essential so that fears about the loss of local control on land use decisionmaking can be avoided. In addition, a grant program using offshore royalties should be developed to provide funds necessary for correcting or minimizing any adverse environmental effects that might result. Federal cooperation will be needed to assure localities that the federal government will not take dominant control of these programs once local authorization for facility siting has been given. DESIGN APPROVAL AND ENVIRONMENTAL IMPACT.
Federal Highway Administration, Washington, D. C.
39 Fed. Reg. 41804-21 (1975). 18 p.

Descriptors: *Road construction, *Environmental effects, *Water quality, *Water conservation, *Highway effects, Highway beautification, Highways, Roads, Road design, Roadbanks, Civil engineering, Highway relocation, Administrative agencies, Environmental engineering, Coastal plains, Flood plains, Federal government, Wetlands, Transportation, Planning, Research priorities.
Identifiers: *Environmental impact statements, Administrative regulations.

The Federal Highway Administration (FHWA) of the Department of Transportation has set forth regulations and procedures for processing environmental impact and related statements, along with guidelines for public hearings concerning highway location and design, and procedural guidelines for the use of FHWA field officers in preparing action plans giving consideration to the best overall public interest. These regulations apply to all highway construction or reconstruction involving substantial planning and expenditures administered by FHWA. A final environmental impact statement must be prepared for all construction that after a required study is deemed significantly to affect the quality of the human environment. These regulations also enumerate the various internal requirements for environmental impact statements, including that of water quality impact. Possible water quality impacts include erosion and subsequent sedimentation problems, waste water disposal at roadside rest areas, and contamination of surface and ground water supplies by polluted fill material. Within the statement evaluations must also include coastal zone impacts, stream modification impacts, and flood hazards. (Welch-Florida)

A METHODOLOGY FOR IMPACT ASSESSMENT IN THE ESTUARINE/MARINE ENVIRONMENT,
California Univ., Livermore. Lawrence Livermore Lab.
K. F. Haven.
Available from the National Technical Information Service, Springfield, Va., 22161, as UCRL-51949, $4.00 in paper copy, $2.25 in microfiche.Report UCRL-51949, October, 1975. 43 p, 22 fig, 34 ref. W-7405-Eng-48

Descriptors: *Model studies, *Assessments, *Methodology, *Estuarine environment, Energy, *Environmental effects, Input-output analysis, Ecological distribution, Economic impact, Water pollution effects.
Identifiers: Marine environment, *Environmental impact.

The goal was to develop a model for assessing and evaluating the impact of present and future energy-related activities on the marine/estuarine environment. These impacts can be measured in economic terms by tracing the impact flow out of the economic sector through the marine environment and back into the economic sector in terms of changes in availability of natural resources. Two types of models are proposed; an ecological input/output model and a dynamic (difference equation) model. The ability to track lethal and sublethal, direct and indirect and short- and long-term effects of a variety of pollutants related to the production and use of energy resources is included in the acceptability criteria for the models. SURVEY OF CURRENT ENVIRONMENTAL RESEARCH ON SAN FRANCISCO BAY AND DELTA WATERS,
California Univ., Livermore. Lawrence Livermore Lab.
R. L. Ritschard.
Available from the National Technical Information Service, Springfield, Va. 22161 as UCRL-51950 $4.00 in paper copy, $2.25 in microfiche. UCRL 51950 October 175. 34 p, 4 tab, append. W-7405-Eng-48.

Descriptors: *Surveys, *Data collections, Projects, Deltas, Bays, *California, Computer programs, Water pollution control.
Identifiers: *San Francisco Bay and Delta(Calif).

This survey identifies the current research activities on the San Francisco Bay and Delta waters and describes the computer systems available to some of the government agencies and research institutions in the Bay-Delta region. Included in the report are the major federal and State agencies, academic institutons, consulting firms, and interested groups and have ongoing research programs. The survey of each agency or institution includes the specific projects, the goals of each project, the type of data collected, the years of study, and the funding agency. The method of data management and storage is described and information is available. (Chilton-ORNL)

THE ROLE OF TWO MANITOBA TRIBUNALS IN ENVIRONMENTAL DECISION MAKING,
Manitoba Univ., Dept. of Civil Engineering. Winnipeg.
C. Booy.
In: Ask the People, Proceedings of a Multi-Disciplinary Workshop on Public Participation in the Environmental Management Decision Making Process, C.G. Morely, ed. Agassiz Centre for Water Studies. University of British Columbia, Vancouver. p 67-84, 1973.

Descriptors: Administration, *Water rights, *Environmental effects, *Public rights, Competing uses, Water policy, Laws, Legal aspects, *Canada, Social participation.
Identifiers: *Public participation, *Manitoba, Environmental quality.

The Manitoba Clean Environment Commission (MCEC) and the Manitoba Water Commission (MWC) are examined to see how they managed to balance society's need for efficient governmental administration against the right of the public to be heard and to be informed in decisions affecting environmental quality. The MCEC in its first year (1968) issued only 50 of the hundreds of licenses required. Inadequate technical staff and lengthy hearing procedures caused serious delays, which have been partially alleviated by legislative amendments. The MWC was formed in 1967 to examine and make recommendations on the regulation of Lake Winnipeg, particularly in its use for power generation. Public involvement was sought in the formulation of the proposals, in submitting the proposals to the community's value judgements, and in hearing parties with a special interest in the regulation. Ideal conditions for an advisory commission are discussed, including political independece, public operation, and a role limited to supplying provisional advice. The MWC does have a significant role, which includes both informing the public in simple non-technical language of the possible impacts of different proposals, and listening to public opinion through open hearings. (Herr-North Carolina)

REPORT OF WORKING GROUP A: ENVIRONMENTAL DECISIONS ON MAJOR PROJECTS.
In: Ask the People, Proceedings of a Multi-Disciplinary Workshop on Public Participation in the Environmental Management Decision Making Process, C.G. Morely, ed. Agassiz Centre for Water Studies University of British Columbia, Vancouver Appendix A, 1973. 10 p, 2 fig.

Descriptors: *Project planning, *Legal aspects, *Decision making, *Environmental effects, *Evaluation, *Information exchange, Feasibility studies, Project purposes, Project feasibility, Public rights, Political aspects, Social aspects.
Identifiers: *Public participation, Public hearings, Environmental impact analysis.

The use of public input in making environmental decisions on major projects such as dams, highways, and pipelines, is examined in detail. Hearings at two distinct stages in the decision making process are suggested. Initial hearings at the thesis or conception stage would consider draft proposals. Two-way information flow between the public and the decision making agency would allow testing of proposed project guidelines. An independent hearing chairman or board would administer oaths and cross-examine parties, but generally hearings at this stage of the project should be as informal as possible. A second round of hearings should be held to examine specific project proposals after they have been developed. Applications should be tested against previously developed guidelines and criteria. Limited guideline revision should also be possible if deficiencies are obvious. Without applying strict legal rules of evidence, this hearing should be relatively formal, held before an independent tribunal which has the necessary technical expertise. Public assistance should be available to make certain that all interested parties can afford to participate effectively. There should be full disclosure of information to all parties. Final decisions, obviously of a political nature, should be made openly by politicians after ample public hearings and exposure of issues. (Herr-North Carolina)
W76-07029

REPORT OF WORKING GROUP B: PROMULGATION OF ENVIRONMENTAL QUALITY STANDARDS.
In: Ask the People, Proceedings of a Multi-Disciplinary Workshop on Public Participation in the Environmental Management Decision Making Process, C.G. Morely, ed. Agassiz Centre for Water Studies. University of British Columbia, Vancouver. Appendix B, 1973. 10 p, 1 fig.

Descriptors: *Standards, *Regulation, *Decision making, *Environmental effects, *Information exchange, Legal aspects, Design standards, *Water quality standards, Administrative decisions, Political aspects, Legislation, Planning, Adjudication procedure, Public rights.
Identifiers: Public hearings, Environmental quality standards, Public participation, Environmental impacts.

Problems in making environmental quality standards more responsive to the needs and preferences of the public are explored. Current practices which involve government setting standards after consulting with the affected industry are virtually beyond public input. Hearings should be held early in the process before specific value judgements become set in standards to which the decision maker becomes committed. A flow chart outlines the proposed process, including: problem identification with provision for hearings if that project is abandoned so that the public can be told why; strategy definition with public hearings; and promulgation of detailed technical standards, again with public hearings. Detailed information packages should be made available before all hearings to encourage well-informed public participation. Hearings should not be technical or legalistic although some form of 'cross-examination' should be included in the hearings on specific standards so that the public can question the government about the environmental impacts of the alternatives proposed. Notice should be published in the popular press and interested groups should be contacted. Review of the efforts of industry to comply with the standards should be guaranteed by a procedure, as should periodic public review of the standards. (Herr-North Carolina)

Identifiers: *Environmental impact, *Water budget, Conflict, Review process.

Land development projects that are presumed to have regional impact according to the Florida Land and Water Management Act of 1972 are forced to minimize adverse environmental impact through a detailed procedure called Application for Development Approval (ADA). In Southeast Florida, as part of this review process, the water-supply and flooding conflicts must be resolved with the regional water management agency, the Central and South Florida Flood Control District (FCD). This paper discusses the efforts made to resolve these two conflicts for a large proposed residential development in Broward County, Florida. The project, as envisioned by Leadership Housing, Inc., places 25,000 dwelling units on the 3,960-acre site. The project is located in a flood prone area of the Hillsboro Canal Basin and is at the northwest edge of the Biscayne Aquifer. Significant land modification is required to flood-proof the project. The water-supply conflict was resolved only when the FCD was assured that the ultimate water demand for the project was balanced by the natural recharge to the site. Significant water-resources studies were required to produce these conflict resolutions. (Bell-Cornell)

Three general problems associated with the performance of environmental assessments are

identified. The first is the problem of defining the scope of study, including geographic boundaries, level of detail, and use of the assessment. The second category concerns problems involving interdisciplinary team organization and communication. The third problem relates to the selection of the appropriate methodology to use in performing the assessment. An analysis of these problems along with suggested approaches for their solution is presented. There are basically six types of methodologies which can be employed in an assessment effort: (1) descriptive; (2) checklist; (3) association Matrix; (4) network Analysis; (5) index Value; and (6) computer. Assessments should reflect the fact that their value ultimately is manifested by their utility to decision makers, the reviewing agencies, and the general public. (Bell-Cornell)

Identifiers: Congressional hearings, *Coastal zone management, *Territorial seas(Jurisdiction), Environmental Impact Statement, Administrative regulations.

The Committee on Outer Continental Shelf (OCS) held a series of hearings from June to November, 1975. The purpose of these hearings was to consider and report to the full House on legislation establishing a national policy for the management of oil and natural gas in the OCS, as well as to protect the marine and coastal environment, and to amend the Outer Continental Shelf Lands Act. The Committee considered proposed changes in the primary legislation structuring the management of federally owned lands beyond the territorial waters of the States. The mandate of the Committee was directed to House Bill 6218, a 38 page bill which addresses, among other things, the following points: (1) the need for a study to determine whether Federal or private exploration will be utilized to discover the resources of the OCS; (2) new and revised federal leasing procedures which take into consideration the social, economic and environmental impacts of drilling in the OCS; (3) inspection and enforcement of new safety standards for oil and gas operations; and (4) the provision of more participation by the States in OCS development. DATA MANAGEMENT IN COASTAL ZONE PLANNING,
Dames and Moore, Los Angeles, Calif. Planning Systems Group.
W. R. Miller, and S. C. Whitney.
William and Mary Law Review, Vol. 16, No. 4, p. 793-804 (1975). 12 p, 1 fig.

Descriptors: *Coasts, *Data collections, *Data transmission, *Monitoring, Management, Comprehensive planning, Decision making, Mapping, Maps, Topography, Measuring, Statistics, Measurement, Basic data collections, Charts.
Identifiers: *Coastal Zone Management Act.

In order to provide a framework for a successful coastal zone planning program, the Coastal Zone Management Act (CZMA) was enacted in 1972. An essential element to the ultimate success of this Act will be the compilation and availability of scientific and environmental data. Without this data, sound management decisions will be impossible. One of the ways to develop this data is through a data management program concerned with the planning and monitoring of the flow of information through a project. Because of the nature of coastal zone management this information will be of two types, mappable information, and decision information. This mappable information, which includes such aspects as the identification of the coastal zone boundaries, should be charted in detail first, so that a determination of what information is needed and how it will be used can be made before the actual data aquisition. In general, a data management program should involve seven basic tasks: identify issues of concern; identify data requirements; develop base map standards; develop data taxonomy; develop data structure diagrams; stimulate data evaluation procedures; and finalize data management standards. A brief description of the functions and goals of each of these tasks is presented. (Hoffman-Florida)

AVAILABILITY OF GROUND WATER IN THE UPPER CONNECTICUT RIVER BASIN, NORTHERN NEW HAMPSHIRE,
Geological Survey Concord, N. H.
J. E. Cotton.
Water-Resources Investigations 53-75 (open-file report), 1975. 1 sheet, 3 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Available water, *Water quality, *New Hampshire, Hydrologic data, Hydrogeology, Maps.
Identifiers: *Upper Connecticut River basin(NH).

This map provides assessment of the availability of the groundwater in the New Hampshire part of the upper Connecticut River basin. The report is a generalization of several hydrogeologic factors and provides a guideline for groundwater exploration which is useful in water- and land-use planning. The most productive aquifers in the basin are deposits of stratified sand or sand and gravel of Pleistocene age. Large aquifers of this type occur in the Connecticut River valley from North Stratford to West Stewartstown and in the valley of the Upper Ammonoosuc River (a tributary of the Connecticut River). The groundwater is generally of good chemical quality. However, iron and manganese in concentrations greater than the U.S. Public Health Service recommended limits for drinking water are not uncommon. (Woodard-USGS)
W76-07114

WATER RESOURCES OF THE LAKE OF THE WOODS WATERSHED, NORTH-CENTRAL MINNESOTA,
Geological Survey, St. Paul, Minn.
J. O. Helgesen, G. F. Lindholm, and D. W. Ericson.
For sale by U S Geological Survey, Reston, Va., 22092, $1.75 per set. Hydrologic Investigations Atlas HA-544, 1975. 2 sheets, 4 fig, 14 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Minnesota, Hydrologic data, Maps, Hydrographs, Streamflow, Flow rates, Aquifer characteristics, Water analysis, Chemical analysis.
Identifiers: *Lake of the Woods watershed(Minn).

Water resources in Lake of the Woods watershed, Minn., are only slightly developed. Much of the watershed consists of peat-covered wetlands. Essentially all water used is withdrawn from confined glacial drift aquifers characterized by high static head. Drift thickness ranges from zero to more than 200 ft. Underlying the drift is igneous or metamorphic bedrock of low water-yielding capability. Confined drift aquifers, a large surficial sand aquifer, Lake of the Woods, Rainy River, and Rapid River, all provide potential for future water-supply development. Groundwater is primarily of the calcium magnesium bicarbonate type, generally very hard and high in iron and manganese. Groundwater quality is related to position in the regional groundwater flow system. In the recharge area, groundwater is relatively low in dissolved solids and hardness. Downgradient in the flow system, water becomes more mineralized. Base flow to streams is low in winter and during prolonged dry spells. Most streams draining less than 100 sq mi have no flow at times. Stream water is commonly high in color, iron, and manganese. Biochemical quality of Rainy River water is poor to fair. (Woodard-USGS)
W76-07115

FLOODS IN PALATINE QUADRANGLE, ILLINOIS,
Geological Survey, Champaign, Ill.
H. E. Allen, D. W. Ellis, and D. E. Long.
Availability; For sale by USGS, Reston, Va. 22092, price $1.25. Hydrologic Investigations Atlas HA-87, 1964 (Reprinted 1975). 1 sheet, 8 fig, 3 ref.

Descriptors: *Floods, *Flood plains, *Flood frequency, *Flood profiles, *Illinois, Maps, Hydrographs, Streamflow, Hydrologic data.
Identifiers: Palatine quadrangle(Ill).

The approximate areas inundated by floods along streams in the Palatine 7 1/2-minute quadrangle, Illinois, are delineated on the map. Inundated areas are shown along Salt Creek and its unnamed tributaries, Arlington Heights Branch Salt Creek, and East Branch Poplar Creek for the floods of July 1957; along West Branch Salt Creek for the flood of October 1954; and along an unnamed tributary of West Branch Salt Creek for the flood of September 1961. Other figures show frequency of flood stages and flood profiles. (Woodard-USGS)
W76-07116

WATER RESOURCES OF THE CEDAR RIVER WATERSHED, SOUTHEASTERN MINNESOTA,
Geological Survey, St. Paul, Minn.
D. F. Farrell, W. L. Broussard, H. W. Anderson, Jr., and M. F. Hult.
Availability: For sale by USGS, Reston, Va. 22092, price $1.75 per set. Hydrologic Investigations Atlas HA-552, 1975. 3 sheets, 10 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Minnesota, Hydrologic data, Maps, Water yield, Water utilization, Streamflow, Flow rates, Aquifer characteristics, Hydrogeology, Hydrographs, Dissolved solids, Nutrients.
Identifiers: *Cedar River watershed(Minn).

The Cedar River watershed includes 1,204 sq mi of mostly flat or gently undulating plain in parts of Freeborn, Mower, and surrounding counties in Minnesota. The average annual water budget for 30 years shows 30.3 in of precipitation, 5.9 in of surface runoff, and 24.4 in of evapotranspiration. Water use in millions of gallons for 1970 was 6,291 of groundwater and 791 of surface water. Domestic supplies accounted for about one-third and industrial use for about sixty percent of the total use. All 24 municipalities use water from bedrock aquifers, and 19 of those obtain at least part of their supply from the Cedar Valley-Maquoketa-Dubuque-Galena aquifer. The groundwater system is recharged primarily by infiltrating precipitation through glacial deposits. Groundwater movement is indicated by water-table and potentiometric maps and section diagrams. Water from bedrock and glacial aquifers is generally of acceptable quality for domestic use, dissolved solids generally less than 400 mg/l, very hard, and locally high iron and nitrate concentration. The Jordan aquifer locally contains high dissolved solids and sulfate concentration. Runoff is greatest during the spring snowmelt. High runoff may occur locally during summer after rainstorms. Runoff recedes during late summer to its lowest during late winter. (Woodard-USGS)

WATER RESOURCES OF THE RIVER RAISIN BASIN, SOUTHEASTERN MICHIGAN,
Geological Survey, Lansing, Mich.
R. L. Knutilla, and W. B. Allen.
Availability: For sale by USGS, Reston, Va. 22092, price $1.75 per set. Hydrologic Investigations Atlas HA-520, 1975. 27 p, 2 sheets, 11 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Water quality, *Michigan, River basins, Small watersheds, Hydrologic data, Maps, Streamflow, Aquifer characteristics, Physical properties, Topography, Hydrogeology.
Identifiers: *River Raisin basin(Mich).

This hydrologic atlas represents a part of a comprehensive study of the water resources of southeastern Michigan. Its purpose is to provide information on (1) the physical features of the River Raisin and its tributaries, (2) the characteristics of streamflow, (3) the quality of surface and groundwater, and (4) the availability of groundwater. The atlas is one in a series on the several river basins in southeastern Michigan. The River Raisin basin, an area of 1,072 sq mi is characterized by hilly to moderately undulating topography in the western and northwestern parts and by relatively flat terrain in the southeast. Tables summarize some physiographic data for selected subbasins in the River Raisin basin having about 2 or more sq mi of drainage area. Selected subbasins of the major streams include area above mouths of tributaries, and points of interest such as highways, towns, gaging stations, or dams, and below the confluence of the main stream and a tributary so as to include both drainage areas. Similar criteria were used for tributary streams, except where the tributary was too small to merit further dividing. Most subbasins are shown on the basin map. (Woodard-USGS)
W76-07118

GROUND-WATER LEVELS ON BOSTON PENINSULA, MASSACHUSETTS,
Geological Survey, Boston, Mass.
J. E. Cotton, and D. F. Delaney.
Availability: For sale by USGS, Reston, Va. 22092, $2.50 per set. Hydrologic Investigations Atlas HA-513, 1975. 4 sheets, 1 fig, 12 ref.

Descriptors: *Aquifer characteristics, *Groundwater, *Water level fluctuations, *Construction, *Foundations, *Massachusetts, Data collections, Hydrologic data, Maps, Water table, Dewatering, Excavation.
Identifiers: *Boston Peninsula(Mass).

Although groundwater is no longer a significant source of water supply on Boston peninsula, Mass., it continues to be important. In filled land areas the position of the water table is critical for the structural safety of buildings built on wooden pilings driven through fill into underlying deposits. Large-scale urban-renewal projects, with their multistoried buildings and block-sized excavations, require extensive dewatering. Such activity potentially threatens wooden foundation pilings of nearby buildings, because the wood may deteriorate if exposed to air by lowering the water table. This report gives the results of monitoring groundwater levels before, during, and after dewatering associated with the construction of the proposed Inner Belt expressway across the peninsula. In addition, data are provided on fluctuations of groundwater levels in the landfill areas where wooden pilings have been used. The water-table contour maps compare low water of September 1967 and high water of March 1968, respectively, with composite low and high water tables from 1936 to 1940. This report will aid roadway and foundation engineers in scheduling groundwater-recharge programs to protect wooden pilings during future construction projects and in assessing buoyancy factors in the design of substructures. (Woodard-USGS)
W76-07119

WATER RESOURCES DATA FOR CALIFORNIA, 1974: PART 1. SURFACE WATER RECORDS--VOLUME 1.
Geological Survey, Menlo Park, Calif.
Geological Survey Data Report, 1974. 495 p, 4 fig, 1 tab, 3 ref.

Descriptors: *Basic data collections, *Surface waters, *California, *Water yield, *Streamflow, Gaging stations, Flow rates, Lakes, Reservoirs, Reservoir storage, Elevation, Crest-stage gages.

Surface-water records for the 1974 water year for California include data of streamflow or reservoir storage at gaging stations, partial-record stations, and miscellaneous sites. Records for a few pertinent gaging stations in bordering States also are included. The data generally comprise a description of the station and tabulations of basic data. For gaging stations on streams or canals a table showing the daily discharge and monthly and yearly discharge is given. For gaging stations on lakes and reservoirs a monthly summary table of stage and contents or a table showing the daily contents is given. Tables of daily mean gage heights are included for some streamflow stations and for some reservoir stations. Data collected at partial-record stations and miscellaneous sites are given in three tables. The first is a table of discharge measurements at low-flow; the second is a table of annual maximum stage and discharge; and the third is a table of discharge measurements at miscellaneous sites. (Woodard-USGS)
W76-07121

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 5. HUDSON BAY AND UPPER MISSISSIPPI RIVER BASINS--VOLUME 1. HUDSON BAY BASIN.
Geological Survey, Reston, Va.
Available from Supt. of Documents, GPO, Wash., D.C. 20402, price $4.10. Water-Supply Paper 2113, 1976. 425 p, 1 fig.

Descriptors: *Basic data collections, *Surface waters, *Streamflow, *Lakes, *Mississippi River basin, Minnesota, North Dakota, Runoff, Flow rates, Gaging station, Reservoir storage, Water levels, Hydrologic data.
Identifiers: Mean streamflow, Minimum streamflow, Minimum streamflow, *Hudson Bay Basin.

This is one of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during 1966-70 water years; it contains the records for gaging stations and partial-record stations in the Hudson Bay and Upper Mississippi River Basin. This report is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, mean, maximum, and minimum discharges. (Woodard-USGS)

INDEX OF SURFACE WATER STATIONS IN TEXAS, JANUARY 1976.
Geological Survey, Austin, Tex.
Geological Survey Texas District report, 1976. 21 p, 1 plate, 2 tab.

Descriptors: *Indexing, *Data collection, *Sites, *Surface waters, *Texas, Gaging stations, Water measurement, Tides, Water quality, Streamflow, Sediments, Flood data, Reservoirs, Organic compounds, Pesticides.

This index of surface-water data-collection sites in Texas shows the station number and name, type of data collected, and the office principally responsible for the data collection. A permanent numerical designation for gaging stations has been adopted on a nationwide basis; stations are numbered and listed in downstream order. As of October 1, 1975, 476 stream-gaging, 80 reservoir-content, 12 stage, 60 flood-hydrograph partial-record, 12 flood-profile partial-record, 155 low-flow partial-record, 4 crest-stage partial-record, 56 tide-level, 118 daily chemical-quality, 30 continuous-recording water-quality, 109 periodic chemical-quality, 172 periodic organic-quality, 118 pesticides, 5 sediment, 32 periodic sediment, 79 periodic biological, and 68 reservoir-inventory stations were in operation. (Woodard-USGS)
W76-07127

WATER-RESOURCES INVESTIGATIONS IN TEXAS, FISCAL YEAR 1976.
Geological Survey, Austin, Tex.
Geological Survey Texas District Report, January 1976. 29 p, 1 map.

Descriptors: *Water resources, *Projects, *Texas, *Networks, Surface waters, Groundwater, Water quality, Gaging stations, Streamflow, Bibliographies, Publications, Data collections, Hydrologic data, Reviews.

Water-resources investigations by the U.S. Geological Survey in Texas consist of the collection of basic records through the hydrologic-data network, interpretive studies, and research projects. The basic-data records and the results of investigations are published by the Geological Survey or by cooperating agencies. This report describes the water-resources projects and activities of the Geological Survey in Texas for the 1976 fiscal year (July 1, 1975 to September 30, 1976). (Woodard-USGS)
W76-07128

WATER-LEVEL RECORDS FOR THE SAN LUIS VALLEY OF COLORADO, 1972-76,
Geological Survey, Denver, Colo.
R. E. Fidler, and R. D. Penley.
Open-file report, February 1976. 2 fig, 1 tab.

Descriptors: *Groundwater resources, *Water levels, *Basic data collections, *Water wells, *Colorado, Well data, Aquifers, Water level fluctuations, Measurement, Planning, Irrigation.
Identifiers: *San Luis Valley(Colo).

Water-level measurements were made in more than 140 wells in the San Luis Valley of Colorado during January 1976. Changes in water levels from January 1975 to January 1976 ranged from a rise of 13.2 feet (4.0 metres) to a decline of 8.4 feet (2.6 metres) in Costilla County. Measurements for the four preceding winters are also included to serve as references illustrating declining or rising water levels. These data can be used by well owners for planning their irrigation schedules for the next irrigation season and can be used by water managers for developing plans to manage the groundwater resources. (Woodard-USGS)
W76-07129

REVISED ESTIMATES OF MEAN-ANNUAL RUNOFF AND SUMMARY OF PRECIPITATION AND DISCHARGE DATA FOR POST HEADQUARTERS AREA, WHITE SANDS MISSILE RANGE, NEW MEXICO,
Geological Survey, Albuquerque, N. Mex.
A. G. Scott.
Open-file report 76-86, February 1976. 30 p, 5 fig, 4 tab, 10 ref.

Descriptors: *Average runoff, *Forecasting, *Rainfall-runoff relationships, *Military reservations, *New Mexico, Data collections, Hydrologic data, Climatic data, Deserts, Stream gages, Rain gages, Hydrographs.

Identifiers: *White Sands Missile Range(N Mex).

Presented are revised estimates of runoff based on all available pertinent data and all precipitation and runoff data collected by the U.S. Geological Survey at White Sands Missile Range, N. Mex. Estimates are made of long-term mean-annual runoff from the east slopes of the Organ Mountains at seven sites where the stream channels cross the north-south access road in the Post Headquarters area. The data may be used to determine whether runoff that now passes through the area and onto the barren desert could be used to augment the water supply of the Post area. (Woodard-USGS)

LITTLE GOOSE DAM, SNAKE RIVER, WASHINGTON, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Div. North Pacific, Bonneville, Oreg. Div. Hydraulic Lab.
R. L. Johnson, and L. Z. Perkins.
Available from the National Technical Information Service, Springfield, Va., 22161 as AD/A-010 346 $7.50 in paper copy, $2.25 in microfiche copy. Technical Report No. 110-1, April 1975. 179 p, 90 fig, 10 tab.

Descriptors: *Model studies, *Hydraulic models, *Dams, *Spillways, *Washington, Fish ladders, Cofferdams, Energy dissipation, Locks, Structures, Dam design, Hydraulics.
Identifiers: *Little Goose Dam(Wash), *Snake River(Wash).

A 1:100-scale hydraulic model was used to study the alignment of structures, excavation requirements, and flow conditions at Little Goose Dam. Tests of first-step construction led to relocation of the temporary fishway, use of rockfill groins along the north shore, selection of limits for disposal fills, and reductions of excavation, number of cofferdam cells, and height of embankments. The tests indicated that flow conditions during the first phase of second-step construction would be acceptable and that excavation planned for the second phase could be reduced. Approach flow into the completed spillway and powerhouse was satisfactory. The excavated tailrace could be raised 20 ft without decreasing head on the powerhouse. Poor entrance conditions into the lower lock approach were eliminated by shortening and reshaping a protective fill along the river side of the approach. Performance of the fish collection system improved when the north fishway entrance was moved upstream and a 90-ft-long rock dike was placed adjacent to the right wall of the spillway roller bucket. Differences between final design (model) and contract (prototype) structures and excavation plans had no significant effect on flow conditions in the tailrace. Should the dentates in the spillway bucket erode, the hydraulic jump will move downstream, desired head between the fishway entrances will be eliminated, and erosion of the riverbed will be increased. (Sims - ISWS)
W76-07095

EARTHQUAKE: CORRELATION BETWEEN PIPELINE DAMAGE AND GEOLOGIC ENVIRONMENT,
Geological Survey, Menlo Park, Calif.
R. Kachadoorian.
American Water Works Association Journal, Vol 68, No 3, p 165-167, March 1976. 2 tab.

Descriptors: *Design criteria, *Pipelines, *Earthquakes, *Engineering geology, *Earthquake engineering, Seismic design, Geologic formations, Bedrock, Reviews, Evaluation.

Engineers working in the earthquake-prone circum-Pacific belt must consider seismic effects as well as normal problems in the design, construction, and maintenance of pipelines. As cities grow, the engineer is called upon to design increasingly more complex pipeline systems to provide the user with the necessary water, gas, oil, and other products. As the pipeline systems become more complex and widespread, they become more susceptible to damage by an earthquake. Damage to pipelines from both the direct and indirect effects of earthquakes are shown to be least in bedrock, intermediate in coarse-grained sediments, and maximum in fine-grained sediments. If maintenance and repair costs after an earthquake are considered in a route selection for a pipeline, a more expensive route may be more desirable from the long-term standpoint. (Woodard-USGS)

DYNAMIC BEHAVIOR OF BOX-GIRDER JETTIES,
Queen Mary Coll., London (England). Dept. of Civil Engineering.
T. J. Poskitt.
Journal of the Waterways, Harbors, and Coastal Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. WW2, Proceedings paper No. 11310, p 181-22, May 1975. 7 fig, 1 tab, 13 ref.

Descriptors: *Jetties, *Coastal engineering, Design, Dynamic, Testing, Mathematical models, Systems analysis, Steel.
Identifiers: *Box girders, *Force, *Steel beams.

Economy in the design of maritime jetties has led to the investigation of structural form using frames of steel box girders. However, due to their greater flexibility, lower structural damping capacity, they are prone to vibration hazards. A general analytical procedure for studying this phenomenon is given and has been checked by a series of experiments on a model. The sources of disturbance that a jetty will be subjected to are either transient or steady. The first covers cases of impact due to cargo handling or suddenly applied bollard forces, while the second category is concerned with periodic forces, e.g., rotating machinery, vortex shedding, or wave forces. For the first category, methods of determining peak stresses and displacements are given while for the second category it is shown that under certain conditions resonant states can occur that could render the jetty unserviceable. A HISTORY OF BUREAU OF RECLAMATION CONSTRUCTION- PART I,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
H. G. Arthur.
Journal of the Construction Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. CO1, Proceedings paper No. 11189, p 51-68, March 1975. 4 fig, 6 tab.

Descriptors: *Canals, *Construction, *Dams, *History, *Penstocks, *Spillways, Outlet works, Control structures.
Identifiers: *Bureau of Reclamation.

The Bureau of Reclamation and the construction industry have worked in partnership to develop water resources in the 17 western states before and during the years 1925 to 1975, which mark the first half century of the Journal of the Construction Division of ASCE. The construction accomplishments on Reclamation projects built prior to 1925 are summarized. Selected dams, spillways, outlet works, penstocks, canal and canal structures built on Reclamation projects are described in this part as are the methods of constructing them. The designs of the structures and the methods and equipment used to build them have changed gradually. However, landmark structures and construction methods can be cited and are described. LOS ANGELES DAM AND RESERVOIR PROJECT SAN FERNANDO VALLEY, LOS ANGELES COUNTY, CALIFORNIA, VOLS. I AND II.
Federal Disaster Assistance Administration.
December, 1975. 848 p, 14 fig, 35 tab, 1 ref, 8 append. Final HUD-R09-EIS-75-2F.

Descriptors: *Dam construction, *Reservoir construction, *Project planning, *Environmental effects, Water resources development, Design criteria, Water policy, Topography, Flood control, Soil erosion, Recreation, Project feasibility, Federal project policy, Economics, Project benefits, Area redevelopment, Energy conversion, Water quality, Erosion control, Reservoir design, Reservoir sites, Water supply development, Water storage, Damsites, Dam design.
Identifiers: Groundwater systems, Biological effects, Federal Disaster Relief Act, Sub-surface reservoirs, Archeological sites, Environmental benefits, *Environmental impact statement.

The Los Angeles Department of Water and Power proposes to construct a dam and reservoir, along with appurtenant works, to restore the predisaster design capacity, including flood protection, of the Van Norman dams and reservoirs destroyed or damaged during the 1971 San Fernando Earthquake. The principal component of the proposed project will be a dam and reservoir having a total capacity of approximately 10,000 acre feet. The proposed structure will be located on the Van Norman complex in Northern San Fernando Valley in Los Angeles County, California. Approximately 50 percent of the construction work of the major component of the project has been completed to date. Long-term adverse impacts will result in the areas of topography, biological features, community concerns, and potential archeological sites. Long term benefits will occur in the areas of daily and emergency water supply systems, biological setting, flood control and protection, water quality, soils and erosion, and recreational facilities. The impacts and benefits are addressed in detail in this Environmental Impact Statement (EIS). Six alternatives to the project were considered and are also treated in detail in the EIS. MEANS FOR SHOWING AND/OR DETOURING WATER CURRENTS AND THE PREPARATION THEREOF,
Rhone-Poulenc S.A., Paris (France). (Assignee).
Y. Gaudard.
U.S. Patent No. 3,938,339, 3 p, 2 fig, 10 ref; Official Gazette of the United States Patent Office, Vol. 943, No 3, p 1106, February 17, 1976.

Descriptors: *Patents, *Coastal structures, *Jetties, *Coastal engineering, *Shore protection, Currents(Water), Waves(Water), Bodies of water, Fabric.
Identifiers: Unwoven fabric.

A stable jetty is arranged angularly in relation to the edge of a body of water so as to slow down and/or detour the currents. It is composed of a pile of fill whose base rests in an excavation surrounded by an unwoven fabric. The unwoven fabric is laid in the excavation and allowed to hang over the edge. The fill is placed in and above the excavation and the fabric is laid over the fill. A spunbonded type unwoven fabric is made up of continuous filaments which are arranged at random throughout the layer. The filaments are of synthetic materials such as polyesters, particularly ethylene polyterephthalate, or polyamides such as polyhexamethylene adipamide, polycaproamide and the like. The fill making up the body of the jetty is generally a material found on site such as sand, gravel or the like. Cohesion of this material can advantageously be assured by a chemical binder which can be, cement, bitumen, lime or polymerizable resins. The chemical binder is introduced into the fill so as to form a regular, reinforced layer, surrounding the body of the jetty above the excavation. The wave breaking elements at the top of the jetty are made up of traditional materials such as stone or shaped objects of cement or concrete. When shaped objects are used, they are in the form of paving stones that are regularly aligned and cemented together on a grill of plastic or on a synthetic fabric. The role of these objects is to simultaneously protect the jetty and to absorb the shocks created by the waves. (Sinha-OEIS)

GUIDELINES FOR MONITORING SHORE PROTECTION STRUCTURES IN THE GREAT LAKES.
Coastal Engineering Research Center, Fort Belvoir, Va.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-009 500, $4.00 in paper copy, $2.25 in microfiche. Miscellaneous Paper 2-75, February 1975. 38 p, 11 fig, 3 tab, 10 ref, 2 append.

Descriptors: *Shore protection, *Great Lakes, *Beach erosion, Structures, Coastal structures, Groins(Structures), Retaining walls, Breakwaters, Sea walls, Engineering structures, Surveys, Monitoring, Erosion, Erosion control, Lakes.

The extent of wave damage to shores is difficult to predict; it is advisable to observe the behavior of the shore to determine if some protective action is required. After installation of a shore protection structure it is important to continue monitoring shore behavior; and also to inspect for structural changes to determine if the structure is functioning as designed. Optimum and minimum plans for recording shoreline changes and monitoring groins, seawalls, revetments, and offshore breakwaters were given. Simple shore erosion computations and a data analysis program were presented. (Sims - ISWS)

AUTOMATED WET SAND FEEDER FOR OPEN-CIRCUIT FLUMES,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Hydraulics and Water Resources.
M. G. Foley, and E. F. Dalv.
Journal of the Hydraulics Divisien, Proceedings of American Society of Civil Engineers, Vol. 102, No. HY1, p 136-138, January 1976. NSF GK31802, Army DAHC04-74-G-0189.

Descriptors: *Flumes, *Sands, Laboratory equipment, Sediment transport, Sedimentation rates, Sediments, Sediment load, Hydraulic models, Hydraulics.
Identifiers: *Open-circuit flume, Sand feeders, Simulated-flood experiments, Wet sand feeder.

Movable-bed sediment transport experiments in open-circuit flumes require that sand be fed into the flume inlet. Previous sand feeders have required the use of dry sand for accurate input rates. Sand recovery and reuse is necessary in open-circuit simulated-flood experiments now in progress in the W.M. Keck Hydraulics Laboratory, Pasadena, California, because of the high transport rates used. The large amount of sand recycled makes drying between experiments impractical, requiring that the recovered sand be fed wet. The programmable wet sand feeder developed for these experiments was described. Accurate feeding of damp or wet sand requires a straight-walled storage hopper with sand removed from the entire bottom surface of the sand mass. The feeder described uses a set of scrapers attached to sprocket-driven roller chains to remove sand from the bottom of the hopper. When used with an accurately controlled variable-speed drive moter this feeder has a feed rate reproducibility of + or -0.5%. (Lee - ISWS)

SPILLWAY FOR LITTLE GOOSE DAM, SNAKE RIVER, WASHINGTON, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Div. North Pacific, Bonneville Oreg. Div. Hydraulic Lab.
R. L. Johnson, and L. Z. Perkins.
Available from the National Technical Information Service, Springfield, Va., 22161 as AD/A-01 347 $6.00 in paper copy, $2.25 in microfiche. Technical Report No. 114-1, April 1975. 126 p, 7 fig, 18 tab.

Descriptors: *Model studies, *Hydraulic models, *Spillways, *Washington, Spillway crests, Energy dissipation, Settling basins, Dams, Structures, Riprap, Open channel flow, Hydraulics.

Identifiers: *Little Goose Dam(Wash), *Snake River(Wash), Roller buckets.

The spillway for Little Goose Dam, designed to pass discharges up to 850,000 cfs (2125 cfs per ft of crest), was studied in a 1:42.47-scale, 3-bay, sectional model and a 1:100-scale general model to investigate the performance of various elements of the structure and to determine flow conditions in the tailrace. Maximum velocities that fluctuated between 5 and 12 fps along the north embankment upstream from the spillway were indicated by the spillway model. The contraction coefficient for the north abutment was found to be 0.0465 at the project design discharge of 850,000 cfs and head of 65.5 ft. The capacity of the spillway was in close agreement with the computed value. Pressures on the spillway surface were positive for flows lower than 600,000 cfs and were above -15 ft of water during a discharge of 850,000 cfs. Some pressures along the piers 1 ft above the ogee were negative for discharges higher than 450,000 cfs; the minimum pressure at 850,000 cfs was -26 ft. Modifications to increase pressures on the crest and piers were not undertaken because of the remote possibility of flows higher than 400,000 cfs. Tests indicated that the stilling basin of original design was not satisfactory. An acceptable stilling basin was developed in the model, but unusual artesian flow at the site would have required a costly drainage system to protect the basin slab against uplift. Sixteen roller bucket plans were investigated in efforts to eliminate the basin slab and drainage system. A modified Angostura-type bucket, with simpler teeth and shorter apron, was adopted. THE SLIDES IN THE SAN FERNANDO DAMS DURING THE EARTHQUAKE OF FEBRUARY 9, 1971,
California Univ., Berkeley.
H. B. Seed, K. L. Lee, I. M. Idriss, and F. I. Makdisi.
Journal of the Geotechnical Engineering Division, Vol. 101, No. GT7, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 11449, p 651-688, July 1975. 23 fig, 2 tab, 15 ref.

Descriptors: *Dams, *Earthquakes, *Landslides, Finite element analysis, Sand boils, Analytical techniques, Hydraulics, Reservoirs, Downstream, Upstream, History, Effects, Embankments, *California.
Identifiers: *Geotechnical engineering, Field investigations, Scarps, San Fernando Valley(Cal), Dynamic response analyses, Pseudostatic analyses.

The February 9, 1971 earthquake in San Fernando Valley, California, caused slides in the embankments of two old adjacent hydraulic fill dams. At the 140-foot high Lower dam, the entire upstream face slid into the reservoir leaving only 5 feet of freeboard. At the 65-foot high Upper dam, the entire embankment from the waterline to the downstream toe moved downstream 6 feet, leaving a scarp just below the reservoir level on the upstream face. It is concluded that the slide in the lower dam resulted from the development of an extensive zone of liquefaction near the base of the embankment. Some liquefaction is also believed to have occurred in the Upper dam; however, since a significant body of the sand in the upstream and downstream shells of this dam retained considerable strength, complete failure could not occur and the movements were limited in extent. Conclusions are presented concerning the applicability of analytical procedures for predicting the failure and movements that occurred. (Bell-Cornell)

PREDICTION OF WIND WAVE HEIGHTS,
Ecole Polytechnique Federale de Lausanne (Switzerland). Laboratoire d'hydraulique.
H. T. Falvey.
Journal of the Waterways, Harbors, and Coastal Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 100, No. WW1, p 1-12, February 1974. 4 fig, 20 ref.

Descriptors: *Coastal engineering, *Hydrodynamics, *Waves(Water), *Winds, Meteorology, Energy, Lakes, Ocean, Engineering, Oceanography, Probability, Statistical methods, Equations, Evaluation.
Identifiers: Aerodynamics, *Boundary shear, *Wave height, *Spectrum analysis, Transfer concepts, Momentum balance, Wind profiles, Differential equations, Water roughness.

Descriptions of the process by which energy from wind blowing over water is transferred into the water to create waves have been gradually becoming very complicated. A method of predicting wave heights as a function of wind velocity and fetch is developed which avoids the necessity for describing the complex transfer mechanism in detail. The method is based on simplified macroscopic momentum balance equations written for the air boundary layer. The loss of momentum in the air is assumed to be completely converted into the creation of waves. The resulting equations agree well with standard forecasting curves. (Bell-Cornell)

Descriptors: *Estuaries, *Harbors, *Hydraulic models, *Hydrodynamics, *Jetties, Drag, Equations, Structures, Simulation analysis.
Identifiers: *Piezoelectric crystals, *Similitude, River Mersey(England).

Two new methods are proposed for the simulation of piers and similar complex structures in hydraulic models. The methods are based on similarity of parameters formed by modification of the hydrodynamic drag equation and are intended for use when scale models do not provide the required resistance to flow due to lack of similarity of Reynolds numbers. A description is given of the application of these methods to the simulation of oil terminal structures in a hydrodynamic model of the River Mersey estuary. The difficulties of estimating drag forces on complex structures are examined and attention is drawn, in particular, to interference effects on drag forces on elements of complex structures and to blockage effects in laboratory testing of model structures. Identifiers: *Shortages, Filter materials, Revetments.

Plastic cloth filters have been used in relatively small seawalls and revetments, and in conjunction with various types of retaining structures, to prevent leaks through joints, weepholes, etc., with excellent results over the past 15 years. Their use in conjunction with large stone seawalls now gives promise of retaining the material behind them more positively than has been possible with rock-product filters alone. Guidelines for the proper placement of the filter cloth and stone in such structures are presented. (Bell-Cornell)

CONSTRUCTION AND PERFORMANCE OF THE HESS CREEK EARTH FILL DAM, LIVENGOOD, ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N. H.
O. W. Simoni.
The Northern Engineer, Vol. 7, No. 3, p 23-34, Fall 1975. 28 fig, 9 ref.

Descriptors: *Dams, *Earth dams, *Hydraulic-fill dams, *Alaska, Permafrost, Cold regions, Dam design, Dam construction, Dam foundations, Refrigeration, Structures, Hydraulic structures, Soil mechanics, Spillways, Outlet works, Tunnels, Diversion tunnels, Hydraulics.
Identifiers: *Hess Creek earth fill dam(Alas), *Livengood(Alas).

The construction of dams in arctic and subarctic regions of the Northern Hemisphere has been rare. The Hess Creek Dam, located about 8 mi northeast of Livengood, Alaska, is one of the few known large earth-fill dams that has been constructed in the permafrost regions of North America. The effect of dams on the underlying permafrost and their settlement and stability characteristics in permafrost are generally unknown. The Hess Creek Dam is a combination hydraulic fill and rolled-earth fill structure containing about 479,000 cu yd of earth fill. A steel sheet pile cut-off wall runs along the base centerline. A 48-in diameter metal pipe outlet with a control gate was installed through the embankment at one end and a spillway, 1300 ft long and 100 ft wide, was built to accommodate flood flow. A refrigeration system was installed at the base to insure the refreezing of the thawed soil. The upstream face was protected with riprap stone. Available evidence, twenty years after completion, indicates that the earth fill embankment had little or no detrimental effect on the permafrost underlying the center-line of the dam. The spillway required a protective surface against scouring. The past performance and present condition of the Hess Creek Dam suggest that construction of earth fill embankments on permafrost is feasible and practical. (Sims - ISWS)

PROPERTIES OF SOIL IN THE SAN FERNANDO HYDRAULIC FILL DAMS,
California Univ., Berkeley.
K. L. Lee, H. B. Seed, I. M. Idriss, and F. I. Makdisi.
Journal of the Geotechnical Engineering Division, Vol. 101, No. GT8, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 11527, p 801-821, August 1975. 14 fig, 3 tab, 26 ref.

Descriptors: *Dams, *Embankments, *Hydraulics, *Soil properties, *California, Alluvium, Compaction, Density, Sands.
Identifiers: *Geotechnical engineering, Cyclic loads, *Hydraulic fill dams, Penetration, Relative density.

Results are presented of extensive field and laboratory tests on soils from two old hydraulic fill dams that were damaged during the February 9, 1971 San Fernando earthquake. The data include standard penetration, absolute and relative compaction, relative density, static strength, and cyclic triaxial test results for both the hydraulic fill silty sand and the natural silty and gravelly sand alluvium. The relative densities of the hydraulics fills ranged from about 51%-58% and the relative compaction ranged from about 85%-92% of Modified AASHO maximum density. The relative density of the alluvium was about 65%-70%. Other properties were consistent with previously published data from other similar soils at similar densities. (Bell-Cornell)

MARINE SOIL MECHANICS,
Norwegian Geotechnical Inst., Oslo.
O. Eide.
Publication No. 103, 1974. 20 p, 40 ref.

Descriptors: Offshore platforms, *Soil mechanics, Soil surveys, Coastal structures, Bottom sampling, Storage tanks.
Identifiers: *Marine soil mechanics, Offshore structures, Marine deposits, Ocean bottom samplers, Underwater surveys.

This report is a review of some of the more important areas of offshore foundation engineering based on current experience at the Norwegian Geotechnical Institute. It discusses the various methods of investigation, equipment, and boring and sampling techniques used in marine soil surveys. Geology of the North Sea and soil conditions of the sea floor are described. The main problems to be studied in designing foundations for gravity platforms are examined in the following areas: Contact between structure and sea floor, stability against sliding and overturning for static load, installation of platform, settlement, displacement due to static load from a 100-year wave, effect of cyclic loading, dynamic analysis and vibration, scour, and instrumentation of gravity platforms. Special attention is paid to the required safety factors. A discussion of calculated and measured settlement of an oil storage tank is presented. (WES)

STABILITY OF ROCK SLOPES IN MINING AND CIVIL ENGINEERING SITUATIONS,
National Mechanical Engineering Research Inst., Pretoria (South Africa).
T. R. Stacey.
CSIR Report ME 1202, May 1973. 217 p.

Descriptors: *Slope stability, Slopes, *Rockslides, Photoelasticity, *Stress analysis, *Finite element analysis.
Identifiers: Excavated slopes.

Results are presented of various investigations concerning the behavior of rock slopes, with the emphasis being placed on the distributions of stresses in the slopes. The investigations have been conducted by using the finite element method of stress analysis. A version of this method was developed for two-dimensional stress analysis of discontinuous rock slopes. To provide suitable problems for analysis by this method, and, as a secondary object, to study the failure behavior of rock slopes in a typical sedimentary rock mass structure, two- and three-dimensional models were tested in a centrifuge. Applications of stability analyses in practical slope stability investigations are described involving a road cut and three open cast mine configurations. It is concluded that the three-dimensional nature of rock slopes is extremely important and cannot be neglected when considering the stability of slopes. (WES)

8F. Concrete

COATING IMMERSED CONCRETE FOR SWIMMING POOLS AND SEWAGE INSTALLATIONS,
P. J. Gay.
Journal of the Oil and Colour Chemists' Association, Vol. 58, No. 7, p 252-257, 1975. 1 fig, 10 ref.

Descriptors: *Sewage treatment, *Concrete, *Construction materials, *Pipes, *Coatings, Tanks, Paints, Waste water treatment.

Requirements for the protection of concrete sewer pipes and sewage treatment tanks are reported. Some of the chemical changes occurring during the curing of concrete are outlined and the mechanism of the corrosive effect of several types of waters on concrete structures is discussed. Structures in sulfate-bearing wet soil should be isolated from the water by a water-proofed and vapor-proofed membrane and the concrete should be a dense mix of low porosity. Surfaces should be painted by a dry mix using a siliceous aggregate and should be free from laitence and scum before painting. If greases or fats will be present as contaminants, chemically cured coatings, such as epoxies, should be applied. (Kramer-FIRL)

DURABILITY OF CONCRETE IN SEAWATER,
California Univ., Berkeley. Dept. of Civil Engineering.
P. K. Mehta, and H. H. Haynes.
Journal of the Structural Division, Vol. 101, No. ST8, Proceedings of the American Society of Civil Engineers, Proceedings paper No. 11516, p 1679-1686, August 1975. 4 fig, 1 tab, 15 ref.

Descriptors: *Structural engineering, *Sea water, *Concrete, *Deterioration, *Durability, Oceans, Breakwaters, Permeability, Cements, Marine biology, Chemistry.
Identifiers: *Los Angeles Harbor(Cal), *Sulfate attack.

Concrete submerged for 67 years in seawater has shown that low permeability concrete is highly durable to sulfate attack; however, more permeable concrete is susceptible to sulfate attack. Large concrete blocks were retrieved off the Los Angeles Harbor breakwater. Concrete blocks of size 69 in. x 69 in. x 42 in. which were retrieved were part of a test program initiated by the Corps of Engineers in 1905. Cores were tested for compressive strength and material deterioration to determine if the concrete was attached by seawater. Results from other reports of sulfate attack on concrete are summarized. It is concluded that for long-time durability of concrete exposed to seawater, a reduced permeability and reduced alkalinity of concrete appear to be as important as low 3 Ca.Al O content of cement. EVALUATION OF EMPIRICAL AND ANALYTICAL PROCEDURES USED FOR PREDICTING THE RIGID BODY MOTION OF AN EARTH PENETRATOR,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
P. F. Hadala.
Miscellaneous Paper No. S-75-15, June 1975. 78 p, 28 ref.

Descriptors: Evaluation, Soils, Penetration, *Testing procedures, Measurement.
Identifiers: *Soil penetration, Projectile penetration.

Presents a comparison of five pretest predictions with the measured rigid body motion of a large penetrator normally impacting the Watching Hill Blast Range at the Defense Research Establishment, Suffield, Ralston, Alberta, Canada, at an impact velocity of about 500 ft/sec. Prediction methods used were evaluated in detail. They included the Sandia empirical penetration formulas, the spherical and cylindrical cavity expansion theories, a viscoplastic force law, and the AVCO differential area force law. The capability of predicting peak rigid body deceleration and maximum penetration within a factor of two of measured test data was demonstrated by several of the methods. However, none of the five proved to be completely satisfactory or to be so superior to the others that it could be recommended for exclusive use in predicting earth penetrating weapon response. (WES)

EFFECTS OF ANISOTROPIC VERSUS ISOTROPIC CONSOLIDATION IN CONSOLIDATED-UNDRAINED TRIAXIAL COMPRESSION TESTS OF COHESIVE SOILS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. T. Donaghe, and F. C. Townsend.
Technical Report No. S-75-13, October 1975. 111 p, 24 ref.

Descriptors: *Cohesive soils, Consolidation, Shear, Soil tests, Soil analysis.
Identifiers: R tests(Soils), Triaxial shear tests.

Results of a series of consolidated-undrained triaxial compression tests performed on normally consolidated and overconsolidated specimens of two clays consolidated both isotropically and anisotropically are presented and analyzed. The specimens were trimmed from samples of Vicksburg Buckshot clay and a clay from the East Atchafalaya Basin Protection Levee project area. Data presented include stress-strain curves, pore pressure observations, final water content distributions within the specimens, and shear strength envelopes based on total and effective stresses. Conclusions and recommendations are given. (WES)

CAUSES OF SLAKING IN ARGILLACEOUS MATERIALS,
California Univ., Berkeley.
Y. Moriwaki.
PhD Dissertation, 1975. 291 p, 139 ref.

Descriptors: *Slaking, Wetting, Soils, Clays, Materials testing, Drying, *Clay minerals, Testing procedures, Testing.
Identifiers: Clayey soils, *Argillaceous materials.

Results of slaking tests performed under various conditions and on various argillaceous materials are presented for the purpose of clarifying the mechanisms involved in the slaking of natural clayey materials. Tests to examine the effect of various parameters were conducted on artificially prepared, relatively pure clay samples, containing the three main types of clay mineral (kaolinite, illite and monmorillonite) as well as on samples composed of non-clay minerals (quartz and pyrophyllite). The effect of the following parameters were analyzed: mineralogy, adsorbed cations, electrolyte concentrations of slaking fluid, electrolyte concentrations of pore fluid, pH of the slaking fluid, air evacuation, equilibrium relative humidity, consolidation pressure, and grain size. A description of the various testing apparatus and procedures is included. The state of knowledge concerning the slaking behavior of argillaceous material has been reviewed. Different slaking modes encountered during the tests are summarized and a list of principal conclusions given. (WES)

FISH IMPINGEMENT AT MONTICELLO NUCLEAR PLANT,
Northern States Power Co., Minneapolis, Minn.
L. M. Grotbeck, and J. L. Bechthold.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. PO1, Proceedings paper No. 11409, p 69-83, July 1975. 5 fig, 6 tab, 16 ref.

Descriptors: Fish, *Fishkill, *Hydroelectric power, *Powerplant, *Nuclear powerplants, Fish conservation, Fish migration, Fish passages, Evaluation, River flow, Temperature, Measurement, Pumping, *Minnesota.
Identifiers: Impingement, Power.

To properly evaluate total impact of power generation facilities on aquatic systems, it is necessary to perform site specific fish impingement studies. Intake and screen approach velocities should not be averaged when considering potential screen impingement problems because of wide vertical and horizontal variation in velocity which tend to trap fish. It was estimated that 2,952 fish were impinged during 4 months of sampling with 90.9% of these comprised of black bullheads (Ictalurus melas) and black crappies (Pomoxis nigromaculatus). Distinct relationships can be found between number of impinging fish and river flow, percentage river diverted through the plant, water temperature, and the time of year. For the months of June, July, August, and September, approximately 55% of all impingement occurs in June. (Bell-Cornell)
W76-07211

SIMPLE FLUME FOR GUIDANCE AND IMPINGEMENT STUDIES,
Kramer, Chin and Mayo, Inc., Seattle, Wash.
J. L. Congleton, and R. D. Mayo.
Journal of the Power Division, Proceedings of the American Society of Civil Engineers, Vol. 101, No. PO1, Proceedings paper No. 11416, p 35-42, July 1975. 8 fig.

Descriptors: *Fishkill, *Power, *Powerplants, *Testing, *Flumes, Cooling water fish guiding, Design, Operations.
Identifiers: *Fish screens, *Fishways, Impact, Impingement.

The design and operation of a simple recirculating test flume is described. This inexpensive flume has proven useful in developing design criteria for power plant intake screens. Two series of tests are described to demonstrate use of the flume. One series of tests dealt with a fish guidance device, while a second series produced data relating impingement mortality to approach velocity and impingement time. The application of impingement mortality data to the design of power plant intake screens is analyzed, with several examples included. (Bell-Cornell)
W76-07213

CONTROL OF THE SEA LAMPREY (PETROMYZON MARINUS) IN LAKE SUPERIOR, 1953-70,
Fish and Wildlife Service, Marquette, Mich.
B. R. Smith, J. J. Tibbles, and B. G. H. Johnson.
Great Lakes Fish Comm Tech Rep. 26, p 1-60, 1974.

Descriptors: *Lampreys, Predation, Trout, Fish parasites, *Lake Superior, Lakes, Great Lakes, *Fish control agents, Fish barriers.
Identifiers: Trifluoromethyl-4-Nitrophenol, *Lampricide, Petromyzon-Marinus, Salvelinus-Namaycush, TFM, Electrical barriers.

The sea lamprey (P. marinus) gained entrance into Lake Superior in the early 1940's, and began making drastic inroads on the fish stocks by the early 1950's. Serious efforts to control the parasite began in 1953 with the installation of electrical barriers in streams to block spawning runs. Control measures became much more effective after 1958, when a selective toxicant, the lampricide 3-trifluoromethyl-4-nitrophenol (TFM), was used to destroy larval lampreys in streams. A unique methodology was developed for stream treatments which included surveys to find sea lamprey larvae, bioassays to determine effective lampricide concentrations, analytical techniques to monitor concentrations of lampricide throughout the treatment, and feeder systems to apply the toxicant in controlled amounts. Evidence of successful control was indicated first by reduced sea lamprey spawning runs, as measured by the numbers of adults taken at electrical barriers. The runs declined in 1962 by about 86%; periodic re-treatments of lamprey-infested streams held the population at a low level in 1963-70. Other indicators of success were decreases in the incidence of sea lamprey wounds on lake trout (Salvelinus namaycush), in the numbers of sea lamprey larvae in streams and in the number of streams regularly used by sea lampreys for spawning. Although sea lamprey control and heavy plantings of hatchery-reared stock had restored lake trout abundance to pre-lamprey levels in many areas by 1970, the trout had not yet become self-sustaining. Additional effort will be required to further reduce the effects of lamprey predation.--Copyright 1974, Biological Abstracts, Inc.

NATURAL REPRODUCTION OF THE WHITE AMUR IN BODIES OF WATER OF THE LOWER VOLGA, (IN RUSSIAN),
Kaspiiskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Astrakhan (USSR).
K. V. Martino.
Gidrobiol Zh. 10(1), p 91-93, 1974.

Descriptors: *Reproduction, *Fish stocking, Fish behavior, Spawning, Larvae, Fry.
Identifiers: *Ctenopharyngodon-Idella, *USSR(Lower Volga), *White amur.

Systematic stocking of the Lower Volga with fingerlings of the white amur (Ctenopharyngodon idella) began in 1964 after the 1st experimental release of this fish yielded favorable results. Investigations in 1971 and 1972 revealed that natural reproduction has begun in white amur which have matured in the Lower Volga. In all, 937 samples containing 34,036 larvae or early fry were examined. Data are given on the spawning and schooling behavior of the amur.--Copyright 1975, Biological Abstracts, Inc.

THE FISH FAUNA OF THE DJERDAP IMPOUNDMENT IN THE FIRST YEAR AFTER FORMATION, (IN GERMAN),
Bioloski Institut, Belgrade (Yugoslavia).
D. Jankovic.
Arch Hydrobiol Supplementb. 44(3), p364-371, 1974.

Descriptors: *Fish, Carp, *Anadromous fish, Impoundments, Reservoirs.
Identifiers: *Cyprinid fish, Danube River, *Yugoslavia(Djerdap impoundment).

The study and the survey of the changes occurring in the reservoir formed by damming the Danube River at the Iron Gates are of scientific and practical importance. The migration of anadromous fish species from downstream is obstructed; those in the lake migrate into the upper part with faster flow or into the mouths of the tributaries, whereas

the cyprinid fish species become adapted successfully to the newly created conditions.--Copyright 1975, Biological Abstracts, Inc.

Predicting Ionic Distributions in Large Soil Columns,
W76-07234 2G

The Use of Ion Exchange Methods for the Determination of Trace Elements in Natural Waters-I: Cobalt, (In German),
W76-07408 2K

Improved Methods for the Measurement of Dissolved and Particulate Organic Carbon in Fresh Water and Their Application to Chalk Streams,
W76-07428 5A

A Test of the Hypothesis that Abiotic Phosphate Complexing Influences Phosphorus Kinetics in Epilimnetic Lake Water,
W76-07429 5C

Experimental Characterization of Lacustrine Chlorophyll Diagenesis: II. Bacterial, Viral and Herbivore Grazing Effects,
W76-07431 5C

ANIMAL DISEASES
Pathogenic Microorganisms in the Environment,
W76-07156 5C

ANIONS
The Investigation of Ion Removal From Water and Wastewater,
W76-07060 5D

ANOMALOUS WATER
Use of Perturbed Gamma-Gamma Directional Correlations in the Study of Anomalous Water Structure,
W76-06906 1B

ANTEDEGRADATION POLICY
Nebraska Water Quality Standards.
W76-06840 5G

ANTITRANSPIRANTS
Effects of Silicone Antitranspirant on Woody Plants,
W76-07260 2D

APPLES
Use of Cover Crops in Orchards in Connection with the Problem of Water Accumulation in Soils, (In Russian),
W76-07268 3F

APPLICATION METHODS
Increased Water use Efficiency Through Trickle Irrigation,
W76-06904 3F

APPLICATION RATES
Present Knowledge on the Effects of Land Application of Animal Waste,
W76-07199 5D

APPLICATION WATER
Disposal of Beef Feedlot Wastes onto Land,
W76-07184 5D

APPROPRIATION
Montana Water Use Act.
W76-06839 6E

Parke V. Bell (Perfection of Water Right by Diversion of Spring Gives Land Benefitted an Interest Which Is Unaffected by Subsequent Conveyance of Land on Which Spring Is Located).
W76-06860 6E

AQUATIC INSECTS
Studies on the Movement of Salmon and Trout Fry and Invertebrates into Flooded Areas, (In Norwegian),
W76-07285 2I

Study of the Macrozoobenthos of Flood Plain Lakes of the Vakhsh River, (In Russian),
W76-07414 2H

Mass Forms of Chironomid Larvae from the Kayrakkum Reservoir, (In Russian),
W76-07418 2H

AQUATIC LIFE
Ratio Between Cs137 and K Accumulation Coefficients in Freshwater Organisms,
W76-06873 5C

Artificial Radioactivity of Sea Water and Food Hydrobionts of the World Ocean,
W76-06887 5B

AQUATIC PLANTS
The Submersed Macrophytes of the Pamlico River Estuary, North Carolina,
W76-06809 5C

Radioactive Isotopes in the System Water--Freshwater Plants,
W76-06866 5B

The Role of Aquatic Plants in the Migration of Sr90 in Some Water Reservoirs of the Lithuanian SSR,
W76-06868 5B

AQUIFER CHARACTERISTICS
Availability of Ground Water in the Upper Connecticut River Basin, Northern New Hampshire,
W76-07114 7C

Ground-Water Levels on Boston Peninsula, Massachusetts,
W76-07119 7C

AQUIFERS
Baker V Ore-Ida Foods, Inc. (Illegal Mining of Aquifer Under Ground Water Act).

BILGE WASTES
Development of an Oil-Water Pollution Monitoring System,
W76-07092 5A

BIOASSAY
Water Quality and Bioassay Study from Crawford National Fish Hatchery,
W76-07257 5C

BIOASSAYS
Data on the Study of Amphibian Food in the Region of the Middle Flow of the Seversky Donets River, (In Russian),
W76-07271 2I

BIOCHEMICAL OXYGEN DEMAND
Denitrification Method by Biological Method: Relations Between Denitrification and BOD5 (Seibutsugaku teki hoho ni yoru datsu-chisso-ho: datsuchitsu to BOD5 no kankei),
W76-06997 5D

Self-Purification of Some Rivers of the Latvian SSR from Substances Determining the Biochemical Oxygen Demand Value, (In Russian),
W76-07069 5G

Assessment of Water Pollution of the Danube River in the Bulgarian Section (845-375 River KM) According to Indices of the Oxygen Regime, (In German),
W76-07292 5B

BIODEGRADATION
Biodegradation of Polyvinyl Alcohol in Wastewater,
W76-06967 5D

Dynamic Behavior of Vinyl Chloride in Aquatic Ecosystems,
W76-07247 5C

BIOLOGICAL TREATMENT
Method of Biological Purification of Industrial Effluents from Chromates and Bichromates,
W76-06966 5D

Biological Aerobic Purification of Effluent.
W76-06996 5D

Experimental Studies on the Sewage Tertiary Treatment by Rotating Disc Method (Kaiten enbanho ni yoru gesui 3-ji shori no jikkenteki kenkyu),
W76-07000 5D

Awt Plant Cuts Nutrients Economically,
W76-07042 5D

Pilot-Scale Wastewater Treatment Studies,
W76-07045 5D

Model Plant for Biological Removal of Phosphate from Communal Waste Water, III. Biological Phosphate Removal from Communal

Waste Water Preliminarily Cleaned by a Biological Process (Modellverfahren Zur Biologischen Entphosphatung Kommunaler Abwaesser, III. Biologische Entphosphatung Biologisch Vorgereinigten Kommunalen Abwassers Enies Kalerwerkes),
W76-07057 5D

Process for Physically and Biologically Purifying Sewage,
W76-07444 5D

BIOMASS
Comparative Studies of Some Inland Saline Aquatic Ecosystems in North Dakota,
W76-06805 5A

The Introduced Asiatic Clam, Corbicula, in Central Arizona Reservoirs,
W76-07251 2I

Contribution to the Knowledge of the Distribution, Biomass and Drift of the Zooplankton in the Czechoslovak-Hungarian Stretch of the Danube, (In German),
W76-07306 5C

Density and Biomass of Phytoplankton Populations in an Apennine Lake (Lake Santo Parmense) During the Winter Freeze, (In Italian),
W76-07316 5C

BLACK SEA
Accumulation of Radioactive and Stable Zinc by Black Sea Algae Cystoseira Barbata and Ulva Rigida,
W76-06897 5C

BOCA CIEGA BAY (FLA)
Field Studies on Ozone Inactivation of a Gymnodinium Breve Toxin,
W76-07099 5G

BOGS
Variations in the Level Regime of Highmoor Bogs in the European USSR,
W76-07077 2H

Determination of the Permeability of the Peat Deposit of a Lowmoor Bog,
W76-07078 2G

Hydrochemical Regime and Chemical Composition of Oligotrophic Bog Waters,
W76-07079 5B

BOSMINA-LONGIROSTRIS
Study of the Zooplankton of Small Lakes of the Lower Reaches of the Isfairamsai River, (In Russian),
W76-07412 2H

BOSTON PENINSULA (MASS)
Ground-Water Levels on Boston Peninsula, Massachusetts,
W76-07119 7C

BOTTOM SEDIMENTS
Sr90 Distribution in Water and Bottom Sediments of Latvian Lakes,
W76-06871 5B

Sorption of Sr90 by Bottom Sediments of a Freshwater Lake,
W76-06872 5B

Natural Radioelements in Contemporary Bottom Sediments of Estonian Lakes,

LIVESTOCK
Managing Livestock Wastes.
W76-07154 5D

Pathogenic Microorganisms in the Environment,
W76-07156 5C

Economic Research Pertaining to Problems of Livestock Waste Management and Pollution Control,
W76-07157 5G

Evaluation of Dairy, Beef and Swine Waste Handling Systems,
W76-07171 5D

LOADING RATES
Optimum Dilution of Swine Wastes for Growth of Lemna Minor L. and Euglena Sp,
W76-07191 5D

LOCAL GOVERNMENTS
Watkins V Cobb County Commission (No Liability for Performance of Government Function Such as Construction, Installation and Maintenance of Sewer-Drainage System),
W76-07385 6E

LOCATING
Effects of Environmental Legislation of Cattle Feedlot Location,
W76-07159 5G

LONG-TERM PLANNING
Criteria for the Identification of Areas of Environmental Concern Prepared for North Carolina Land Policy Council.
W76-07371 6E

LOS ANGELES HARBOR (CAL)
Durability of Concrete in Seawater,
W76-07218 8F

LOUISIANA
Wood V. Gibson Construction Company, Inc. (Increased Drainage into Adjacent Property).
W76-06850 6E

Gulf Oil Corp V. State Mineral Board (Navigable Water Bottoms Held in Trust by the State for the Public),
W76-07387 6E

LOUISIANA CIVIL CODE ARTICLE 660
Wood V. Gibson Construction Company, Inc. (Increased Drainage into Adjacent Property).
W76-06850 6E

LUMBERING
Sedimentation in Relation to Logging Activities in the Mountains of Central Idaho,
W76-07020 4D

Erosional Effects of Wildfire and Logging in Idaho,
W76-07027 4D

LYSIMETERS
Preparation of Polyester Jacketed Soil Columns as Penetration, Suction Plate and Groundwater Lysimeters, (In German),
W76-07272 2G

MACROPHYTES
The Submersed Macrophytes of the Pamlico River Estuary, North Carolina,
W76-06809 5C

The Improvement of the Ecological Conditions in Frasinet Pond--Intensely Overrun by Macrophytes After Having Stocked it with Grass Carp (Ctenopharyngodon Idella (Val)), (In German),
W76-07296 8I

MAINE
The Direct Titration of Water-Soluble Sulfide in Estuarine Muds of Montsweag Bay, Maine,
W76-07415 5A

MAINTENANCE COSTS
Ahtanum Indian Irrigation Project.
W76-06835 3F

MANAGEMENT
Aeration as a Lake Management Technique,
W76-07103 5C

Environmental Implications of River Basin Development Including Water Quality Management: General Report,
W76-07134 5G

The Integrated River Basin Concept and International Water Resources Management,
W76-07138 4A

Timber Management Influences on Aquatic Ecosystems and Recommendations for Future Research,
W76-07151 5G

Development of Water Quality Management Indices,
W76-07152 5G

MANITOBA
The Role of Two Manitoba Tribunals in Environmental Decision Making,
W76-07028 6G

MANURE STACKING
Properties of Solids and Liquids from Stacked Manure,
W76-07197 5A

MAPPING
Flood Plains of the South Branch Shiawassee River, Livingston County, Michigan,
W76-07113 2E

Nebraska Flood-Plain Management Program--Part II,
W76-07216 6F

MARINE ALGAE
Comparative Evaluation of the Accumulation Dynamics of Some Corrosion and Fission Group Radionuclides and Alpha Emitters by Northern Marine Algae,
W76-06893 5C

On Th234 Accumulation by Marine Organisms,
W76-06898 5C

Mathematical Model of Sr90 Exchange Between Cystoseira and Marine Water,
W76-06899 5C

The Role of Some Polysaccharides of Brown Algae in the Extraction of SR90 from Sea Water,
W76-06901 5C

Influence of Salinity and Concentration of Sr and Ca in Water on the Sr90 Accumulation by Cystoseira,
W76-06903 5C

MARINE MICROORGANISMS
Radioecologo-Biochemical Approach to the Study of the Cobalamine Cycle in the Ocean,
W76-06900 5C

MARINE SOIL MECHANICS
Marine Soil Mechanics,
W76-07321 8D

MARSHES
Variations in the Level Regime of Highmoor Bogs in the European USSR,
W76-07077 2H

Holden V. Lesueur County (Requirement of Public Water Determination by Dept. of Nat. Resources for Establishment of Drain),
W76-07393 6E

MARYLAND
Economic Efficiency and Equity in Water Quality Control: Effluent Taxes and Information Requirements,
W76-07141 5G

MASS SPECTROMETRY
The Application of Spark Source Mass Spectrometry to the Analysis of Water Samples,
W76-06945 5A

MASS TRANSFER
A Comparison of Glacier Mass Balance by Glaciological, Hydrological and Mapping Methods, South Cascade Glacier, Washington,
W76-07125 2C

MASSACHUSETTS
Ground-Water Levels on Boston Peninsula, Massachusetts,
W76-07119 7C

MATHEMATICAL MODELS
Analysis and Optimization of a Multi-Effect Multi-Stage Flash Distillation System,
W76-06802 3A

Mathematical Model of Sr90 Exchange Between Cystoseira and Marine Water,
W76-06899 5C

Ciria Assesses its Model Way to Treat Sewage.
W76-07014 5D

A Three-Dimensional Model for Estuaries and Coastal Seas: Volume III, the Interim Program,
W76-07016 2L

Econometric Model to Aid in Urban Planning Decisions,
W76-07232 6A

Identification of Parameters in Transient Water Quality Models from Stochastic Data,
W76-07395 5G

MEAN HIGH WATER LINE
Environmental Law- The 1972 Amendments to the Federal Water Pollution Control Act Extend Dredge and Fill Jurisdiction Above the Mean High Water Line. United States v. Holland, 373 F. Supp. 665 (MD Fla. 1974).
W76-06820 5G

MEASUREMENT
Throughflow Measurements in Water and Waste Water Technology (Durchflussmessung In Der Wasser- Und Abwassertechnik).
W76-07004 5

Improved Methods for the Measurement of Dissolved and Particulate Organic Carbon i

Fresh Water and Their Application to Chalk Streams,
W76-07428 5A

MELT WATER
On the Water Channels of the Internal Drainage System of the Hintereisferner, Otztal Alps, Austria,
W76-07064 2C

MEMBRANE PROCESSES
Development of Non-Cellulosic RO Systems for Sea Water Desalting,
W76-07318 3A

Final Report (Dec 74-July 75) Pilot Plant Operations, Roswell Test Facility, Roswell, New Mexico.
W76-07319 3A

Apparatus for Control of a Reverse Osmosis System,
W76-07440 3A

Method for Cleaning Semipermeable Membranes,
W76-07446 3A

MEMBRANES
Final Report (Dec 74-July 75) Pilot Plant Operations, Roswell Test Facility, Roswell, New Mexico.
W76-07319 3A

MESOPHILIC CLOSTRIDIA
Mesophilic Clostridia in Puget Sound,
W76-07255 5C

METABOLISM
Studies on Metabolic Activity of Planktonic Bacteria Isolated from Three Lakes,
W76-07097 5C

METALS
Is Collective Waste Treatment the Answer to 1983,
W76-06962 5D

EPA Grant Helps Determine the Feasibility of Recycling Cyanide Zinc Plating Sludge,
W76-06964 5D

Coating Factory's Grouping in the City Area and Environmental Pollution Control (Kisei shigaichi ni sonritsu suru mekki kojo no shudanka to kogai taisaku),

W76-06915 4A

Report of the Ocean Policy Research Workshop,
W76-07367 6E

NORTH CAROLINA

The Submersed Macrophytes of the Pamlico River Estuary, North Carolina,
W76-06809 5C

Criteria for the Identification of Areas of Environmental Concern Prepared for North Carolina Land Policy Council.
W76-07371 6E

Williams V. Duke Power Co. (No Liability for Silting of Pond and Stream by Destruction of Vegetation on Right of Way),
W76-07388 6E

NORTH DAKOTA

Wildlife, Ecology and Planning in a Proposed Irrigation System,
W76-06804 4C

Comparative Studies of Some Inland Saline Aquatic Ecosystems in North Dakota,
W76-06805 5A

Evaluation of Alternative uses of Wetlands,
W76-06908 3F

NORTH SEA

Sr90 and Cs137 in Surface Waters of the Baltic, North, Irish, and Norway Seas,
W76-06889 5B

Suspended-Sediment Sampling Towers as used on the Intertidal Flats of the Wash, Eastern England,
W76-07087 2L

NORWAY

Zooplankton Diversity in Four Norwegian Fjords,
W76-07102 5C

Studies on the Movement of Salmon and Trout Fry and Invertebrates into Flooded Areas, (In Norwegian),
W76-07285 2I

NORWAY (HAUGATJERN)

What Should be Done with Haugatjern, (In Norwegian),
W76-07401 5C

NORWAY SEA

Sr90 and Cs137 in Surface Waters of the Baltic, North, Irish, and Norway Seas,
W76-06889 5B

NORWAY (TROUDHEIM FJORD)

Investigation of Trondheim Fjord: Orientation to Planning and Preliminary Results, (In Norwegian),
W76-07405 5A

NOVA SCOTIA ENVIRONMENTAL ACT

A Critical Evaluation of the Nova Scotia Environmental Protection Act,
W76-07365 5G

NUCLEAR ENERGY

Siting of Energy Facilities in the Coastal Zone - - A Critical Regulatory Hiatus,
W76-06819 6G

NUCLEAR POWERPLANTS

Fish Impingement at Monticello Nuclear Plant,
W76-07211 8

NUCLEAR REACTORS

Flood Protection of Crystal River Unit Nuclear Plant,
W76-07210 4A

NUCLEAR SPECTROSCOPY

Use of Perturbed Gamma-Gamma Directiona Correlations in the Study of Anomalous Wate Structure,
W76-06906 1

NUCLEAR WASTES
Environmental Law - Statutory Interpretation - The Environmental Protection Agency Enters the Nuclear Age -- Colorado Public Interest Research Group, Inc. V. Train 507 F2d 743 (10th Cir. 1974),
W76-07362 6E

NUCLEATION
Some Remarks on Modeling of the Early Stages of Cloud Formation in a Simulation Chamber,
W76-07070 2B

NUISANCE (LEGAL ASPECTS)
Mowrer V. Ashland Oil and Ref. Co. (Assessment of Damages for Oil Co's Water-flood Operation).
W76-06852 6E

NUMERICAL METHODS
A Three-Dimensional Model for Estuaries and Coastal Seas: Volume III, the Interim Program,
W76-07016 2L

NUTRIENT LOSSES
Nutrient Losses from Manure Under Simulated Winter Conditions,
W76-07187 5B

NUTRIENT RECOVERY SYSTEM
Swine Waste Nutrient Recovery System Based on the Use of Thermal Discharges,
W76-07179 5D

NUTRIENT REMOVAL
Study of the Removal of Phosphate from Waste Water by Lime (Untersuchungen Zur Abwasserentphosphatung Durch Einsatz Von Kalk),
W76-06999 5D

Model Plant for Biological Removal of Phosphate from Communal Waste Water, III. Biological Phosphate Removal from Communal Waste Water Preliminarily Cleaned by a Biological Process (Modellverfahren Zur Biologischen Entphosphatung Kommunaler Abwaesser, III. Biologische Entphosphatung Biologisch Vorgereinigten Kommunalen Abwassers Enies Kalerwerkes),
W76-07057 5D

Ferric Chloride and Organic Polyelectrolytes for the Removal of Phosphorus,
W76-07059 5D

The Investigation of Ion Removal From Water and Wastewater,
W76-07060 5D

NUTRIENTS
Streamflow Chemistry and Nutrient Yields from Upland Peatland Watersheds in Minnesota,
W76-07022 2K

Nutrients and Primary Production in a Warm Water Stream,
W76-07104 5C

Nutrient Concentrations of Surface Waters in Southern Florida, September 1970 to April 1975,
W76-07126 5A

Effectiveness of Forest Buffer Strips in Improving the Water Quality of Manure Polluted Runoff,
W76-07189 5B

Comparative Primary Productivity of Two Flood Control Reservoirs in the Salt Valley Watershed of Eastern Nebraska,
W76-07254 5C

Use of the Bulrush in Water Management, (In Russian),
W76-07449 4A

NYMPHAEACEAE
Distribution, Phytocenology and Productivity of Nymphaeaceae in Reservoirs of the Dnieper Cascade, (In Ukranian),
W76-07314 5C

OBSTRUCTION TO FLOW
Mid-America Terminal of Kentucky, Inc. V Owensboro River Sand and Gravel Co (Owner's Dredging Not a Trespass on Lessor's Estate in Sand and Gravel Located in River Bed on Same Land).
W76-06841 6E

TRAX, Inc. V City of College Park (Responsibility of Landowner for Removal of Landowner's Obstruction in Creek Which Is Major Part of City Drainage).
W76-06842 6E

OCEAN DUMPING
Environmental Policy and the Ocean,
W76-07339 6E

OCEAN REGIME
Perspectives on Ocean Policy; Conference on Conflict and Order in Ocean Relations, Airlie, Va., October 21-24, 1974.

SOUTH AFRICA (SOUTH RIVER SUNDAY RIVER)
The Trichoptera of the Sundays and Fish Rivers, Eastern Cape Province, South Africa,
W76-07417 5C

SOUTH BRANCH SHIAWASSEE RIVER (MICH)
Flood Plains of the South Branch Shiawassee River, Livingston County, Michigan,
W76-07113 2E

SOUTH CAROLINA
Feedlot Waste Recycling with a Flush Cleaning System,
W76-07170 5D

State V. Griffith (Requirement to Have Tideland Title: Conveyance to Low Water Mark),
W76-07389 6E

State V Yelsen Land Company, Inc. (Requirement of Conveyance of Title to Low Water Mark to Have Tideland Title),
W76-07390 6E

SOUTH CASCADE (WASH)
A Comparison of Glacier Mass Balance by Glaciological, Hydrological and Mapping Methods, South Cascade Glacier, Washington,
W76-07125 2C

SOUTH FORK SALMON RIVER (IDAHO)
Time Trends in Riverbed Sediment Composition in Salmon and Steelhead Spawning Areas: South Fork Salmon River, Idaho,
W76-07018 2J

SPARK SOURCE MASS SPECTROMETRY
The Application of Spark Source Mass Spectrometry to the Analysis of Water Samples,
W76-06945 5A

SPATIAL DISTRIBUTION
Spatial Variability of the Leaching Characteristics of a Field Soil,
W76-07089 2G

SPECIFIC ACTIVITY
Environmental Na22 in Freshwater Ecosystem Studies,
W76-06874 5C

SPECIFIC CONDUCTIVITY
Specific Conductance Identifies Perched and Ground Water Lakes,
W76-07023 2H

SPECTRAL DENSITY
An Exploratory Application of Two Methods of Analyzing Water Use Time Series,
W76-06813 6D

SPECTROSCOPY
Use of Perturbed Gamma-Gamma Directional Correlations in the Study of Anomalous Water Structure,
W76-06906 1B

SPECTRUM ANALYSIS
Prediction of Wind Wave Heights,
W76-07229 8B

SPILLWAYS
Spillway for Little Goose Dam, Snake River, Washington, Hydraulic Model Investigation,
W76-07094 8B

Little Goose Dam, Snake River, Washington, Hydraulic Model Investigation,
W76-07095 8A

A History of Bureau of Reclamation Construction- Part I,
W76-07222 8A

SPOIL BANKS
Potential of Mine and Mill Spoils for Water Quality Degradation,
W76-06949 5B

Ground Water Leaching of Jig Tailing Deposits in the Coeur D'Alene District of Northern Idaho,
W76-06951 5B

Ground-Water Movement Through an Abandoned Tailings Pile,
W76-06952 5B

SPRING WATERS
Parke V. Bell (Perfection of Water Right by Diversion of Spring Gives Land Benefitted an Interest Which Is Unaffected by Subsequent Conveyance of Land on Which Spring Is Located).
W76-06860 6E

SPRINGS
Microflora of the Waters of one of the Underground Springs of the Karakalpak ASSR, (In Russian),
W76-07280 5B

SPRINKLER IRRIGATION
Pop-up Sprinkler Head Having Flow Adjustment Means,
W76-07442 3F

SQUID PROCESSING WASTES
Water Treatment in Squid Processing Wastes: I. Waste Water Quality, (In Japanese),
W76-07266 5A

STABILIZATION
Stabilization Pond Upgrading with Intermittent Sand Filters,
W76-07050 5D

Performance of Raw Waste Stabilization Lagoons in Michigan with Long Period Storage Before Discharge,
W76-07052 5D

STANDARDS
Report of Working Group B: Promulgation of Environmental Quality Standards.
W76-07030 6G

STANDING WATERS
Distribution and Migration of Sr90 in an Experimental Still Water Reservoir,
W76-06879 5B

STATE ESTIMATION
Use of State Estimation Techniques in Water Resource System Modeling,
W76-07143 5B

STATE GOVERNMENTS
Achieving Federal-State Coordination in Coastal Resources Management,
W76-07359 6E

The Concept of State and Local Relations Under the CZMA,
W76-07360 6E

STATISTICAL ANALYSIS
Reverse Osmosis of Treated and Untreated Secondary Sewage Effluent; Appendix A-2 and Appendix A-6,
W76-07061 5D

STATISTICAL METHODS
Covariance Functions and Spectra of a Random Wave Field,
W76-06931 2L

Cost and Pricing Relationships in Water Supply,
W76-07145 3D

Statistical Study of Phosphorus Removal in Wisconsin,
W76-07146 5A

Statistical Design Basis for Submerged Diffuser,
W76-07214 5B

STEEL
Using Corrugated Steel to Slash Sewer Cost by 12%,
W76-06984 5D

STEEL BEAMS
Dynamic Behavior of Box-Girder Jetties,
W76-07208 8A

STOCHASTIC ANALYSIS
Decision Analysis for Watershed Management Alternatives,
W76-06905 4D

STOCHASTIC PROCESSES
The Role of Predictions in Water Resources Policy Making,
W76-07136 4A

Identification of Parameters in Transient Water Quality Models from Stochastic Data,
W76-07395 5G

STORAGE
Performance of Raw Waste Stabilization Lagoons in Michigan with Long Period Storage Before Discharge,
W76-07052 5D

STORM DRAINS
The Helical Bend Combined Sewer Overflow Regulator,
W76-07246 5D

STORM RUNOFF
Thomas V Hale County (No Injunction for Diversion of Natural Water Flow Which Causes Minimal Damages).
W76-06844 6E

Recognition and Prediction of Runoff-Producing Zones in Humid Regions,
W76-07073 2E

STORM SEWERS
Using Corrugated Steel to Slash Sewer Cost by 12%,
W76-06984 5D

STORM SURGE
Flood Protection of Crystal River Unit 3 Nuclear Plant,
W76-07210 4A

STREAM EROSION
Time Trends in Riverbed Sediment Composition in Salmon and Steelhead Spawning Areas: South Fork Salmon River, Idaho,
W76-07018 2J

Sediment Storage in Channels Draining Small Forested Watersheds in the Mountains of Central Idaho,
W76-07019 4D

STREAMFLOW
Comparison of the Georgia Tech, Kansas, Kentucky, Stanford and TVA Watershed Models in Georgia,
W76-06806 2A

Streamflow Chemistry and Nutrient Yields from Upland Peatland Watersheds in Minnesota,
W76-07022 2K

Water Resources Data for California, 1974: Part 1. Surface Water Records--Volume 1.
W76-07121 7C

Surface Water Supply of the United States, 1966-70: Part 5. Hudson Bay and Upper Mississippi River Basins--Volume 1. Hudson Bay Basin.
W76-07122 7C

STREAMS
Preplanning Mining Operations to Reduce the Environmental Impact of Mine Drainage on Streams,
W76-06939 5G

Williams V. Duke Power Co. (No Liability for Silting of Pond and Stream by Destruction of Vegetation on Right of Way),
W76-07388 6E

STREPTOCOCCUS
Effectiveness of Forest Buffer Strips in Improving the Water Quality of Manure Polluted Runoff,
W76-07189 5B

STRESS ANALYSIS
Stability of Rock Slopes in Mining and Civil Engineering Situations,
W76-07322 8E

STRONTIUM
On Sr90 Migration in Land Fresh Water,
W76-06864 5B

STRONTIUM

Effects of Some Natural Factors on the Transition of Sr90 from the Soil Cover to Surface Waters,
W76-06865 5B

Sr90 in Water, Bottom, and Water Organisms in Latvian Lakes of Various Types,
W76-06867 5B

The Role of Aquatic Plants in the Migration of Sr90 in Some Water Reservoirs of the Lithuanian SSR,
W76-06868 5B

Study of Sr90/Sr Ratio in a Latvian Seaside Lake,
W76-06869 5C

Sr90/Sr Ratio in Plankton of Latvian Lakes of Various Types,
W76-06870 5C

On Accumulation of Sr90 and Cs137 by Some Fish Species in Freshwater Reservoirs,
W76-06876 5C

Distribution and Migration of Sr90 in an Experimental Still Water Reservoir,
W76-06879 5B

Uptake of Sr90 by Organisms of Gammarus Sp and Chironomus F. L. Plumosus L.,
W76-06881 5C

Migration of Sr90 from Fish Organisms into Offsprings,
W76-06883 5C

Sr90 in the Water-Atmosphere Interface,
W76-06888 5B

Sr90 and Cs137 in Surface Waters of the Baltic, North, Irish, and Norway Seas,
W76-06889 5B

Cs137 and Sr90 in the Sea of Azov,
W76-06890 5B

Mechanisms of Accumulation of Radioactive and Stable Sr by Northern Marine Algae Under Natural and Experimental Conditions,
W76-06892 5C

Radioactive Contamination of commercial Hydrobionts of the Western Basin,
W76-06894 5C

Accumulation of Sr90, Ca, and Sr By Fish in Seas And Oceans,
W76-06896 5C

Mathematical Model of Sr90 Exchange Between Cystoseira and Marine Water,
W76-06899 5C

The Role of Some Polysaccharides of Brown Algae in the Extraction of SR90 from Sea Water,
W76-06901 5C

STRONTIUM RADIOISOTOPES

Study of Sr90/Sr Ratio in a Latvian Seaside Lake,
W76-06869 5C

Sr90/Sr Ratio in Plankton of Latvian Lakes of Various Types,
W76-06870 5C

Sr90 Distribution in Water and Bottom Sediments of Latvian Lakes,
W76-06871 5B

Sorption of Sr90 by Bottom Sediments of a Freshwater Lake,
W76-06872 5B

STRONTIUM RADIOSISOTOPES

On Accumulation of Sr90 and Cs137 by Some Fish Species in Freshwater Reservoirs,
W76-06876 5C

STRUCTURAL ENGINEERING

Durability of Concrete in Seawater,
W76-07218 8F

SUBMERGED AQUATIC PLANTS

Investigations on the CO2 Balance of Submerged Higher Water Plants in Running Water by Means of a Mobile Laboratory for Infrared Gas Analysis, (In German),
W76-07312 2I

SUBMERGED ROCK FILTERS

Polishing Lagoon Effluents with Submerged Rock Filters,
W76-07049 5D

SUBSURFACE INJECTION

On Land Disposal of Liquid Organic Wastes Through Continuous Subsurface Injection,
W76-07203 5D

SUBSURFACE RUNOFF

Recognition and Prediction of Runoff-Producing Zones in Humid Regions,
W76-07073 2E

SUEZ CANAL

The Red Sea Lights Agreement: Another Instance of International Cost-Sharing,
W76-07366 6E

SUGAR PROCESSING

Environmental Protection Agency - Sugar Processing Point Source Category (Interim Rule).
W76-06831 5G

SULFATE ATTACK

Durability of Concrete in Seawater,
W76-07218 8F

SULFATES

Acidity, Acid Sulphate Soils and Liming of Padi Fields,
W76-07227 3C

SULFIDES

The Direct Titration of Water-Soluble Sulfide in Estuarine Muds of Montsweag Bay, Maine,
W76-07415 5A

SUNSHINE

Stomach Cancer and Ecologic Factors in Japan,
W76-07424 5C

SURFACE RUNOFF

Hoff V. Ehrlich (Dominant Estate's Right to Drainage Easement for Natural and Waste Water Across Servient Estate).
W76-06856 6E

SURFACE WATERS

Diffused Surface Waters in Mississippi,
W76-06823 6E

Water Resources of the Lake of the Woods Watershed, North-Central Minnesota,
W76-07115 7C

Water Resources of the Cedar River Watershed, Southeastern Minnesota,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 9, NUMBER 15
AUGUST 1, 1976

W76-07451 -- W76-08100
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 9, NUMBER 15
AUGUST 1, 1976

W76-07451 -- W76-08100

he Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the ansaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

RUNOFF STUDIES ON SMALL WATERSHEDS,
West Virginia Univ., Morgantown. Water Research Inst.
J. C. Burchinal.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 933, $3.50 in paper copy, $2.25 in microfiche. Information Report 4, (WRI-WVU-76-02) 1976. 12 p, 2 ref. OWRT A-003-WVA(4). 14-01-0001-1417.

Descriptors: *Evapotranspiration, *Model Studies, *Peak discharge, *Small watersheds, *Storm runoff, Agricultural runoff, Agricultural watersheds, *Demonstration watersheds, Hydrology, Methodology, Rainfall, Rainfall-runoff relationships, Runoff, Surface runoff, *West Virginia.

Three small experimental watersheds were constructed in 1966. The watersheds cover about 10, 15, and 46 acres, and none contained a stream. Long-term data collection and a series of basic studies on this size watershed began. This report chiefly covers the results of two of these studies - (1) model selection for frequency analysis of runoff data and (2) evapotranspiration as a function of meteorological conditions and soil water. The model of Gumbel proved to be the most preferred and that of Gringorten the least. Adaptations were made for small watersheds in West Virginia. Relationships between actual evapotranspiration, potential evapotranspiration, soil moisture, available water, net radiation, pan evaporation, and other factors were established for the watersheds. Ninety-two percent of the variation in actual evapotranspiration could be accounted for by using potential evapotranspiration and available water as the independent variables in a multiple regression equation, giving a standard error of 0.11 inches. The methodology was specially adapted to analysis of very small watersheds in West Virginia. (Dodson-West Virginia)

PREDICTING SNOWMELT RUNOFF USING A DETERMINISTIC WATERSHED MODEL WITH STOCHASTIC PRECIPITATION INPUTS,
Arizona Univ. Tucson. School of Renewable Natural Resources.
W. Hanes.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-252 858, $5.00 in paper copy, $2.25 in microfiche. M. S. Thesis, 1975. 83 p, 17 fig, 8 tab, 32 ref, 3 append. OWRT B-032-ARIZ.(22) 14-31-0001-3858.

Descriptors: Watershed management, *Decision making, *Water yield, *Snowmelt, *Model studies, Forecasting, Stochastic processes, Synthetic hydrology, *Runoff forecasting, Data processing, Simulation analysis, Precipitation(Atmospheric).
Identifiers: *Stochastic analysis.

The accuracy of currently used long-term runoff forecasting techniques, such as used by the Soil Conservation Service, are limited because of their inability to deal with the uncertainty in the amount of precipitation expected to fall after the forecast date. The basis for a simulation-based, long-term runoff forecasting technique is developed to overcome this problem by simulating future precipitation events. The technique utilizes a deterministic watershed snowmelt model and a sequence, event-based stochastic precipitation model to provide daily precipitation data inputs for the watershed model. A number of sets of inputs are run through the watershed model to produce an equal number of predictions of total seasonal runoff. A relative frequency distribution of total seasonal runoff is then plotted to which a PDF may be fitted. Various criteria were used to test the precipitation model. The majority showed no significant differences between the observed and simulated data. The lack of data prevented reasonable watershed model optimization and testing. Taking into consideration the poor watershed model response the forecasting technique responded will to the uncertainty in future precipitation and to abnormal monthly precipitation.

SEASONAL VARIATIONS AND STATIONARITY,
Iceland Univ., Reykjavik. Science Inst.
G. Gudmundsson.
Nordic Hydrology, Vol. 6, No. 3, p 137-144, 1975. 2 tab, 9 ref.

Descriptors: *Analysis, *Hydrologic data, *Time series analysis, Seasonal, *Variability, Evolution, Discharge measurement, Temperature, Precipitation(Atmospheric), Climates, Groundwater, Rivers, Thawing, Discharge(Water).
Identifiers: *Seasonal variations, *Stationarity, *Iceland, Evolutionary spectra.

A method was presented for testing second order stationarity against the alternative that seasonal variations take place in the autocovariance function. This was a modification of a test suggested by Priestly and Rao (1969) based on the concept of 'evolutionary spectra'. The method was applied to actual series of monthly data of discharge, temperature, and precipitation. Seasonal variations in mean and variance were eliminated before the test was applied, but highly significant seasonal variation was still present in some series. The observations had to be carried out over an interval of time long enough to enable satisfactory estimation of the relevant statistical process. Also, the second order properties of the series had to be almost constant during the interval of observations. (Roberts - ISWS)

HYDROLOGY OF THE NORTH CASCADES REGION, WASHINGTON: 1. RUNOFF, PRECIPITATION, AND STORAGE CHARACTERISTICS,
Geological Survey, Tacoma, Wash.
L. A. Rasmussen, and W. V. Tangborn.
Water Resources Research, Vol 12, No 2, p 187-202, April 1976. 10 fig, 7 tab, 6 ref.

Descriptors: *Streamflow forecasting, *Hydrology, Hydrologic data, *Washington, Equations, Data collections, Evaluation, Methodology, Stream gages, Ice, Snow, Altitude, Topography, Physical properties.
Identifiers: *North Cascade region(Wash).

The time and space distributions of measured precipitation and measured runoff and of spring storage, which is approximately equal to the subsequent summer runoff of snowmelt and stored groundwater, have been analyzed for the North Cascades region of Washington. Neither precipitation nor runoff shows a consistent relationship with altitude, chiefly because of precipitation-shadowing effects in this region of high relief. The relationship between mean annual precipitation and altitude is improved considerably when a topographic mean altitude is used instead of the actual altitude of the weather station. However, the improvement is not sufficient to explain a number of discrepancies that still occur. Some of the scatter in a precipitation-altitude plot appears to be due to a deficient precipitation catch by high-altitude gages. When the dependence of runoff on precipitation was examined on an annual, seasonal, and monthly basis, only a few low-altitude gages correlated well with basin runoff. In several instances, annual (water year) runoff could be better predicted from winter precipitation than from annual precipitation. (See also W76-08060) (Woodard-USGS)
W76-08059

HYDROLOGY OF THE NORTH CASCADES REGION, WASHINGTON: 2. A PROPOSED HYDROMETEOROLOGICAL STREAMFLOW PREDICTION METHOD,
Geological Survey, Tacoma, Wash.
W. V. Tangborn, and L. A. Rasmussen.
Water Resources Research, Vol 12, No 2, p 203-216, April 1976. 4 fig, 8 tab, 19 ref.

Descriptors: *Streamflow forecasting, *Model studies, *Hydrology, *Meteorology, *Washington, Methodology, Hydrologic data, Regression analysis, Hydrologic cycle, Snow, Ice, Rainfall.
Identifiers: *North Cascades region(Wash).

On the basis of a linear relationship between winter (October-April) precipitation and annual runoff from a drainage basin (Rasmussen and Tangborn, 1976) a physically reasonable model for predicting summer (May-September) streamflow from drainages in the North Cascades region in Washington was developed. This hydrometeorological prediction method relates streamflow for a season beginning on the day of prediction to the storage (including snow, ice, soil moisture, and groundwater) on that day. The spring storage is inferred from an input-output relationship based on the principle of conservation of mass: spring storage equals winter precipitation to the basin less winter runoff from the basin and less winter evapotranspiration. The method of prediction is based on data only from the years previous to the one for which the prediction is made,

and the system is revised each year as data for the previous year become available. Standard precipitation and runoff measurements in the North Cascades region are adequate for constructing a predictive hydrologic model. This model can be used to make streamflow predictions that compare favorably with current multiple regression methods based on mountain snow surveys. This method has the added advantages of predicting the space and time distributions of storage and summer runoff. (See also W76-08059) (Woodard-USGS)
W76-08060

DESIGN FLOOD SYNTHESIS BY EXCESS RAIN ROUTING,
Witwatersrand, Johannesburg, Africa, Department of Civil Engineering.
S. W. Bauer, and D. C. Midgley.
The Civil Engineer in South Africa, Vol. 17, No. 8, p 199-202, August 1975. 4 fig, 3 tab, 5 ref.

Descriptors: *Design blood, *Floods, *Rainfall, *Routing, Equations, Hydrographs, Reservoir storage, Drainage, Evaluation, Design storm, Maps, Hyetographs, Systems analysis, Africa.
Identifiers: South Africa.

Trials of several routing procedures for hydrograph synthesis revealed that routing of the excess rain hyetograph through a single linear reservoir-type storage could yield a plausible direct runoff hydrograph provided the shape and drainage pattern of the catchment was not abnormal. The method requires evaluation of only one parameter, the routing constant K, to define the hydrograph for an excess rain of given depth and duration. K values were determined for 92 South African catchments by seeking best-fits between routed and observed unitgraphs. To aid estimation of K for ungauged catchments, the country was subdivided into veld-type zones for each of which a relationship between K and area of catchment is provided. A worked example demonstrates the method. (Bell-Cornell)

FLOOD PEAK ESTIMATES FROM SMALL RURAL WATERSHEDS,
Federal Highway Administration, Washington, D. C.
D-C Woo.
Public Roads, Vol. 38, No. 3, p 117-122, December 1974. 1 fig, 18 ref.

Descriptors: *Highways, *Drainage, *Estimating, *Floods, *Hydrographs, Streams, Flood peak, Hydrologic data, Rural areas, Design, Simulation analysis, Research, Runoff, Rainfall.

The design of highway drainage structures depends on accurate estimates of flood hydrographs of streams that cross highways. This article describes the special characteristics of small rural watersheds and the Federal Highway Administration's extensive involvement in a program of small-stream gaging, data analysis, and methods development for such estimates. Available data on rainfall and streamflow from small rural watersheds are insufficient, and the geographical distribution of streamflow data is extremely poor. These conditions greatly hamper progress toward development of accurate general methods for estimation of flood peaks from small rural watersheds for nationwide use. However, better method for estimation of flood peaks can be developed for local use on the basis of marginal local data by researchers who know the area well. Accurat and sound methods of estimating flood peaks from small rural watersheds must be developed. This will require action on several fronts. The current program of national rainfall and streamflow data collection for small rural watersheds should be greatly expanded. Methods of generating more adequate local rainfall data should be studied. The best stratification schemes for regional analysis should be identified and accurate regional and local models should be developed. (Bell-Cornell)
W76-08077

2B. Precipitation

THERMAL SHOCK AS AN ICE MULTIPLICATION MECHANISM. PART I. THEORY,
New England Univ., Armidale (Australia). Dept. of Physics.
W. D. King, and N. H. Fletcher.
Journal of the Atmospheric Sciences, Vol. 33, No. 1, p 85-96, January 1976. 8 fig, 28 ref, 2 append.

Descriptors: *Ice, *Crystals, *Drops(Fluids), Rime, Physical properties, Cloud physics, *Thermal stress, Model studies, Mathematical models, Temperature, Precipitation(Atmospheric), Meteorology, Elastic theory.
Identifiers: *Ice crystal fractures, Thermoelastic theory.

Thermoelastic theory was used to calculate thermal stresses in ice crystals of idealized shapes when a small area on one surface is warmed to 0C, in simulation of riming of the crystal by a cloud droplet. It was shown that a typical riming event involving a 20 micrometer diameter droplet impinging on a 500 micrometer plate or column would need to occur at a temperature colder than -35C before fracture could be expected. For a given ice crystal size, the thermal stresses increase with droplet diameter, and thin thin plates rimed by large droplets are the most sensitive to thermal shock, but still need to be coler than -10C before fracture would occur. It was consequently concluded that the thermal shock mechanism is unlikely to be responsible for the proliferation of ice crystals in clouds at temperatures as warm as -4C. (See also W76-07548) (Sims - ISWS)
W76-07547

THERMAL SHOCK AS AN ICE MULTIPLICATION MECHANISM. PART II. EXPERIMENTAL,
New England Univ., Armidale (Australia). Dept. of Physics.
W. D. King, and N. H. Fletcher.
Journal of the Atmospheric Sciences, Vol. 33, No. 1, p 97-102, January 1976. 8 fig, 3 ref.

Descriptors: *Ice, *Crystals, *Drops(Fluids), Rime, Physical properties, Cloud physics, *Thermal stress, Laboratory tests, Temperature, Precipitation(Atmospheric), Meteorology, Testing procedures.
Identifiers: *Ice crystal fractures.

Thermal shock tests were conducted on large numbers of ice spheres and plates, all of macroscopic size. The thermal shock was applied by cooling the specimens to the desired temperature, and then rapidly warming part of one surface by bringing water in contact with it. The spheres had a median cracking temperature of -16C, and comparison with thermoelastic theory yielded tensile strength values for ice in the range 20-30 bars. Initiation of cracking in thick plates was a function of the temperature and of the ratio a/b (ratio of radius of warmed area to that of the cylindrical plate). For a/b=0.6, -20C was the critical temperature, but for a/b less than 0.2, which is a more appropriate scaling factor in terms of riming of cloud particles, the samples had to be colder than -35C before any cracks appeared. None of the samples fragmented or separated. Because the experimentally applied temperature changes were more severe than would be experienced by rimed ice crystals in clouds, it was concluded that thermal shock is unlikely to be an important ice multiplication mechanism at -5C. (See also W-76 07547) (Sims - ISWS)

WARM RAIN, GIANT NUCLEI AND CHEMICAL BALANCE-A NUMERICAL MODEL,
National Center for Atmospheric Research, Boulder, Colo.
T. Takahashi.
Journal of the Atmospheric Sciences, Vol. 33, No. 2, p 269-286, February 1976. 17 fig, 64 ref. NSF GA-41024, ONR N00014-67-A-0387-0015.

Descriptors: *Model studies, *Cloud physics, *Rainfall, *Salts, Nucleation, Raindrops, Particle size, Tropical regions, Mathematical models, Clouds, Precipitation(Atmospheric), Condensation, Atmospheric physics, Chemistry of precipitation, Meteorology.
Identifiers: *Warm rain, *Giant nuclei, Raindrop size distributions, Terminal velocity, Liquid water content, Cloud droplet distributions, Salt content.

The role of giant nuclei in initiating warm rain was studied in a one-dimensional, time-dependent cylindrical model. Drop growth from cloud nuclei to raindrops through condensation and collection was calculated by keeping track of the salt mass in drops and by including scavenging of particles by drops. Drop distribution and salt content in rainwater were in reasonably good agreement with observations. It appears that while giant nuclei are important for chemical balance during cloud development, they are not important for warm rain initiation. Instead, cloud droplet concentration seems to be a more critical factor in initiating warm rain. (Sims - ISWS)

SMALL SCALE TOPOGRAPHICAL INFLUENCES ON PRECIPITATION,
Norwegian Defense Research Establishment, Kjeller.
P. B. Storebo.
Tellus, Vol. 28, No. 1, p 45-59, 1976. 11 fig, 5 tab, 14 ref.

Descriptors: *Rainfall, *Precipitation(Atmospheric), *Topography, Orography, Rainfall disposition, Rain drops, Fallout, Nucleation, Model studies, Mathematical models, Computer models, Cloud physics, Meteorology.

Small clouds may form above small hills when moist air blows over a landscape. Removal of droplets from these clouds by raindrops from above is the only suggested mechanism which directly links rainfall patterns to small scale topographical features. This mechanism was examined theoretically, and results from a series of computations were presented. The properties of condensation nuclei were found to be of minor importance for the condensation development, because the activation of nuclei dwindles off when enough droplets have been formed, and because a droplet assembly is an instable phenomenon. Additional rainfall over small hills was found to be sufficiently large to explain observed influences of small scale terrain features on precipitation in Scandinavia. (Sims - ISWS)
W76-07556

THE BEHAVIOR OF LARGE, LOW-SURFACE-TENSION WATER DROPS FALLING AT TERMINAL VELOCITY IN AIR,
Little (Arthur D.), Inc., Cambridge, Mass.
R. T. Ryan.
Journal of Applied Meteorology, Vol. 15, No. 2, p 157-165, February 1976. 12 fig, 23 ref. DAHCO-07-C-0061.

Descriptors: *Drops(Fluids), *Raindrops, *Laboratory tests, Settling velocity, Equipment, Laboratory equipment, Surface tension, Surfactants, Meteorology.
Identifiers: *Vertical wind tunnels, Drop breakup, Drop shape, Drop size, Terminal velocity.

A vertical wind tunnel was constructed to study the behavior of large, low-surface tension drops in free fall. The tunnel is simple, but provides a low turbulence (0.7%) flow which stably supports large water drops falling at terminal velocity. The influence of reduced surface tension on maximum drop size, drop terminal velocity, and drop shape was investigated. It was found that drops of low surface tension break up at a smaller size than drops with normal surface tension, are more deformed than drops of equal mass having normal surface tension, and have a lower terminal velocity than drops of equal mass and normal surface tension. Drops only partially coated with surfactant cannot be stably supported and undergo violent oscillations. Before any field testing of possible cloud modification by reducing rainwater surface tension is warranted, further investigation of the behavior of low-surface-tension drops should be undertaken and, in particular, the behavior of drops only partially coated with surfactant should be studied. (Sims - ISWS)

DETERMINATION OF THE FREQUENCY OF PRECIPITATION IN EXCESS OF DESIGN CRITERIA AT MORE THAN A SINGLE LOCATION DURING A HYDROLOGIC SEASON,
Missouri Univ., Columbia. Dept. of Atmospheric Science.
W. L. Decker.
Available from the National Technical Information Service Springfield, Va 22161, as PB-252 816, at $6.00 in paper copy $2.25 in microfiche. Completion Report, December 1975. 129 p, 28 fig, 16 tab, 53 ref, 3 append. OWRT A-078-MO (1) 14-31 0001 - 5025

Descriptors: Precipitation(Atmospheric), *Rainfall, *Design criteria, *Precipitation excess, *Illinois, *Distribution patterns, Correlation analysis, Simulated rainfall.
Identifiers: Extreme value rainfall, Storm rainfall.

The exact and asymptotic distributions of the extreme value were considered for estimating the probability of excessive rains. By plotting the cumulative distributions on extreme probability paper and through the use of Kolmogorov-Smirnov test statistics, it was shown that the annual daily maximum rainfall from an area like Central Illinois fits the Fisher-Tippet type I distribution. The aerial decay of correlation coefficients in Central Illinois was studied by the use of 12 years data from 49 stations in the East Central Illinois Network. From these correlation coefficients it was possible to compute the parameter 'm' required in the bivariate extremal distribution. In the bivariate analysis, 'm' measures the degree of association between annual daily maximum rainfall from two locations. Using the computed 'm' values between stations, the joint probability of annual daily maximum rainfall exceeding the design criteria at each of the two locations was computed. Also the computation of conditional probability that one station's rainfall exceeds the design criteria given that the other stations rainfall exceeded its design criteria was also demonstrated. The possibility of applying the method to the joint probability of occurrence for more than two locations (multiple occurrence) was explored.

A STUDY OF MAJOR RAIN STORMS OVER AND NEAR MAHI BASIN UP TO KADANA DAM SITE FOR THE EVALUATION OF PROBABLE MAXIMUM DESIGN STORM,
Institute of Tropical Meteorology, Poona (India).
O. N. Dhar, P. Rakhecha, and R. B. Sangam.
Indian Journal of Power and River Valley Development, Vol. XXV, No. 1, p 29-34, January 1975. 2 fig, 5 tab, 16 ref.

Descriptors: *Rain, *Storms, *River basins, Design storm, Dams, Frequency analysis, Estimating, Probability, Maps, Rain gages, Monthly, Annual, Monsoons.
Identifiers: Mahi basin(India), Isohyetal method.

Mean monthly and annual rainfall of the Mahi basin up to Kadana dam site has been worked out by the isohyetal method on the basis of rainfall data of the period 1901-1950. Highest rain depths actually experienced by the Mahi basin up to Kadana dam site during the period 1902 to 1962 were also worked out for 1-, 2-, and 3-day durations on the basis of maximum rainfall experienced during these durations in each year of the above period. Using frequency analysis, return period of the highest rain depths experienced by the basin for different durations were determined. Maximum basin rain depths for the return periods of 500, 1000 and 10,000 years were also worked out on the basis of 61-year data of basin rainfall for the use of design engineers and hydrologists. Intense rainstorms which occurred in and around the basin during the 61-year period were also picked out and most severe rainstorms were selected for transposition over the basin in order to obtain probable maximum rain depths. The July 1927 rainstorm over north Gujarat was found to be the most severe rainstorm over this region and its transposed rain depths were determined. These were then maximized for moisture charge in order to obtain probable maximum rain depths over the Mahi basin. (Bell-Cornell)

AN APPROXIMATE ANALYSIS OF MELTING AND FREEZING OF A DRILL HOLE THROUGH AN ICE SHELF IN ANTARCTICA,
Syracuse Univ., N.Y. Dept. of Chemical Engineering and Material Sciences.
C. Tien, and Y-C. Yen.
Journal of Glaciology, Vol. 14, No. 72, p 421-432, 1975. 4 fig, 3 ref, 1 append.

Descriptors: *Antarctic, *Cold regions, *Drill holes, *Ice, Freezing, Melting, Thawing, Mathematical studies, Model studies, Mathematical models, Heat transfer, Heat flow, Heating, Glaciology.
Identifiers: *Ice shelves.

An approximate analysis of the processes of melting and freezing of a drill hole, 500 m depth and 0.15 m in initial radius, through an ice shelf was made. Results were expressed in graphical form showing the time available for experimentation under the hole as a function of heating duration. It was also found that refreezing has a much slower rate than melting. (Sims - ISWS)

CLIMATOLOGICAL IMPLICATIONS OF MICROPARTICLE CONCENTRATIONS IN THE ICE CORE FROM 'BYRD' STATION, WESTERN ANTARCTICA,
Ohio State Univ. Research Foundation, Columbus. Inst. of Polar Studies.
L. G. Thompson, W. L. Hamilton, and C. Bull.
Journal of Glaciology, Vol. 14, No. 72, p 433-444, 1975. 7 fig, 1 tab, 26 ref. NSF OPP71-04063-A02.

Descriptors: *Antarctic, *Paleoclimatology, *Ice, Volcanoes, Dusts, Temperature, Climatology, Laboratory tests, Radioactive dating.
Identifiers: *Ice cores, Ice sheets, Microparticles, Particle concentrations.

The concentration of microparticles in the 2164 m long ice core from 'Byrd' station, Antarctica, varies cyclically. Highest concentrations of 0.65 micrometer diameter microparticles occur where oxygen-isotope studies show lowest paleotemperatures. The age of the bottom ice estimated from microparticle-concentration variations, assuming an annual cycle, is 27,000 years, much less than from oxygen-isotope studies. (Sims - ISWS)

TESTS OF THE CONCEPT OF SECONDARY FROST HEAVING,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Dept. of Agronomy.
J. P. G. Loch, and R. D. Miller.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1036-1041, November-December 1975. 5 fig, 1 tab, 20 ref. CRREL DA-ENG-27021-72-G32, NSF GK-42050.

Descriptors: *Frost heaving, *Frozen ground, *Frozen soils, Permafrost, Freezing, Frost, Ice, Soil water, Pore water, Soils, Laboratory tests, Laboratory equipment.
Identifiers: Ice lenses.

Heaving tests were conducted with 2-4, 4-8, and 8-16 micrometer soil fractions in special apparatus in which sliding friction (during heaving) was eliminated by confining the specimen as in standard triaxial test apparatus. Maximum pressures developed by heaving exceeded those computed by a primary heaving model (using air intrusion data) by factors as large as 3 to 6. Maximum pres-

sures and rates of heave at constant pressures depended on temperature gradient and were maximal at gradients between 1 and 3C per cm. Comparisons were simplified transport equations for a frozen fringe adjacent to a growing ice lens (the characteristic feature of secondary heaving) indicated that pore ice in the frozen fringe contributes to water transport for lens growth, but this may be offset by plastic counter-flow of ice at large temperature gradients, accounting for the gradient-dependent maxima. Results were interpreted as supporting the concept of secondary heaving. (Sims - ISWS)

GLACIER SURVEYS IN ALBERTA - 1971,
Canada Centre for Inland Waters, Burlington (Ontario); and Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
I. A. Reid, and J. O. G. Charbonneau.
Water Resources Branch Report Series No. 43, 1975, 18 p., 10 fig., 6 ref., 15 tab.

Descriptors: *Glaciers, *Surveys, Photogrammetry, Mapping, Profiles, Elevation, *Canada.
Identifiers: *Alberta, Water Survey of Canada, Athabasca Glacier, Saskatchewan Glacier, Mathematical computations, Volumetric change.

Glaciers act as natural regulators, storing water in winter and releasing it in summer. To gain some understanding of this phenomenon and the contribution which glaciers make to streamflow, the predecessors of the Water Survey of Canada began glacier surveys in 1945. The earlier surveys offered some clue to the role of the glacier, but the data collected were not sufficient to provide the overall picture. Following adoption of photogrammetric survey techniques, however, the glacier surveys have evolved to the extent that it is now feasible to produce a series of maps from which the linear, areal, directional and volumetric changes can be determined. The surveys have revealed that the glaciers, in general, are becoming smaller in size; hence the regulation effect is diminishing in the area of ablation. (Environment Canada)

SOURCE, TRANSPORTATION AND DEPOSITION OF DEBRIS ON ARAPAHO GLACIER, FRONT RANGE, COLORADO, U.S.A.,
Colorado Univ., Boulder. Dept. of Geological Sciences; and Colorado Univ., Boulder. Inst. of Arctic and Alpine Research.
M. J. Reheis.
Journal of Glaciology, Vol. 14, No. 72, p 407-420, 1975. 6 fig, 2 tab, 32 ref.

Descriptors: *Glaciers, *Glacial sediments, *Glacial drift, *Colorado, *Rocky Mountain region, Gravels, Rocks, Sands, Till, Sediments, Ice, Cirques, Mountains, Movement, Geomorphology, Rock glaciers, Glaciology.
Identifiers: *Arapaho Glacier(Colo), Debris content.

This study was undertaken to determine the sources of debris and methods of transportation and deposition in and on a small cirque glacier. Data were collected on the amount of debris, stone roundness, the presence of striations and polish, and till fabric. Lichenometry gave relative ages of the tills, and suggested that the Gannett Peak till is of at least three ages and probably overlies Audubon till. Debris originating from subglacial erosion can be differentiated from that from rockfall or avalanches on stone roundness, polish and striations. A maximum of 70% of the present glacial load derives from subglacial erosion, as compared to 88% during the Gannett Peak stade. Rockfall rates are 35-50 cu m/year at present and were 290-485 cu m/year during the Gannett Peak stade. Data on present-day processes and on the volume and age of Gannett Peak moraines can be used to make comparisons on present and past rates of denudation. The denudation rate in the cirque at present is 95-165 mm/1000 year; in the past it was 4920-8160 mm/1000 year. The denudation rate and the glacial effects on debris are comparable to rates from other glacial areas and effects on debris carried by valley glaciers and continental ice sheets. (Sims-ISWS)

QUANTITATIVE STEREOLOGICAL ANALYSIS OF GRAIN BONDS IN SNOW,
Eidgenoessische Institut fuer Schnee- und Lawinenforschung, Davos (Switzerland).
P. R. Kry.
Journal of Glaciology, Vol. 14, No. 72, p 467-477, 1975. 6 fig, 1 tab, 12 ref.

Descriptors: *Snow, *Laboratory tests, *Physical properties, Analytical techniques, Particle size, Crystals.
Identifiers: *Grain bonds, *Stereological analysis, Grain-bond size.

A section-plane preparation technique and an operational definition of a snow grain bond were developed to allow quantitative analysis of bonding in snow structure. Values for three-dimensional grain size, grain-bond size and number density, and related bonding measurements were presented for equitemperature metamorphosed snow. These results from mutually orthogonal planes within a given snow block showed that the assumptions of randomness and isotropy of grain and grain-bond location and orientation, necessary for stereological analysis from one plane, are satisfied to within + or - 10% even after 30% uniaxial plastic deformation of the snow block. The idealization of a grain bond as a circular plane disk yielded self-consistent results. The number of bonds per grain cannot be accurately determined from two-dimensional studies due to variations in the shape and size of snow grains within a given sample. (Sims-ISWS)

THE RELATIONSHIP BETWEEN THE VISCO-ELASTIC AND STRUCTURAL PROPERTIES OF FINE-GRAINED SNOW,
Eidgenoessische Institut fuer Schnee- und Lawinenforschung, Davos (Switzerland).
P. R. Kry.
Journal of Glaciology, Vol. 14, No. 72, p 479-500, 1975. 13 fig, 3 tab, 18 ref.

Descriptors: *Snow, *Physical properties, *Laboratory tests, Compaction, Mechanical properties, Compressive strength, Youngs modulus, Structural behavior, Stress, Strain, Strength.
Identifiers: *Grain bonds, Grain-bond size.

New and felt-like snow was sieved and sintered at a constant temperature in order to produce homogeneous samples of fine, rounded-grain snow with a density in the range 270-340 kg/cu m. The structure of single samples was changed in stages by nondestructive uniaxial compression. This deformation, which amounted to 30%, took place within 8 hours (thus limiting temperature metamorphism). At each stage the Young's modulus was measured quasi-statically and the creep behavior under constant uniaxial compression was recorded. Stereological analysis of sections from the samples provided mean values for both grain-bond and grain properties. The Young's modulus increased with density slightly more strongly than linearly, whereas the low-stress viscosity in unconfined compression increased nearly exponentially for densities less than 380 kg/cu m. The maximum densification resulted in a 15-fold increase in the measured viscoelastic properties. However, the number of grain bonds per unit mass increased linearly by a factor in the range 1.5 to 2 while the average grain-bond size remained constant. It was concluded that only a fraction of the grain bonds in a snow sample transmit an applied stress, and that the new grain bonds formed during the deformation of a snow sample determine the visco-elastic properties of snow. ELECTROMAGNETIC REFLECTION FROM MULTI-LAYERED SNOW MODELS,
National Aeronautics and Space Administration, Moffett Field, Calif. Ames Research Center.
W. L. Linlor, and G. R. Jiracek.
Journal of Glaciology, Vol. 14, No. 72, p 501-515, 1975. 12 fig, 2 tab, 16 ref.

Descriptors: *Snow, *Ice, *Measurement, *Remote sensing, Electromagnetic waves, Reflectance, Model studies, Mathematical models, Melt water, Snowpacks, Snow cover, Water resources, Electrical properties, Instrumentation.
Identifiers: *Dielectric properties.

The remote sensing of snow-pack characteristics with surface installations or an airborne system could have important applications in water-resource management and flood prediction. To derive some insight into such applications, the electro-magnetic response of multi-layered snow models was analyzed. Normally incident plane waves at frequencies ranging from 1 to 10,000 MHz are assumed, and amplitude reflection coefficients are calculated for models having various snow-layer combinations, including ice layers. Layers are defined by a thickness, permittivity, and conductivity; the electrical parameters are constant or prescribed functions of frequency. To illustrate the effect of various layering combinations, results were given in the form of curves of amplitude reflection coefficients versus frequency for a variety of models. Under simplifying assumptions, the snow thickness and effective dielectric constant can be estimated from the variations of reflection coefficient as a function of frequency. (Sims - ISWS)

LOW-TEMPERATURE HEAT CONDUCTION IN PURE, MONOCRYSTALLINE ICE,
Universite Scientifique et Medicale de Grenoble (France). Laboratoire de Spectrometrie Physique.
J. Klinger.
Journal of Glaciology, Vol. 14, No. 72, p 517-528, 1975. 6 fig, 23 ref.

Descriptors: *Ice, *Thermal conductivity, *Heat transfer, Crystals, Crystal growth, Growth rates, Laboratory tests, Thermal properties, Physics, Physical properties, Conductivity, Measurement, Glaciology.

The heat conduction of ice single crystals was measured by a steady-state heat-flux method between 1.7 K and 100 K. For temperatures higher than 16 K all experimental points were found to be on the same curve. For temperatures lower than 16 K the heat conduction curves depended on the material of the crystallization vessel, the aging of the sample and the cooling rate between the temperature of the mount (about 260 K) and liquid-nitrogen temperature. No anisotropy could be found for temperatures higher than 9 K. Computer fits were made, based on Callaway's model of heat conduction in dielectric crystals. An attempt was made to explain the observed extrinsic heat conduction by the presence of microstructures in ice. It was shown that heat-conduction measurement can be used to establish a 'quality-list' of samples studied in laboratories. (Sims - ISWS)

ISUA, GREENLAND: GLACIER FREEZING STUDY,
Cold Regions Research and Engineering Lab., Hanover. N.H.
G. D. Ashton.
Available from the National Technical Information Service, Springfield, Va., 22161 as ADA-009 705 $4.00 in paper copy, $2.25 in microfiche. Research Report 334, April 1975. 19 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Freezing, *Glaciers, Movement, *Cooling, Mining, Mining engineering, Drill holes, Shafts(Excavations), Cold regions, Ice, Ice cover, Coolants, Heat transfer, Physical properties.
Identifiers: *Greenland, *Isua(Greenland).

A scheme for cooling the lower portion of the edge of the Greenland ice sheet, which abuts a potential mining operation, was examined. The magnitude of cooling which may be accomplished by drilling a series of holes about the periphery of the mine site was determined as a function of hole size, spacing and time. Refrigeration was accomplished by pumping a coolant downhole in a central pipe, then uphole in an annulus between the pipe and hole wall, and then through a thin-walled pipe exposed to the surface climate above the ice sheet. It was found possible to achieve a temperature change in the ice of the order of -1 C with hole spacings and pumping requirements which are considered reasonable. Other effects were briefly examined and included an estimate of the basal water thickness and flow rates. (Sims - ISWS)

MODEL INVESTIGATIONS OF ICE ENTRAINMENT BENEATH EDGE OF AN COVER ICE.
A. M. Filippov.
Available from the National Technical Information Service, Springfield, Va., 22161, as ADA-009 694 $3.50 in paper copy, $2.25 in microfiche. CRREL Draft Translation 475, May 1975. 8 p, 3 fig, 4 ref. Translated from Trudy Gosudarstvennogo Instituta, No. 201, p 107-114, 1973.

Descriptors: *Model studies, *Ice cover, *Rivers, Movement, Ice jams, Ice-water interfaces, Slush, Drifting(Aquatic), Currents(Water), Ice.

Model investigations of the drawing in of slush and ice under the edge of an ice sheet are a component part of the study of ice-dam and ice-jam formation processes in rivers, as well as a stage in the experimental development of methods for the hydraulic regulation of slush and ice movements. By using this type of research, it is possible to determine the conditions governing the drifting of ice blocks of various lengths, widths and thicknesses under an ice sheet for flows having different hydraulic parameters. VARIATION IN EVAPORATIVE POWER ON SLOPES OF DIFFERENT EXPOSURE AND STEEPNESS IN THE USSR,
Ye. N. Romanova.
Soviet Hydrology, Selected Papers, No. 5, p 334-343, 1974. 2 fig, 7 tab, 7 ref. Translated from Transactions of the Main Geophysical Observatory (Trudy GGO), No. 339, p 35-47, 1974.

Descriptors: *Evaporation, *Slopes, *Mountains, *Climates, Physical properties, Solar radiation, Latent heat, Water loss, Climatology, Meteorology.
Identifiers: *USSR.

Study of the characteristics of evaporative power on different slopes is important for the theory of the microclimate and for solving some applied problems in meteorology, agroclimatology, etc. Of all the existing methods for determining evaporative power, the method where evaporative power is determined from the ratio of the net radiation of a wetted surface to the latent heat of vaporization, is most suitable for determining evaporative power on slopes, since it is free of errors in the computation of evaporative power by the other methods in a rugged relief. This is the method used here to compute evaporative power on slopes. Evaporative power was computed for the four major exposures (north, south, east, and west) of slopes with a steepness of 5, 10, 15, and 20 degrees. A gradual increase in evaporative power with increasing slope steepness and from zone to zone was observed on northern and southern slopes. On 5 deg northern slopes, evaporative power decreased by comparison with level areas by 3.5 cm in the excessively wet zone and by 6.5 cm in the arid zone, whereas on the same slopes of 20 deg it was decreased by 15.0 and 28.1 cm, respectively. A similar pattern was observed on southern slopes, but evaporative power on these slopes differed less from that on a level area than on northern slopes: it increased by 17.6 cm on a 20 deg southern slope. (Sims-ISWS)

PROBABILITY STUDIES OF AGRICULTURAL WATER MANAGEMENT IN HARYANA STATE,
Haryana Agricultural Univ., Hissar (India).
O. P. Bishnoi.
Indian Journal of Meteorology, Hydroiogy and Geophysics, Vol. 26, No. 1, p 101-104, January 1975. 5 fig, 1 tab, 4 ref.

Descriptors: *Irrigation, *Farm management, *Rainfall, *Evaporation, Precipitation(Atmospheric), Evapotranspiration, Water supply, Planting management, Dry farming, Soil moisture, Drainage, Climatology.
Identifiers: *India.

The probability of water surplus and deficiencies have been utilized in viewing the problems of agricultural water management. For maximization of the yield, the supply system must be based on the amount of water deficits and their durations. At Ambala, maximum water storage capacity is attained only once in 11 years for 150 days duration from July. The Kharif crop of 90 days duration can successfully be taken once in 2 years, the crops of 120 days duration can succeed in 2 out of 5 years, whereas the crops of still longer duration, i.e., 150 days can grow well only once in 3 years without moisture stress. An adequate amount of water is required even during the rainy season at Hissar. During the monsoon months, the drainage capacity of 7 mm/day is desired once in 2 years. The climatic conditions are suitable during July 12 to September 14 and December 15 to February 17 at Ambala once in 2 years for storing the water in anticipation of the demand. (Sims-ISWS)
W76-07770

CLIMATOGICAL ESTIMATES OF EVAPOTRANSPIRATION,
Department of the Environment, Ottawa (Ontario). Hydrology Research Div.
F. I. Morton.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY3, Proceedings Paper 11974, p 275-291, March 1976. 5 fig, 1 tab, 15 ref, 2 append.

Descriptors: *Climatology, *Evapotranspiration, *Evaporation, Hydraulics, Hydrology, Rainfall, Rivers, Runoff, Model studies, Hydrologic budget, Evaporation pans, Deserts, Irrigated land.
Identifiers: *Climatological observations, Potential evaporation.

Interactions between evaporating surfaces and the overpassing air suggested that potential evaporation responds in a complementary way to changes in the availability of water for evapotranspiration from the surrounding area. Supporting evidence was found in an analysis of dish and pan evaporation data from irrigated areas and adjoining deserts. The concept was used as the basis for a model which provides estimates of evapotranspiration from routine climatological observations without the need for assumptions concerning the soil-vegetation system and its effects on the availability of water. The model was calibrated at climatological stations in desert areas, where the monthly precipitation approximates evapotranspiration, and applied without local optimization of coefficients over a wide range of environments. The versatility of this unorthodox concept was demonstrated by comparing model and water budget estimates of evapotranspiration for 120 river basins in Canada, Ireland, Kenya, and the southern United States. ESTIMATION OF EVAPOTRANSPIRATION FOR WATER BALANCE STUDIES IN A SEMI-ARID REGION,
Indian Agricultural Research Inst., New Delhi. Div. of Agricultural Physics.
P.S.N. Sastry, and N.V.K. Chakravarty.
Indian Journal of Power and River Valley Development, Vol. XXV, No. 9, p 288-290, September 1975. 1 fig, 2 tab, 10 ref.

Descriptors: *Evapotranspiration, *Water balance, Semiarid climates, Estimating, Irrigation, Scheduling, Monsoons, Evaporimeters, Meteorology.

Derivation of water balance in a region for purposes of irrigation scheduling on an operational basis requires measurement or estimation of potential evapotranspiration (PET). With a view to assess the applicability of the different formulae currently in use, PET obtained during the south west monsoon season over 10-day periods for

three years were estimated using the formulae developed by (a) Penman, (b) Blaney-Criddle and (c) Papadakis. These have been related to the measured values of evaporation from the standard class A-mesh covered pan evaporimeter. It was observed that estimates of PET made by Penman and Blaney-Criddle methods are fairly comparable with the pan evaporation values when they lie between 4 to 5 mm/day which is also incidentally the average pan evaporation value for the Delhi region during the monsoon season. At other values, there is wide disagreement. Estimation of daily PET using Penman's method during the monsoon season in semi-arid environments like the Delhi region is not recommended for computing daily water balance. (Bell-Cornell)

ESTIMATING WATER TEMPERATURES AND TIME OF ICE FORMATION ON THE SAINT LAWRENCE RIVER,
National Oceanic and Atmospheric Administration, Detroit, Mich. Great Lakes Environmental Research Lab.
C. E. Adams, Jr.
Limnology and Oceanography, Vol. 21, No. 1, p 128-137, January 1976. 4 fig, 5 tab, 18 ref.

Descriptors: *St. Lawrence River, *St. Lawrence Seaway, *Freezing, *Water temperature, Forecasting, Heat flow, Heat transfer, Heat balance, Cooling, Ice, Evaporation, Rivers, Navigation, Mathematical models.

Monthly mean heat losses from the surface of the St. Lawrence River during the fall-winter cooling period were determined by an empirical heat budget which incorporated the processes of radiation, conduction, convection, and precipitation. Calculations indicated that the heat loss can be reasonably represented by a simple linear relation with air-water temperature differential. It was suggested however, that the coefficient of proportionality changes with variations in the ratio of radiation to evaporation. An equation was evaluated which relates surface heat loss to temperature decline along the international section of the river. Within the limits of accuracy of the heat loss calculations, the equation provided adequate estimates of water temperature changes for the period of study. The water temperature decline equation was used as the basis for developing a prediction technique which enables river freeze-up estimates to be made as early as 1 October. When observed freeze-up dates were used, predictions for a 6-year period (1965-1970) yielded standard deviations of 4.7, 3.3, and 3.5 days for predictions starting at the beginning of October, November, and December. Observed freeze-up occurred within 2 days of the predicted date in 4 of the 6 years examined. Experimental predictions for two additional years yielded similar results. (Sims-ISWS).

ANNUAL PEAK DISCHARGES FROM SMALL DRAINAGE AREAS IN MONTANA THROUGH SEPTEMBER 1975,
Geological Survey, Helena, Mont.
M. V. Johnson, R. J. Omang, and J. A. Hull.
Open-file report, 1976. 204 p, 2 fig.

Descriptors: *Peak discharge, *Small watersheds, *Montana, *Basic data collections, Streamflow, Hydrologic data, Floods, Discharge(Water).

A program to investigate the magnitude and frequency of floods from small drainage areas in Montana was begun July 1, 1955. This, the twenty-first annual report, is primarily a tabulation, by water year, of the annual peak stage and discharge at each crest-stage gaging station. Also, it summarizes the activities and progress made during the 1975 water year. During the 1975 water year 212 gages were operated, 178 east of the Continental Divide and 34 west of the Divide. Substantial peak flows occurred during the water year; however, runoff patterns varied greatly. Along the west side of the Continental Divide high flows in May or June were caused by combined snowmelt and rain. Peak flows in high mountain areas east of the Divide were caused mainly by snowmelt, but in part by rain. In the prairie area peak flows were mostly caused by isolated rainstorms during summer and spring. Peak flow of record was equalled or exceeded at 56 sites. (Woodard-USGS)

2F. Groundwater

A SIMPLIFIED APPROACH FOR THE ANALYSIS OF UNSTEADY FLOW TO A CAVITY WELL,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soil and Water Engineering.
R. S. Kanwar, S. D. Khepar, H. S. Chauhan, and G. Das.
Ground Water, Vol. 14, No. 2, p 101-105, March-April 1976. 3 fig, 1 tab, 9 ref.

Descriptors: *Groundwater, *Model studies, *Wells, *Aquifer characteristics, Aquifers, Hydraulic conductivity, Storage coefficient, Unsteady flow, Drawdown, Hydraulics.
Identifiers: *Cavity wells.

An analytical solution obtained for unsteady flow to a cavity well has been simplified for finding the aquifer characteristics. In the analysis presented, the relationships become fairly simple for the close approximation of the unsteady state solution. The simplified solution is of great importance for finding the values of storage coefficient and hydraulic conductivity. This solution has large important economic implications, since the formation constants of the aquifer can be found without drilling in the aquifer and installing the screens. If the values of S and K found from these relations are fairly satisfactory after a pumping test, the other more expensive methods which require a fully penetrating well may not be needed. Report ORNL-4927, February 1976. 236 p, 11 fig, 1 tab, 29 ref, 5 append.

Descriptors: *Unsteady flow, *Saturated flow, *Unsaturated flow, *Finite element analysis, *Computer programs, Computer models, Groundwater movement, Porous media, Equations, Infiltration, Seepage, Boundaries(Surfaces), Model studies.
Identifiers: *Galerkin technique, *FORTRAN.

A two-dimensional transient model for flow through saturated-unsaturated porous media has been developed. This model numerically solves the governing partial differential equations, which are highly nonlinear. The model code uses quadrilateral finite elements for the geometrical assembly, bilinear Galerkin interpolation for the spatial integration, and Gaussian elimination for the solution of the resulting matrix equations. In addition to the usual constant-flux and constant-head boundary conditions, the code is capable of applying pressure-dependent boundary conditions at the ground surface. Thus, infiltration into or seepage

from this surface may be simulated. Each element may be assigned different material properties that allow the investigation of layered geologic formations. The report was intended for use as a complete user's manual and contains a listing of the computer code (in FORTRAN) along with both input and output data for two example problems. The results of a computer simulation compared favorably with experimental data obtained from an inclined soil slab at Coweeta Hydrologic Laboratory in North Carolina. The Galerkin finite-element method was found to be superior to the finite-difference method used by previous investigators. By exploiting the flexibility of the finite-element geometrical discretization, the user may easily reduce computer running time by a factor of two. (Visocky-ISWS)

DIGITAL MODEL OF THE GRAVEL AQUIFER, WALLA WALLA RIVER BASIN, WASHINGTON AND OREGON,
Geological Survey, Tacoma, Wash.
R. A. Barker, and R. D. Mac Nish.
Washington Department of Ecology, Olympia, Water-Supply Bulletin 45, 1976. 49 p, 18 fig, 1 plate, 2 tab, 24 ref.

Descriptors: *Groundwater recharge, *Computer models, *Groundwater basins, *Irrigation effects, *Water level fluctuations, Aquifer characteristics, Washington, Oregon, Drawdown, Surface-groundwater relationships, Groundwater movement, Gravels.
Identifiers: *Walla Walla River basin(Wash-Oreg), *Gravel aquifers.

A digital model using a finite-difference technique simulates hydrologic characteristics of a gravel aquifer which underlies about 120,000 acres of the Walla Walla River basin's interior low-land in Washington and Oregon. The gravel aquifer is underlain by a basalt aquifer system and is coupled to an extensive surface network of streams, canals, and springs. The model permits testing of various water-management alternatives involving the spatial and temporal distribution of well pumpage, irrigation application, and surface-water diversion. Trial-and-error simulation of hydrologic phenomena characteristic of the aquifer during typical, recent years (and believed to be applicable for 5-10 years in the future) was used to calibrate the model. Time-dependent fluxes were programmed for each month of the model year on the basis of recently observed local irrigation practices and pumping withdrawals, average crop requirements, and long-term precipitation. The calibrated aquifer hydraulic conductivities range from slightly less than .000155 to .00250 foot per second. Storage coefficients range from 0.1 to 0.25. After beginning the simulation with water levels contoured for January and continuing for 1 year, the calibrated model computed levels to within 10 feet of those originally contoured over about 95 percent of the modeled area--the match was within 5 feet over about 50 percent of the area. AQUIFER TESTS IN THE SUMMIT REACH OF THE PROPOSED CROSS-FLORIDA BARGE CANAL NEAR OCALA, FLORIDA,
Geological Survey, Tallahassee, Fla.
C. H. Tibbals.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-021 586, $4.00 printed copy; $2.25 microfiche. Water-Resources Investigations 28-75, August 1975. 42 p, 18 fig, 5 tab, 6 ref.

Descriptors: *Aquifer testing, *Aquifer characteristics, *Canal seepage, *Water pollution, *Florida, Groundwater, Water table aquifers, Canal construction, Boundaries(Surfaces), Hydraulic conductivity, Saline water intrusion, Anisotropy, Heterogeneity, Groundwater recharge.
Identifiers: *Cross-Florida barge canal, *Floridan aquifer, *Marion County(Fla).

The Summit Pool reach of the proposed Cross-Florida Barge Canal will be excavated into the Floridan aquifer at least 12 feet below the water table. Particular areas of concern are 'outflow' areas where water is expected to pass from the canal into the aquifer. Methods are described that deal with unique boundary conditions and aquifer anisotropy at two sites. Extreme aquifer heterogeneity precluded the determination of aquifer coefficients at one of the sites and probably affected the results of the tests at the other two. Therefore, the calculated aquifer coefficients reported should be regarded only as estimates. Calculated coefficients of horizontal hydraulic conductivity ranged from 0.025 to 3,500 gallons per day per square foot and calculated coefficients of vertical hydraulic conductivity ranged from 0.05 to 23,000 gallons per day per square foot. Ratio of horizontal to vertical hydraulic conductivity ranged from 0.09 to 2.9. (Woodard-USGS)

GEOHYDROLOGY OF THE LAKE AREA AT KATHRYN ABBEY HANNA PARK, JACKSONVILLE, FLORIDA,
Geological Survey, Tallahassee, Fla.
G. W. Leve, and M. I. Backer.
Administrative Report, 1976. 27 p, 6 fig, 4 tab.

Descriptors: *Lakes, *Hydrogeology, *Water quality, *Aquifers, *Florida, Parks, Groundwater movement, Inflow, Shallow water, Surface waters, Chemical analysis, Water analysis, Hydrology.
Identifiers: Kathryn Abbey Hanna Park(Fla).

Kathryn Abbey Hanna Park, Fla., is underlain by a shallow aquifer and the Floridan aquifer. The shallow aquifer is composed of two water-yielding zones: the surficial sand and shell beds and the lower sand and shell beds. The water in the Floridan aquifer is lower in mineral concentration than water in the shallow aquifer. The chloride concentration in the Floridan aquifer is about 20 mg/litre and the dissolved-solids concentration is less than 500 mg/litre. Nine shallow lakes investigated in the park intersect the shallow aquifer. They are recharged directly by rainfall and probably by some inflow from the upper part of the shallow aquifer. The southernmost lake periodically receives inflow of saline water from the Intracoastal Waterway through a canal, and the water is more highly mineralized than in the other lakes. Construction of a control structure on the canal would prevent further inflow of water from the waterway and possibly prevent further fish kills in the lake. Two lakes are densely covered with duckweed, and the dissolved-oxygen concentration of the water ranges from 0.6 to 1.3 mg/litre during daytime hours. The quality of water probably can be improved by increasing the circulation of water in these lakes and by artificially recharging the lakes with water from the Floridan aquifer. (Woodard-USGS)

SPRINGS OF PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
H. N. Flippo, Jr.
Pennsylvania Department of Environmental Resources Harrisburg, Water Resources Bulletin No 10, December 1974. 46 p, 2 fig, 3 tab, 19 ref.

Descriptors: *Springs, *Discharge(Water), *Water quality, *Pennsylvania, Aquifers, Water analysis, *Chemical analysis, Data collections, Water pollution sources, Hydrogeology, Water utilization, Water supply, Evaluation.

Discharge and water-quality data, together with other information, are tabulated for 196 selected springs in Pennsylvania. These springs represent discharges of several principal aquifers; however, about half of them flow from Cambrian and Ordovician limestones and dolomites, which give rise to about 90 percent of all springs having discharges in excess of 100 gpm. The large springs are utilized for fish hatcheries, municipal supplies, and other purposes, because of their relatively good quality characteristics. Eleven of the carbonate-aquifer springs discharge 5,000 to 20,000 gpm. The largest spring, on the basis of median discharge, is Nippono (Enchanted) Spring in Lycoming County, which yields about 18,000 gpm. Some large springs are the discharge points of natural underground conduits that are principally fed by streams. The discharge and quality of water from these springs are variable. The quality of some springs has deteriorated in recent decades. High concentrations of sodium, potassium, chloride, nitrate, and fecal-coliform bacteria in recently sampled spring waters indicate contamination and, in some localities, pollution of the major aquifers. (Woodard-USGS)
W76-07604

THE EXTENDED BOUSSINESQ PROBLEM,
Southern Methodist Univ., Dallas, Tex. Inst. of Tech.
M. A. Collins.
Water Resources Research, Vol. 12, No. 1, p 54-56, February 1976. 5 fig, 1 ref.

Descriptors: *Water table, *Drains, *Groundwater movement, Leakage, Groundwater recharge, Saline water-freshwater interfaces, Aquifers, Groundwater, Continuity equation, Dupuit-Forchheimer theory, Boundary processes, Potentiometric level, Equations, Islands, Depth.
Identifiers: *Boussinesq equation, *Groundwater mound, *Parallel drains, *Saline aquifers, Freshwater lenses, Semipervious layers.

The original Boussinesq problem of the decline of a groundwater mound between parallel drains was extended to include vertical leakage and recharge and cases of freshwater lenses in confined and unconfined saline aquifers. The solution of appropriate continuity equations with some imposed restrictions by variable separation resulted in three distinct flow depth configurations, which could be described analytically. Transient behavior in two of these cases is nonlinear but amenable to exact solution and can be delineated in a (2 mu + beta, sigma + mu) plane, where beta and sigma are leakage and recharge parameters and mu is a separation constant. It was found that similarity solutions, one of which is the originial Boussinesq solution, exist for both decreasing and increasing flow depths. Active and passive influences of boundary conditions were distinguished. Solutions were applied to the evaluation of saline water intrusion in some coastal zones of Long Island, New York. KARST AND PALEOHYDROLOGY OF CARBONATE ROCK TERRANES IN SEMIARID AND ARID REGIONS WITH A COMPARISON TO HUMID KARST OF ALABAMA,
Geological Survey, Reston, Va.
V. T. Stringfield, P. E. LaMoreaux, and H. E. LeGrand.

Alabama Geological Survey, University, Bulletin 105, 1974. 106 p, 28 fig, 92 ref.

Descriptors: *Karst hydrology, *Arid climates, *Humid climates, *Paleohydrology, Hydrologic aspects, Carbonate rocks, Karst, Environmental effects, Climatic data, Meteorological data, Foreign countries, Australia, Mexico, Africa, *Alabama, Arizona, Reviews, Sinks, Caves.
Identifiers: *Climate effects on Karst.

The contrast in precipitation between humid and arid carbonate regions is reflected in the relative degrees to which karstification is now active in these types of regions. This report describes three carbonate-rock terranes in arid or semiarid regions (Kaibab plaueau in Arizona, Nullarbor Plain on the south coast of Australia, and the Western Desert of Egypt) and compares them with terranes in more humid regions of the United States and with that in the northern part of the Yucatan Peninsula, Mexico. Carbonate-rock areas in Alabama, U.S.A., are described as representative of those in humid climates. Reconstruction of the geologic and hydrologic history of each arid carbonate region reveals that karstification has been preserved from earlier times when the climate was less arid. (Woodard-USGS)

SUMMARY APPRAISALS OF THE NATION'S GROUND-WATER RESOURCES--TEXAS-GULF REGION,
Geological Survey, Austin, Tex.
E. T. Baker, Jr., and J. R. Wall.
Available from Superintendent of Documents, Government Printing Office, Washington, D. C., 20402, $2.45 in paper copy. Professional Paper 813-F, 1976. 29 p, 5 fig, 3 plates, 4 tab, 100 ref.

Descriptors: *Groundwater resources, *Available water, *Water quality, *Regional analysis, *Hydrologic data, Water supply, Water yield, Water storage, Aquifer characteristics, Water utilization, Water demand, Conjunctive use, Water resources development, Water rights.
Identifiers: *Texas-Gulf Region.

Groundwater in the Texas-Gulf Region is a large and important resource that can provide a more significant percentage of the total water supply of the region. Total water requirements within the region are projected to rise sharply from 14 million acre-ft (17 cubic kilometres) in 1970 to nearly 26 million acre-ft (32 cubic kilometres) in 2020. About half of the water used in 1970 was groundwater. An estimated total of 1.04 billion acre-ft (1,280 cubic kilometres) of recoverable water containing less than 3,000 mg/litre dissolved solids is stored above a depth of 400 ft (122 metres) in the aquifers of the region. In addition, part of an estimated 3.28 billion acre-ft (4,040 cubic kilometres) of water in storage below 400 ft (122 metres) is recoverable. Although not all of the groundwater in storage is recoverable, a significant amount is available for development; and an enormous quantity is accessible should occasions prompt its use on a time-limited basis. GEOHYDROLOGIC SIGNIFICANE OF LITHOFACIES OF THE CARRIZO SAND OF ARKANSAS, LOUISIANA, AND TEXAS AND THE MERIDIAN SAND OF MISSISSIPPI,
Geological Survey, Baton Rouge, La.
J. N. Payne.
Available from Supt. of Documents, GPO Wash., D.C. 20402, price $11.00. Geological Survey Professional Paper 569-D, 1975. 11 p, 2 fig, 9 plates, 1 tab, 60 ref.

Descriptors: *Hydrogeology, *Water quality, Lands, *Lithification, *Hydrologic data, Chemical analysis, Groundwater, Water wells, Arkansas, Louisiana, Texas, Mississippi, Maps, Aquifer characteristics, *Sands.
Identifiers: *Lithofacies, Carrizo Sand, Meridian Sand.

The study of the Carrizo and Meridian Sands is the fourth part of an investigation of the geohydrology of the Claiborne Group. The regional dip of the Carrizo and Meridian Sands is into the Desha basin, Mississippi embayment, and gulf coast geosyncline. Some movement of major structural features took place during Carrizo and Meridian time. Normal faulting is rather extensive in southern Arkansas and in Texas. The thickness of the Carrizo and Meridian Sands varies from 0 in areas of nondeposition to a maximum of 700-750 feet in De Witt and Karnes Counties, Tex. Aquifer tests indicate that the coefficient of permeability increases with increase in sand-unit thickness, but the range in values in the Carrizo and Meridian Sands is not as great as the range in values found in the other Claiborne aquifer formations. The areas of highest transmissivity of the formations are in west-central Mississippi and in southern Texas. In Mississipi and Texas the dominant anion is bicarbonate in water from the Carrizo and Meridian Sands from depths of 1,700 to more than 2,500 feet. In Arkansas and Louisiana, chloride is the dominant anion below depths of 500-1,00 feet. (Woodard-USGS)

COMPARISON OF LABORATORY AND FIELD DETERMINED SATURATED HYDRAULIC CONDUCTIVITY AND PREDICTION FROM SOIL PARTICLE SIZE,
University of the West Indies, St. Augustine (Trinidad). Dept. of Soil Science.
F. A. Gumbs.
Trop Agric. 51(3), p 375-382, 1974.

Descriptors: Analytical techniques, *Instrumentation, *Water table, *Hydraulic conductivity, *Measurement, Soil types, Particle size, Sands, Silts, Clays, *Regression analysis.

A very simple apparatus is described for measuring saturated hydraulic conductivity (SHC) above a water table in the field. The horizontal component of SHC measured by laboratory and field techniques was studied at the 0-30 cm, 30-60 cm, 60-120 cm and 120-180 cm depths at 2 sites about 150 m apart on River Estate sandy loam. The mean laboratory measured values were usually greater (by a factor of 1.5-15) than the field values and replicates were more variable. The soil profiles at the 2 sites differed in appearance and in particle size distribution and this latter influenced the SHC. SHC was significantly positively correlated with the coarse sand content and regression equations involving coarse sand content were good at predicting the SHC as measured in the field. The multiple regression equation of SHC with the four particle sizes (coarse sand, fine sand, silt and clay) had the highest variable proportion for regression but the F ratio was significant only at $P = 0.05$. The simple linear regression (SHC = 0.62 + 0.11% coarse sand) should be adequate for soil survey work and for calculating drain spacing. In this soil type SHC increased markedly as the bulk density decreased from 1.4 g/cm3 (porosity of 48%). A bulk density of 1.4 g/cm3 may be critical for adequate water relations in this soil type.--Copyright 1974, Biological Abstracts, Inc.

THE WILTING POINT AND AVAILABLE MOISTURE IN TROPICAL FOREST SOILS OF NIGERIA,
Ife Univ. (Nigeria). Dept. of Soil Sciences.
A. O. Obi.
Exp Agric. 10(4), p 305-312, 1974.

Descriptors: *Soil moisture, Moisture content, Africa, *Wilting point, *Forest soils, Tropical regions, *Soil water, Crops, Greenhouses.
Identifiers: *Nigeria, Okra, Sunflower.

Availability of soil water was investigated and the methods of determining the lower limit of availability by biotic and standard 15-bar pressure were compared. Greenhouse-grown sunflower and okra were the test crops for the biotic method. The pressure membrane equipment was used for standard 15-bar moisture determination. Okra and sunflower took up water beyond the standard 15-bar tension, thus lowering the moisture content at moderate wilting below the generally accepted values. In topsoil okra wilted at very high tensions, but at somewhat lower tensions in subsoil samples, unlike sunflower which wilted at higher tensions in subsoil samples. An equation is given

which may be used to estimate the moisture content at the moderate wilting point of plants with known wilting tensions.--Copyright 1975, Biological Abstracts, Inc.

DETERMINATION OF SOIL-WATER DIFFUSIVITY FOR ANISOTROPIC STRATIFIED SOILS,
Connecticut Agricultural Experiment Station, New Haven.
B. L. Sawhney, J.-Y. Parlange, and N. C. Turner.
Soil Science Society of America Journal, Vol. 40, No. 1, p 7-9, January-February 1976. 3 fig, 10 ref.

Descriptors: *Soil moisture, *Diffusion, *Soil water movement, Soil physical properties, Soil properties, Soil water, Unsaturated flow, Subsurface water, *Anisotropy, Laboratory tests, Infiltration.
Identifiers: *Stratified soils.

The unsaturated soil-water diffusivity of an anisotropic soil can be described by a second-order tensor. In the particular case of a stratified soil, the diffusivity tensor is defined by the two values of the diffusivity in the principal directions, one normal and one parallel to the soil layer. The standard method of Bruce and Klute then requires the use of two soil columns, one for each direction, to define the diffusivity tensor. The present method made use of a two-dimensional similarity solution first derived for an isotropic medium and extended here to a stratified soil. It was then possible to obtain the diffusivity tensor of the stratified soil from one experiment only. As an illustration of the method, the diffusivity tensor of a mica layer was measured and the result was used to analyze infiltration from a finite trench. (Sims-ISWS)

COMPARISONS OF CALCULATED AND MEASURED CAPILLARY POTENTIALS FROM LINE SOURCES,
Southern Piedmont Conservation Research Center, Watkinsville, Ga.
A. W. Thomas, H. R. Duke, D. W. Zachmann, and E. G. Kruse.
Soil Science Society of America Journal, Vol. 40, No. 1, p 10-14, January-February 1976. 4 fig, 2 tab, 11 ref.

Descriptors: *Soil physical properties, *Capillary action, *Soil water movement, *Irrigation, Capillary water, Soil moisture, Soil water, Infiltration, Hydraulic conductivity, Subsurface irrigation, Subsurface flow, Laboratory tests.

Calculated distributions of capillary potentials were compared with those measured in a soil bin designed to model the water distribution from a subsurface irrigation system. Capillary potentials were computed from mathematical equations developed to model steady infiltration from a distribution of line sources which lie in a horizontal plane and are parallel and equally spaced. Capillary potentials were measured from a steady flow regime created in a soil bin for two soils. This study has shown promise that the equations can predict the capillary potentials in most regions of a soil mass which is irrigated with a subsurface system. (Sims-ISWS)

ASSESSMENT OF SOIL MOISTURE STORAGE FROM RAINFALL AND ITS UTILITY IN RABI CROP PLANNING IN HARYANA STATE,
Haryana Agricultural Univ., Hissar (India).
O. P. Bishnoi.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 26, No. 1, p 97-100, January 1975. 4 fig, 5 tab, 6 ref.

Descriptors: *Rainfall, *Soil moisture, *Crops, *Dry farming, Moisture availability, Evaporation, Precipitation(Atmospheric), Climatology, Soil water, Soil-water-plant relationships, Farm management, Planting management.
Identifiers: *India.

An assessment of the accumulated soil moisture has been made during the subnormal, normal and above normal years of rainfall over Haryana State. It was found that the accumulated soil moisture of 20 to 170 mm during the sub-normal years, 50 to 300 mm during the normal years, 100 to 500 mm during the above normal years exist from southwestern zone to the northern region of the state. The Rabi crop planning strategy has been formulated for optimization of the yield with the given quantity of water available due to the existing rainfall patterns. (Sims-ISWS)

AN IRRIGATION RATING FOR SOME SOILS IN ANTIGUA, W. I.,
Macdonald Coll., Montreal (Quebec).
R. W. Borden, and B. P. Warkentin.
Trop Agric. 51(4), p 501-513, 1974.

Descriptors: *Soils, *Irrigation efficiency, Physical properties, Soil profiles.
Identifiers: Antigua, West-Indies.

Criteria for establishing the irrigation suitability of soils in Antigua, West Indies, were developed by reevaluating criteria developed for temperate climates to take into consideration the soil physical property differences that result from a tropical environment and the specific local conditions. These are essentially the role of texture, structure and drainage, and also the effect of cracking in clays on structure and drainage. Seven potential irrigation sites were investigated and rated, according to the criteria established, on the basis of texture, structure, depth and uniformity of the profile, salinity, alkalinity and drainage. One site was rated as class 1 land, 2 sites were predominantly class 2 land, 1 site was class 3 and 3 sites were dominantly class 4, though these exhibited a high amount of variability. During the detailed investigation of the sites, a number of soil phases and 1 new soil series were added to the catalog of soils on Antigua.--Copyright 1975, Biological Abstracts, Inc.

THE PHYSICO-CHEMICAL CHANGES OF NEWLY FLOODED SOILS,
Andhra Pradesh Univ., Hyderabad (India). Agricultural Research Inst.
R. M. Badrinarayan, and J. Venkateswarlu.
J Indian Soc Soil Sci. 22(1), p 13-18, 1974.

Descriptors: Soils, *Flooding, *Rice, Manganese, Phosphorus, *Soil chemistry, Iron, Silica, Aluminum.

Changes occurring when soils were brought under low-land paddy for the 1st time were studied. A period of submergence of 2-3 wk appeared to be necessary for obtaining better dry matter production for rice grown under lowland conditions for the 1st time. Green manuring with 2-3wk of submergence further enhanced dry matter production. Submergence of the soils for the 1st time led to an Al concentration of 1.2 to 1.64 ppm which, if not removed through drainage, might be toxic to rice. Si in the leachate was sufficient under submergence for normal growth. The adsorbed Fe, Mg and P generally increased with the period of submergence while K decreased after 3 wk of submergence.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Great Lakes, *Lake Erie, *Waves(Water), *Wind velocity, Shores, *Shore protection, Model studies.
Identifiers: *Design wave.

Hindcast wave information that is applicable to many planning and design purposes on Lake Erie is presented. Historical wind data from four stations along Lake Erie served as input to the numerical hindcast model, and significant wave heights were calculated for 5-, 10-, 20-, 50-, and 100-yr return periods. These results are provided in tabular form for 24 points along the Lake Erie shoreline. The mean significant period for each of these wave heights is also given. Information is provided for four seasons of the year (January-March, April-June, July-September, and October-December) and is separated into three approach directions relative to shore. (WES)

RECONNAISSANCE DATA ON LAKES IN WASHINGTON--VOLUME 2. KING AND SNOHOMISH COUNTIES,
Geological Survey, Tacoma, Wash.
G. C. Bortleson, N. P. Dion, J. B. McConnell, and L. M. Nelson.
Washington Department of Ecology, Olympia, Water-Supply Bulletin 43, Vol 2, 1976. 424 p, 1 fig, 13 ref.

Descriptors: *Lakes, *Lake morphology, *Lake morphometry, *Water quality, *Washington, *Data collections, Bathymetry, *Aerial photography, Lake shores, Mapping, Water analysis, Physical properties, Chemical analysis.
Identifiers: King County(Wash), Snohomish County(Wash).

A total of 156 lakes in King and Snohomish counties of western Washington was sampled using helicopter or boat to obtain information on lake physical, cultural, and water-quality conditions. Physical parameters were determined from topographic and bathymetric (bottom-contour) maps of the lakes. If bathymetric maps were not available, the lakes were sounded and charted using a continuous-recording fathometer. By use of aerial photographs and lake depths, the bathymetric data were digitized and transferred to computer cards which served as input to a computerized program that calculated lake morphometric parameters (for example, lake volume, surface area, and length of shoreline). Vertical profiles of temperature and dissolved oxygen were measured in the deepest part of each lake. Secchi-disc visibility was determined also. Water samples were collected for color, nutrient, and specific-conductance analyses at depths 3.0 feet below the water surface and 3-5 feet above the lake bottom. Samples for fecal-coliform bacteria were collected at selected nearshore sites, approximately 100 feet offshore at a depth of 1 foot below the water surface. (Woodard-USGS)

TEMPERATURE STEPS IN LAKE KIVU: A BOTTOM HEATED SALINE LAKE,
Massachusetts Inst. of Tech. Cambridge. Dept. of Earth and Planetary Sciences.
F. C. Newman.
Journal of Physical Oceanography, Vol. 6, No. 2, p 157-163, March 1976. 10 fig, 11 ref. ONR N00014-67-A-0204-0048, NSF A30729X.

Descriptors: *Temperature, *Saline lakes, *Heated water, Salinity, Salts, *Water temperature, Geothermal studies, On-site data collections, On-site investigations, Instrumentation, Interfaces, Lakes, Limnology, Profiles, Africa.
Identifiers: *Lake Kivu(Dem Rep of Congo-Rwanda).

Vertical profiles of temperature microstructure in Lake Kivu were obtained with 'mini-microstructure recorders' developed by C.S. Cox and William Johnson at Scripps Institution of Oceanography. The profiles revealed three depth intervals containing many isothermal layers typically 0.25-2 m thick and of increasing temperature increments 0.01-0.03 C from layer to layer. Approximately 150 such layers appeared in a single profile. Double-diffusive convection was assumed and the results of Huppert and of Turner were applied to calculate an upward heat flux of 0.71 to 1.6 W/sq m and a corresponding upward salt flux equal to one-fifth

of the average salt output of the lake's only outflow. The chief source of heat and salt is probably geothermal springs in the lake bottom. (Sims-ISWS)

REPRODUCTION OF THE BANDED KILLIFISH: FUNDULUS DIAPHANUS DIAPHANUS (LE SUEUR), (IN FRENCH),
Service Faune Auebec, St. Faustin. Station for Pisciculture.
P. Fournier, and E. Magnin.
Nat Can (Que) 102(2), p181-188, 1975.

Descriptors: *Fish reproduction, *Killifishes, Canada, Lakes, Fish population, Gonads.
Identifiers: Banded fish, Funculus-Diaphanus-Diaphanus.

The relationship between gonad weight and total body weight for the female banded killifish F. diaphanus (Le Sueur), indicates that postpawning egg development is slow until spring. With increasing water temperatures in early June, the weight of ovaries and testicles increases rapidly until the spawning season, 6 wk. later. All males and most females in Lakes Stant-Louis and Renaud (Canada) are mature when 2 yr old. Sexual maturity appears to be a function of size rather than age. The minimum lengths at which female banded killifish produced mature eggs, in lakes Saint-Louis and Renaud, were 42 mm and 47 mm, respectively. Females comprise 75% of the population in Lake Saint-Louis and 55% in Lake Renaud. Spawning occurs in both lakes in July lasting a minimum of 3 wk when water temperatures range from 21-23C.--Copyright 1975, Biological Abstracts, Inc.

PRODUCTION OF A SEMI-VOLTINE CHIRONOMID, CHIRONOMUS COMMUTATUS STR., IN LAKE PORT-BIELH (CENTRAL PYRENEES), (IN FRENCH),
Toulouse-3 Univ. (France). Laboratoire d'Hydrobiologie.
H. Laville.
Ann Limnol 11(1), p 67-78, 1975.

Descriptors: Lakes, Productivity, Europe, Biomass, *Crustaceans, Brown trout.
Identifiers: Chironomus-Commutatus, Port-Bielh, Pupation, Pyrenees, Salmo-Trutta-Fario, Semivoltine.

The net annual production of C. commutatus was estimated in 1971-72 as 6.29 kg/ha/dry weight, 2nd in importance in the production of the littoral-profundal benthic commuty of the Lake (in France). The value of the ratio P/Bmax (production/maximum biomass) = 1.49 confirms the stability of this ratio, a stability which has been previously shown for several representatives of the benthos and more recently for 2 monocyclic species of Crustacea from the same lake. Of the production, 36% is lost by the ecosystem during the pupation (30%) and emergence of the adults (6%). Brown trout (Salmo trutta fario) utilize 10.5% of the production of C. commutatus when they feed on the ascending pupae; this represents 49 kg/wet weight for the 10.5 ha of the zone between the depths of 7-19 m. -- Copyright 1975, Biological Abstracts, Inc.

MODEL STABILITY, RESILIENCE, AND MANAGEMENT OF AN AQUATIC COMMUNITY,
Washington State Univ., Pullman. Dept. of Zoology.
G. E. Long.
Oecologia (Berl). 17(1), p 65-86, 1974.

Descriptors: *Model studies, *Algae, Population, *Aquatic populations, Stability, Management, Lakes, Environmental effects, *Biological communities, *Ecosystems, Nitrogen, Potassium.
Identifiers: Daphnia-Galeata, Resilience, Verhulst-Pearl logistic model.

A community model may be considered stable when, the absence of exogenous variation, all population trajectories encircle or asymptotically approach equilibrium. Community models in which, in the absence of analytical indications of stability, all populations either exhibit trajectories toward equilibrium or posses properties such that departures from equilibrium are inhibited, will be defined as resilient. The necessary properties include appropriate sensitivity (i.e., the total derivative, dfi/dVj, of the ith species function, fi = dNi/dt, with respect of the jth variable) to exogenous variables. A real, though simplified, ecological system consisting of Daphnia galeate and its algal food source in an oligotrophic lake appears to be generally resilient in that changes in the exogenous factors nitrate concentration and temperature of the lake water consistently restrain the departure of predicted population densities from equilibrium. Each population in the community is represented by the Verhulst-Pearl logistic model of population growth augmented to include environmental effects on rate of increase, r; carrying capacity, K; and the effects of predation on population density, N; and therefore the population rate of change, dN/dt. Such community submodels and sensitivity analysis represent logical and appropriate amplifications in the use of mathematical models in the management of populations.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Carp, Reservoir, Growth rates, Fish reproduction, Fish eggs, Fish populations.
Identifiers: Azerbaijan-SSR, *USSR(Mingechaur Reservoir).

Carp in the Mingechaur Reservoir on the Kura River in the Azerbaidzhan SSR (USSR) reach a length of 70.0 cm and weight of 8040 g. Fish 35-35 cm long and weighing 922-1768 g comprise the bulk of the fish caught. The age of the sexually mature carp varies from 3-10 yr; fish 4-5 yr old predominate in the catch. Since the construction of the reservoir in 1955, significant changes have not occurred in the structure of the carp population. The carp of the Mingechaur Reservoir lag in growth rate behind the carp of other water bodies of the Azerbaidzhan SSR. The fecundity of the carp averages 144,500 eggs.--Copyright 1975, Biological Abstracts, Inc.

LONG-TERM CHANGES IN THE PLANKTON OF LAKE TYRIFJORD, NORWAY,
Kongeliege Norske Videnskabers Selskab, Trondheim. Museet.
A. Langeland.
Norw J Zool. 22(3), p 207-219, 1974.

Descriptors: Lakes, *Phytoplankton, Europe, Zooplankton, Daphnia, Algae, Diatoms, Rotifers, Seasonal.
Identifiers: Cyclops-scutifer, Daphnia-cristata, Diatomeae, Fragilaria-crotonensis, Limnocalanus-macrurus, Mesocyclops-leuckarti, Mesocyclops-oithonoides, *Norway(Lake Tyrifjord), Oscillatoria-rubescens.

Phyto-and zooplankton investigations were carried out in the freshwater Lake Tyrifjord, Norway, from 1957-1973, and the results compared with plankton investigations made in 1930. The phyto-and zooplankton communities had changed both quantitatively and qualitatively, the most important changes being an increased standing crop and biomass of Diatomeae algae and rotifers, decreased occurrence in summer of Limnocalanus macrurus and the likely introduction of new phyto- and zooplankton species such as Oscillatoria rubescens, Fragilaria crotonesis, Daphnia cristata, Cyclops scutifer, Mesocyclops leuckarti and Mesocyclops oithonoides. The present ecological conditions in Lake Tyrifjord may be interpreted as a stage in an incipient eutrophication of the lake.--Copyright 1975, Biological Abstracts, Inc.

A HYDRODYNAMIC APPROACH TO THE MICRODISTRIBUTION OF BENTHIC INVERTEBRATES IN RUNNING WATER, (IN FRENCH),
Toulouse-3 Univ. (France). Laboratoire d'Hydrobiologie.
H. Decamps, G. Larrouy, and D. Trivellato.
Ann Limnol 11(1), p 79-100, 1975.

Descriptors: *Invertebrates, Benthos, *Distribution, Europe, Larvae, Streams.
Identifiers: *Simuliidae, *France.

The microdistribution of larvae and pupae of 3 spp. of Simuliidae (Odagmia variegata, O. obreptans and Simulium repicolum) was observed in different streams in the Pyrenees (France). These species occur where there is high water velocity which, in the streams studied, was present in zones with torrential discharge. They were not found in zones with a general fluvial discharge. Smooth stones with a diameter greater than about 10 cm are the most frequently colonized substrata. The surfaces facing upstream and slightly inclined carry the greatest densities of larvae. In fast flowing zones with a longitudinal gradient of reduction in velocity, the larvae are concentrated in a narrow band where the velocity is highest. The body of the larva lies in a downstream direction and moves with the pulsations of the current. The larvae of Simuliidae rapidly colonize channels immersed in the stream and it is possible to decline the hydrological conditions at the places where the larvae are attached. The flow varies with time at the same station and the discharge can change from a fluvial type to a torrential type. The profile of currents at the surface (in the zone where the invertebrates are living) can be determined as a function of the relative roughness of the surface. The presence of a laminar film (laminar sub-layer) depends upon the strength of the current and the unevenness of the substratum. For a given current speed, the relationship between the thickness of the laminar film and the index of roughness or uneveness affects the possible formation of a laminar film. The variation in the thickness of the laminar film is a function of current speed. The laminar film has only a small influence on the living conditions of larvae of Simuliidae; turbulence is an important factor. -- Copyright 1975, Biological Abstracts, Inc.

CHANGES IN THE MICROPHYTOCENOTIC COMPOSITION OF QUACK GRASS MEADOWS IN THE FLOOD PLAIN OF THE LOWER DON IN DIFFERENT YEARS, (IN RUSSIAN),
Kalmyk State Univ., Elista (USSR).
V. A. Bananova, and B. N. Gorbachev.
Bot Zh (Leningr) 60(3), p 432-437, 1975.

Descriptors: *Flood plains, *Grasses, Succession.
Identifiers: Agropyron-Repens, Beckmania-Eruciformis, Phytocenotic composition, Quack grass, *USSR(Don River).

A 3-yr study of quack grass (Agropyron repens) meadows in the floodplain of the lower Don (USSR) established that the microphytocenotic structure of the quack grass meadow changes markedly depending on the presence or absence of floods. Of the 31 microassociations noted on this meadow, only 8 were found in all years of observation, the others existed only for 1 or 2 yr. In the flood year (1970) the composition of the quack grass association included more hygrophytic slough grass (Beckmania eruciformis)- quack grass microphytocenoses (microcommunities), and in floodless years their area first contracted, then disappeared from the grass stand. The relationship between species in the same microassociation also changed. On the basis of the changes of the microphytocenotic composition of associations in different years it is possible to determine the direction of succession.--Copyright 1975, Biological Abstracts, Inc.

RESISTANCE TO WATER FLOW IN SOIL AND PLANTS, PLANT WATER STATUS STOMATAL RESISTANCE AND TRANSPIRATION OF ITALIAN RYEGRASS, AS INFLUENCED BY TRANSPIRATION DEMAND AND SOIL WATER DEPLETION,
Royal Veterinary and Agriculture Co..., Copenhagen (Denmark). Hydrotechnical Lab.
G. K. Hansen.
Acta Agric Scand. 24(2), p 83-92, 1974.

Descriptors: *Plant-water-soil relationships, *Water requirements, *Transpiration, Resistance, *Grasses, Soil physics.
Identifiers: Italian ryegrass, Lolium-Multiflorum, *Plants, *Rye grass.

Influence of water stress and transpiration demand on relative water content, resistance to water flow in soil and plants, stomatal resistance and transpiration of Italian ryegrass (Lolium multiflorum) was studied in growth chambers. The pooled resistance to water flow in soil and plants, Rs + Rp, determined as the ratio between the water potential drop from soil to leaves and transpiration, was analyzed. Resistance to water flow in soil, Rs, was estimated based on theories of soil physics. Assuming one-tenth, one-fifth and the entire root system acting as an effective sink for water, Rs showed no agreement with the determined Rs + Rp. Correction for Rs for a soil-root interface resistance dependent on soil-water content did not result in any agreement either. Rs at the actual root densities (18 cm cm-3) was not limiting within a range of 0.1-15 bars of soil-water potential (psi s). The relation was independent of the variation in the water potential drop whether it was obtained by change in transpiration demand or by change in soil-water content. The resistance of plants, Rp, decreased with increasing flow rate. No unique relation between Rp and leaf-water potential was found. Stomatal resistance, rs, and transpiration during water stress, related to that of non-stressed plants, T Tm-1, decreased steeply when psi 1 decreased further below -11 bars. Linear correlation between rs-1 and T Tm-1 was found. Copyright 1974, Biological Abstracts, Inc.

DYNAMICS OF THE ANNUAL GROWTH OF PINUS SYLVESTRIS L. IN THE TURGAI VALLEY IN CONNECTION WITH CLIMATIC FACTORS, (IN RUSSIAN),
Kustanai Pedigogical Institut (USSR).
P. G. Pugachev.
Bot Zh (Leningr) 60(3), p 401-412, 1975.

Descriptors: *Scotch pine trees, Growth rates, Ecology, Climates, *Dendrochrosology, Forests.
Identifiers: Kazakh-SSR, Steppe, *USSR(Turgai Valley).

A dendroclimatic investigation of the growth of Scotch pine (P. sylvestris) of the insular pine forests in the Turgai valley in the Kazakh SSR (USSR) showed a direct relationship between annual growth and the ecological conditions in different climatic zones, from the forest-steppe to the semidesert. In the vegetation period the amount of precipitation in June-July has a decisive effect on the width of the annual rings of trees. In individual periods certain relationships between growth anomalies and a central form of atmospheric circulation are manifested for pine under steppe and desert conditions. Cycles of 9-11 yr were noted in the long-term growth of pine forests in the dry steppe-semidesert zone; 22-yr growth cycles were noted in trees of the more northern, steppe pine forests.--Copyright 1975, Biological Abstracts, Inc.

THE USE OF OVERWINTER DRAW DOWN FOR AQUATIC VEGETATION MANAGEMENT,
Wisconsin Univ. Extension, Madison. Environmental Resources Unit.
S. A. Nichols.
Water Resources Bulletin, Vol. 11, No. 6, p 1137-1148, December 1975. 5 fig, 6 tab, 8 ref.

Descriptors: *Drawdown, *Winter, *Aquatic plants, *Management, Water quality, Nutrients, Wisconsin, Sampling, Chemical analysis, Vegetation, Fish, Water levels.
Identifiers: Water depth, Stem flow, Mondeaux flowage, Zizania aquatica.

Overwinter drawdown can be a useful technique for aquatic plant management. Its effectiveness depends largely on the susceptibility of nuisance species to drawdown. A single overwinter drawdown provided good control of aquatic plants in a flowage dominated by Potamogeton robbinsii. Little additional control was gained by a second drawdown the following winter. Rapid reinvasion of plants after drawdown ceased dictates continued management. To avoid fish kills caused by low dissolved oxygen levels, caution is advised when using overwinter drawdown. The growth of Zizania aquatica was not negatively influenced by drawdown. The influence on water quality of nutrient release from decaying vegetation and exposed bottom sediments was uncertain. TOPOGRAPHIC EXPRESSION OF SUPERIMPOSED DRAINAGE ON THE GEORGIA PIEDMONT,
Georgia State Univ., Atlanta. Dept. of Geology.
A. C. Staheli.
Geological Society of America Bulletin, Vol. 87, No. 3, p 450-452, March 1976. 4 fig, 6 ref.

Descriptors: *Geomorphology, *Topography, *Drainage patterns(Geologic), *Georgia, Streams, Stream erosion, Coastal plains, Sediments, Geology, Drainage, Sediment transport, Headward erosion.
Identifiers: *Georgia Piedmont, Brevard zone, Stream capture, Sedimentary deposition.

The Brevard zone separates two regions on the Georgia Piedmont that have different drainage styles. Streams on the northwestern Piedmont have trellis drainage, which suggests that they have undergone a different evolution than streams that have dendritic drainage, on the southeastern Piedmont. It was concluded that Coastal Plain sediment covered the southeastern Georgia Piedmont to at least the Brevard zone. Consequent streams developed a dendritic drainage on this cover and became superimposed across buried resistant northeast-trending geologic structures. Trellis drainage, however, developed as a result of subsequent streams being controlled by Piedmont structures on areas of thin or no Coastal Plain sediment cover. (Lee - ISWS)

MEASUREMENT AND PREDICTION OF SEDIMENT YIELDS IN WISCONSIN STREAMS,
Geological Survey, Madison, Wis.
S. M. Hindall.

Available from the National Technical Information Service, Springfield, Va 22161, as ADA-022 059, $4.00 printed copy; $2.25 microfiche. Water-Resources Investigations 54-75, January 1976. 27 p, 6 fig, 4 tab, 22 ref.

Descriptors: *Sediment transport, *Sediment yield, *Wisconsin, *Streams, Suspended load, Gaging stations, Data collections, Particle size, Bed load, Equations, Streamflow forecasting, Methodology.
Identifiers: *Ungaged sites, *Sediment yield forecasting.

Sediment data have been collected by the U.S. Geological Survey at 118 streamgaging sites throughout Wisconsin beginning in 1935. Enough data were collected at 84 of these sites to calculate average annual suspended-sediment transport. Measured average annual yields range from about 680 tons per square mile (238 tonnes per square kilometre) in the 'Driftless Area' to 3.1 tons per square mile (1.1 tonnes per square kilometre) in the Northern Highland province. The average suspended-sediment yield for Wisconsin is about 80 tons per square mile per year (38 tonnes per square kilometre per year). Sediment-yield prediction equations for four geographic provinces make it possible to predict average annual sediment yield at any point on 95 percent of the streams in the State. The prediction technique involves regression equations that relate average annual suspended-sediment yields to the controlling physical factors. The standard error of estimate for these four equations, which only represent the accuracy of an estimated sediment yield at an ungaged site, ranges from 28 to 38 percent. (Woodard-USGS)

A BOTTOM SEDIMENT TRAP FOR RECENT SEDIMENTARY DEPOSITS,
National Swedish Environment Protection Board, Uppsala. Limnological Survey.
L. Hakanson.
Limnology and Oceanography, Vol. 21, No. 1, p 170-174, January 1976. 5 fig, 12 ref.

Descriptors: *Sedimentation, *Sedimentation rates, *Lakes, Deposition(Sediments), Sediment distribution, Sediment load, Settling velocity, Sedimentology, Sediments, Sampling, Equipment, Limnology.
Identifiers: *Sediment traps, Sediment samplers.

A bottom trap for collection of recent sedimentary deposits has been constructed and field tested. The technique provides material, deposited within a known time span, unaffected by bioturbation in the upper biologically active sediment layer. The trap has an area of 1541 sq cm and an edge height of 5 cm. Before retrieval, a lid is lowered onto the trap. The apparatus is easy to handle and has yielded representative values for the rate of deposition. (Sims-ISWS)

ERODIBILITY OF TAHOE SOILS,
M. Singer.
In: Proceedings: Lake Tahoe Research Seminar II, 27 September 1974, Sands Vagabond Convention Center, South Lake Tahoe, California. Report No. NSF/RA/G-74-012, p 79-88.

Descriptors: *Erosion, *Sedimentation, *Accelerated erosion, Forests, Mountains, Soil erosion, Erosion rates, Sediment yield, Slopes, Precipitation(Atmospheric), Simulated rainfall.
Identifiers: *Lake Tahoe(Nev-Calif).

The erosion program at Tahoe has three major focuses: (1) to measure actual amounts of erosion occurring on different kinds of soil, (2) to determine actual erodibility of soils, and (3) to trace the sources of sediments found in streams. Plots were established at seven sites on seven different soil series. The plots were 50 feet long and 6 feet wide, surrounded on three sides by redwood borders which were buried in the soil and extend a bit above the soil surface so that just erosion and just sediment movement within those borders could be measured. At the bottom end of the plots a pit was dug and lined with a cloth so that the sediment could be caught and weighed after different storm events. Rainfall on each of the sites was measured. The data from the plots were used to develop mathematical models to predict erosion. The basic chemical and physical properties of the different kinds of soils found in the Tahoe Basin were used to trace sediments from their source to the lake. (See also W76-07793) (Sims - ISWS)

TRACE ELEMENTS IN SURFACE WATERS OF THE KARAGANDA OBLAST, (IN RUSSIAN),
E. A. Solodnikova.
Izv Akad Nauk Kaz SSR Ser Biol. 1, p 48-51, 1974.

Descriptors: *Trace elements, Surface waters, Copper, Zinc, Cobalt, Boron, Iodine, Manganese, Irrigation, Water sources, Molybdenum.
Identifiers: *USSR(Karaganda Oblast).

Surface waters (river, lakes, reservoirs) of the Karaganda Oblast, Kazakh SSR, USSR were investigated for their content of Cu, Zn, Mn, Co, Mo, B and I. The quantity of trace elements in them permitted the conclusion that the waters are completely suitable for drinking and irrigation. In the case of a deficiency of trace elements in soils and forage plants the water sources with such a content of these elements do not make up for their deficit in soils and forage. The content of trace elements in 39 water sources are given.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Gulf coastal plain, *Inland waterways, *Channels, Documentation, Publications.
Identifiers: *Gulf intercoastal waterway, *Navigation directories, *River point directory, Waterborne commerce.

The River Point Directory is a quick-reference working document for use by engineers and planners in the general fields of river navigation and waterborne commodity movements. All navigable rivers, bayous, streams, and other such waterways in the Mississippi River-Gulf Coast region are included. The rivers are, in general, listed in the order of their importance as commodity transportation arteries with regard to varying degrees of impact on the economic welfare of the United States. The Directory is, in essence, a compilation of significant data relating to each commercial dock, town, landing, navigation lock, bridge, junction, and other such river points contained in selected portions of the U. S. Army Engineer Waterborne Commerce Statistical Center (WSCS) Port and Dock Code Manual (Parts 2 and 3), dated 1 January 1973. (WES)

FORM, GENESIS, AND DEFORMATION OF CENTRAL CALIFORNIA WAVE-CUT PLATFORMS,
Colorado Univ., Boulder. Dept. of Geological Sciences.
W. C. Bradley, and G. B. Griggs.
Geological Society of America Bulletin, Vol. 87, No. 3, p 433-449, March 1976. 16 fig, 5 tab, 123 ref. NSF G19774.

Descriptors: *Geomorphology, *Shoreline cover, *California, Shores, Sea level, Deformation, Folds(Geologic), Bedrock, Sediment transport, Erosion, Waves(Water), Currents(Water), Quaternary period.
Identifiers: *Shore features, *Ben Lomond Mountain(Calif), Marine terraces, Sea level changes,

Uplift rates, Platforms, Platform ages, Terrace deposits, Nearshore process, Wave drift.

Modern and ancient wave-cut platforms on Ben Lomond Mountain in central California are broadly similar in shape. They have a seaward slope composed of two segments: a steeper, slightly concave inshore segment, with gradients of generally 0.02 to 0.04, and a flatter, planar offshore segment with gradients of 0.007 to 0.017. The flattest inshore and offshore gradients measured were, respectively, 0.015 and 0.005, suggesting that these are close to minimum gradients for erosional platforms in central California. The inshore segments are generally 300 to 600 m wide and extend to a depth of 8 to 13 m. Platforms are widest in areas where soft sandstone crops out and where there has been least uplift. Major storm waves now break in water 7 to 12 m deep. It was concluded that inshore platform segments were associated with storm-wave surf zones and that offshore segments were associated with the zone of deep-water wave transformation. Ben Lomond platforms have been uplifted and progressively tilted in a seaward direction, indicating that late Tertiary domical uplift has continued into Quaternary time. Uplift rates have ranged from 0.16 m/1000 yr near Santa Cruz to 0.26 m/1000 yr near Greyhound Rock. (Lee - ISWS)

Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 101, No. WW4, Proceedings Paper 11709, p 419-433, November 1975. 14 fig, 2 tab, 9 ref, 3 append. ONR N00014-67-A-0369-007.

Descriptors: *Anchors, *Buoys, *Research equipment, Model studies, Mathematical models, Numerical analysis, Simulation analysis, Loads(Forces), Peak loads, Stress, Velocity, Mechanical properties, Equipment, Analytical techniques, Mechanical engineering, Oceanography.
Identifiers: Lumped-mass solutions, Dynamic response, Cables, Moorings.

Often the anchor is deployed as the final action in the mooring of buoys in the water. It has not been economical to calculate the transient conditions in the mooring line until a predictor-corrector technique was developed, which calculates the positions of the anchor and mooring line, the accompanying velocities, and the tensions throughout the line, all as a function of time. This study was based on a numerical lumped mass model representation of a single continuous nylon line 5000 ft long. The results obtained showed no line snap loads for the configurations considered. It appears that the high drag of the long mooring line quickly dissipates the kinetic energy of the anchor and reduces the anchor velocity to about 10 fps-15 fps. The buoy horizontal velocity of 10 fps would tend to indicate the potential for large dynamic loads from wave motion. (Sims - ISWS)
W76-07559

A WIND-DRIVEN NEAR-BOTTOM CURRENT IN THE SOURTHERN NORTH SEA,
British Petroleum Co. Ltd., Sunbury-on-Thames (England). Research Centre.
V. N. D. Caston.
Estuarine and Coastal Marine Science, Vol. 4, No. 1, p 23-32, January 1976. 5 fig, 22 ref.

Descriptors: *Currents(Water), *Ocean currents, *Winds, Sediment transport, Tides, Offshore platforms, Oil wells, On-site investigations, Wind tides, Wind velocity, Oceanography.
Identifiers: *North Sea.

Simultaneous recordings of wind and near-bottom current velocity and direction were made over the period November 8-December 16, 1967 from two production platforms situated in the southwestern North Sea. The current measurements were made 4.6 m above sea bed in a total water depth of 34.7 m LAT. Throughout the greater part of the period the recorded current velocities agreed closely with predicted values calculated on the basis of a correlation with tidal range data. Over a 125-hr period, however, the south-going currents were very much stronger and the north-going streams considerably less than anticipated. This corresponded with a period of high wind speeds which touched 25.7 m/s (50 kts) and exceeded 18 m/s (35 kts) for 68 hr and which blew sub-parallel to the direction of flow of the southerly-flowing current. The increase in velocity of the near-bottom southerly-going current averaged 23 cm/s, exceptionally 36 cm/s, and was equivalent to a figure of between 1.4 and 2% of the wind speed. It was suggested that these anomalously high values may be related to a shift in the axes of current streams flowing between sand banks adjacent to the platform from which the current measurements were made. ESTABLISHMENT OF VEGETATION FOR SHORELINE STABILIZATION IN GALVESTON BAY,
Texas A and M Univ., College Park, Dept. of Range Science.
J. D. Dodd, and J. W. Webb.
Available from the National Technical Information Service, Springfield, Va., 22161, as AD-A012 839, $4.50 in paper copy, $2.25 in microfiche. Coastal Engineering Research Center Miscellaneous Paper No. 6-75, April 1975. 67 p, 13 fig, 27 tab, 20 ref. CERC DACW72-74-C-0002

Descriptors: *Shore protection, *Vegetation, *Erosion, *Texas, Vegetation establishment, Marsh plants, Coastal marshes, Shoreline cover, Salinity, Salt tolerance, Saline soils, Bays, Estuaries.
Identifiers: *Galveston Bay(Tex), *Upper Texas Coast, Wave stilling.

The objective of this study was to determine which resident species of plants adapted to saline conditions can be used to control shore erosion in bays or estuaries. Water salinity and soil physical and chemical characteristics were determined at the experimental planting sites at East Bay near Galveston, Texas. The soil was loam or clay-loam texture and was structurally unstable and subject to wave erosion. Soil salinity varied from 2500 to more than 12,000 parts per million and water salinity from below 2500 to 18,000 parts per million. Twelve plant species were selected for evaluation of their ability to stabilize the shoreline. Giant reed (Arundo donax) is effective in the upper zone (above MHW). Black mangrove (Avicennia germinans) can establish in the middle zone (MLW to MHW) and lower zone (below MLW). Saltgrass (Distichlis spicata) may be used in the middle zone if wave action is low at planting time. Gulf cordgrass (Spartina spartinae) is adapted for use in the upper zone and smooth cordgrass (Spartina alterniflora) is well adapted for use in the middle and lower zones. Several combinations of species were suggested for different zones. An inexpensive wave-stilling device to protect planting from wave action was described. (Sims-ISWS)

AN INVESTIGATION OF THE OCCURRENCE OF OCEANIC TURBULENCE WITH RESPECT TO FINESTRUCTURE,
Department of the Environment, Victoria (British Columbia). Inst. of Ocean Sciences.
A. E. Gargett.
Journal of Physical Oceanography, Vol. 6, No. 2, p 139-156, March 1976. 9 fig, 2 tab, 24 ref.

Descriptors: *Oceans, *Turbulence, *Temperature, *Salinity, *Pacific Ocean, *Mixing, Density, Surveys, Measurement, Instrumentation, Circulation, Ocean circulation, On-site data collections, Oceanography, Profiles, Stratification.
Identifiers: *Finestructure.

Data obtained from the cycling mode of a towed system operated in the North Pacific were used to investigate the relationship of small-scale mixing to the finestructure which seems to be such a common characteristic of vertical profiles of oceanic water properties. The signal from a high-frequency response platinum-film thermometer was used, with the local mean vertical temperature gradient, to produce variables proportional to heat flux and eddy diffusivity for heat. Along with measured values for the local vertical salinity and density gradients, this information was used to examine some questions of interest in the general understanding of turbulence and finestructure. It was shown that in regions where the vertical density structure is distinctly layered, there is no noticeable tendency for mixing to occur preferentially on 'sheets,' the high-density-gradient regions which separate 'layers' of lower density gradient. Mixing events seem to occur at random with respect to the density field, suggesting that such events do not arise predominantly as small-scale Kelvin-Helmholtz instabilities on pre-existing finestructure. Instead, the evidence points to a much closer connection between turbulent mixing and the processes which act to produce and destroy finestructure. Between 60 and 70% of the turbulence encountered in the tows was associated with 'active' regions, areas where the vertical profiles of temperature and/or salinity show finestructure inversions. The density profile in such regions is often 'steppy' but invariably statically stable on vertical scales greater than about a meter, so that some basically horizontal process, such as inertial waves or density-driven interleaving, is required to produce the inversions in temperature and salinity. (Sims - ISWS)

Identifiers: *Cape Blanco(Ore).

The wind driven, x-y-t, two-layer beta-plane numerical model developed by Hurlburt was used to investigate the effects of a bottom topography and coastline configuration, like that off Oregon, on the onset and decay of the ocean upwelling circulation. The digitized nearshore Oregon bathymetry was analyzed for dominant scales, and a smoothed version was used in model cases with several different initial states and wind stresses. Cases with topography were compared to cases with plane sea beds. Topographic variations were found to dominate over coastline irregularities in determining the longshore distribution of upwelling. Results indicated that stronger upwelling observed near Cape Blanco is primarily due to the local bottom topography and not the cape itself. Observed variations in the meridional and zonal flow were attributed to the topographic beta-effect. In particular, during spin-up with an equator-ward wind stress, a nearshore poleward undercurrent is most likely to develop in regions where topographic beta is positive. Upper layer poleward flow was observed during spin-down. The existence of an onshore transport jet south of Cape Blanco was predicted. Zonal mass balance was not observed. Topographic Rossby waves were excited during spin-up. Baroclinic continental shelf waves were observed in time series of the pycnocline height contours. (Sims-ISWS)

A BOUNDARY FRONT IN THE SUMMER REGIME OF THE CELTIC SEA,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
J. H. Simpson.
Estuarine and Coastal Marine Sciences, Vol. 4, No. 1, p 71-81, January 1976. 6 fig, 9 ref.

Descriptors: *Temperature, *Salinity, *Saline water-freshwater interfaces, *Ocean circulation, Buoys, Floats, Measurement, On-site investigations, On-site data collections, Water circulation, Density, Density currents, Oceans, Estuaries, Oceanography.
Identifiers: *Celtic Sea.

Sections through a region of low tidal stream energy in the Celtic Sea in August show a high degree of stratification, which breaks down abruptly at the entrance to the Irish Sea and the Bristol Channel. Radio tracked parachute drogues have been used to observe the flow both along the front and at the center of the low energy region. A temperature-salinity-density section of the front, combined with the drogue observations, indicated that the front contains a strongly baroclinic zone implying velocity components parallel to the front of up to 30 cm/s. The residual velocities observed in the low energy region were found to be in approximate geostrophic balance with the density field and in a westerly direction, with a maximum amplitude of about 9 cm/s. (Sims - ISWS)

SEASONAL REVERSAL OF FLOOD-TIDE DOMINANT SEDIMENT TRANSPORT IN A SMALL OREGON ESTUARY,
Oregon Univ., Eugene. Dept. of Geology.
S. Boggs, Jr., and C. A. Jones.
Geological Society of America Bulletin, Vol. 87, No. 3, p 419-426, March 1976. 13 fig, 3 tab, 24 ref.

Descriptors: *Sedimentation, *Sediment transport, *Oregon, Fluorescent dye, Estuaries, Tides, Tidal streams, Hydrology, Currents(Water), Dye releases, Discharge(Water), Sedimentary structures.
Identifiers: *Bed forms, *Sixes River(Ore), Heavy minerals, Tidal currents, Coastal streams.

The Sixes River in southwestern Oregon has a summer discharge of only about 2 cu m/sec. During these low-discharge conditions, a flood-dominated system of bottom tidal currents develops in the estuary and a deltalike sill, as much as 1.5 m in height, builds across the mouth of the estuary by upstream progradation. Flood-tide currents move across this sill at velocities of as much as 90 cm/sec 15 cm above the bottom, but the velocity of ebb-tide currents usually does not exceed about 40 cm/sec. Dispersal patterns of dyed sediment injected at the river mouth during low river discharge showed that flood-tide currents transport sand across the sill and up the estuary as far as 0.8 km (about one-fourth the length of the estuary) in a single flood-tide phase. During ebb tide, the sill impedes movement of salt water along the estuary bottom, producing a sharply stratified two-layer water system. River discharge after winter storms may increase to more than 400 cu m/sec, and large quantities of detritus, including gravel, are transported downstream into and through the estuary. High river discharge also causes erosion of the sill, greatly reducing the sediment-trapping capacity of the estuary. The finer fluvial detritus, together with fine marine sediment deposited during the summer, is swept from the estuary, leaving it floored largely by gravel. (Lee - ISWS)

COASTAL EROSION HAZARD IN THE UNITED STATES: A RESEARCH ASSESSMENT,
Rutgers - The State Univ., New Brunswick, N. J.
J. H. Sorensen, and J. K. Mitchell.
Available from the National Technical Information Service, Springfield, Va., 22161 as PB-2442 974, $5.00 paper copy, $2.25 in microfiche. Colorado University Institute of Behavioral Science Monograph NSF-RA-E-75-014, 1975. 65 p, 4 fig, 10 tab, 91 ref. NSF GI-32942.

Descriptors: *Coasts, *Erosion, *Hazards, *Research priorities, Coastal structures, Shore protection, Land use, Warning systems, Forecasting, Rehabilitation, Beach erosion, Coastal engineering, Ocean waves, Storms.

Research on coastal erosion has traditionally been centered on control and protection works designed to eliminate erosion causes or to reduce direct damages. Since 1970, Federal initiatives have prompted the development of new adjustment options which hold the promise of diversifying attempts to cope with the hazard. This has set the

stage for research which would enable the nation to make more effective use of new developments in coastal erosion management. Approximately one quarter of the national shorefront is significantly affected by erosion. Critical erosion occurs along 2700 miles of coastline, chiefly on the heavily populated Atlantic and Great Lake coasts. Problems are caused when erosional processes and human activities conflict. Average shoreline recessions of less than one foot per year on densely settled coasts may produce heavy damages, while elsewhere, in sparsely populated coastal areas, annual recessions of more than 20 feet may pose no significant hazard. Both erosion and accumulation are influenced by man-induced, as well as natural processes. Research on coastal erosion is indicated along four major lines: (1) control and protection works, (2) land use management, (3) warnings and forecasting, and (4) relief, rehabilitation, and insurance. The emphasis reflects shifts in management policies in the past few years which may allow significant reductions in erosion damages if the necessary technology and knowledge becomes available. OCEANOGRAPHIC STRUCTURE OF THE MUTU BAY, (IN JAPANESE),
Hokkaido Univ., Sapporo (Japan). Lab. of Oceanography and Meteorology.
K. Ohtani, and T. Terao.
Bull Fac Fish Hokkaido Univ 24(3), p 100-131, 1974.

Descriptors: *Bays, Asia, *Fisheries, Oceanography, Salinity, Seasonal, Stratification, Temperature.
Identifiers: *Japan(Mutu Bay), Scallop.

The Mutu Bay is a spacious, shallow bay in Japan. It is subdivided into a western bay near the mouth and an inner eastern bay. Many kinds of marine food are produced in the bay by fisheries. A large number of scallops are produced by recent development of an artificial cultural fishery. The water of the Tugaru Warm Current, having a high salinity of 34.0% or more, comes into Mutu Bay. During the cool season the vertical distribution of properties becomes almost homogeneous; the horizontal distribution of temperature decreases from the mouth of the bay through the W coast of the western bay toward the eastern bay. The water of the eastern bay, which is relatively colder and less saline than of the western bay, is almost homogeneous in temperature and alin vertically and horizontally. A horizontal discontinuity of properties is clearly formed between the 2 bays. At the beginning of the warm season the water in the surface layer of the Tusima Warm Current, which is the original current of the Tugaru Warm Current, is diluted by melting snow from the mountains in N Japan along the coast of the Japan Sea. The water in Mutu Bay is further diluted, especially in the eastern bay and the inner part of the western bay. The salinity of the surface layer falls to a minimum of 33.0% or less during the year and the vertical salinity gradient increases during this period. Heating from the surface increased the difference in density between the surface layer and lower layer; consequently a large pycnocline is formed between them producing a stratified structure in summer. Through the year, the salinity of the eastern bay is lower than that of the western bay and a horizontal discontinuity zone is continuously formed between them.

THE PRODUCTIVITY OF THE WATERS OF MAR GRANDE AND MAR PICCOLO OF TARANTO (1962-1969), (IN ITALIAN),
A. Vatova.
Boll Pesca Fiscic Idrobiol 27(1); p 81-103, 1972.

Descriptors: Productivity, Lakes, Gulf, Saline water, Climates, Mussels, Plankton, Water temperature.
Identifiers: *Italy, Mar-Grande, Mar-Piccolo, Springs, Taranto.

The Mar Grande of Taranto (Italy) communicates almost freely with the Gulf of the same name; the Mar Piccolo, divided by a bottleneck into 2 basins, is more like a salty coastal lake. From its bottom emerge numerous underwater springs, known as citri, which act as thermosaline regulators, to the advantage of the cultivation of mussels. For 8 yr, in 4 fixed stations, monthly hydrographic measurements were taken, combined with vertical catches of plankton and measurements of productivity with 14C. The environment is affected by the climatic conditions of the region with its heavy winter rains and prolonged summer droughts. The net annual productivity for the Mar Grande, with a surface area of 36.5 km2 and a volume of 0.541 km3, was calculated at 5.3 x 103 metric tons, and for the Mar Piccolo, with a surface area of 20.7 km2 and a volume of 0.152 km3, at 2.8 x 103 metric tons.

STUDY OF OCEANOGRAPHIC CONDITIONS IN THE AROSA ESTUARY IN WATER, (IN SPANISH),
J. G. Gallego.
Bol Inst Esp Oceanogr 185, p 1-53, 1975.

Descriptors: Estuaries, Oceanography, Salinity, Water temperature, Oxygen, Data collections, Winter, Dissolved oxygen.
Identifiers: *Spain(Arosa estuary).

Data were obtained from 25 stations distributed over the entire estuary from Jan. 20th-Feb. 26th 1969. The variations in temperature and salinity in relation to the space, depth, time and state of the tide were studied together with the intensity and direction of the currents, according to depth and tide. The stability of the water and, on a more superficial level, the dissolved O2 were also studied. The in situ meteorological conditions were constantly accounted for.--Copyright 1975, Biological Abstracts, Inc.

APPLICATIONS OF SHANNON'S INDEX TO THE STUDY OF INTERTIDAL VEGETATION, (IN FRENCH),
Instituto de Investigaciones Pesqueras, Vigo (Spain). Laboratorio de Investigaciones Pesqueras.
X. Niell.
Bull Soc Phycol Fr 19, p 238-254, 1974.

Descriptors: *Productivity, Vegetation, Succession, Maturity, Intertidal areas.
Identifiers: *Shannons Index.

The Shannon index has been used to study benthic community structure. Using this index to measure diversity, a minimum work area is determined. Different types of vegetation become evident when the limits of the spacial distribution are studied. These types are related to ecological accidents. Diversity values are used to know the community structure, its importance in succession and its maturity. Diversity indexes are related to productivity and biomass intuitively. MINIMAL AREA AND ALGAL MARINE SETTLEMENTS, (IN FRENCH),
Aix-Marseille-2 Univ. (France). Laboratoire de Biologie Vegetale.
C. F. Boudouresque.
Bull Soc Phycol Fr 19, p 141-157, 1974.

Descriptors: *Algae, Europe, Coasts, Data collections, *Marine algae.
Identifiers: *France.

Data were collected from 3 samples at 2 sites of the Pyrenees-Orientales (French Mediterranean coast). For each sample, a number of contiguous 4 cm2 quadrats were examined. Species presence in every quadrat was noted. Species-area graphs show a rapid initial rise followed by a decline in the rate of increase. These graphs justify the selection of 500 cm2 areas as the minimal area. Similarity indices-area graphs justify a smaller and less empirical minimal area (200 cm2).--Copyright 1975, Biological Abstracts, Inc.

AMERICAN LOBSTERS AT ARTIFICIAL REEFS IN NEW YORK,
New York Dept. of Environmental Conservation, Delmar. Wildlife Research Lab.
P. T. Briggs, and C. S. Zawacki.
N Y Fish Game J. 21(1), p 73-77, 1974.

Descriptors: *Lobsters, Atlantic Ocean, Bays, Population, *Reefs, *New York.
Identifiers: *Artificial reefs, Great South Bay(NY).

The American lobster (H. americanus) was studied at 2 artificial reefs, one in Great South Bay (New York) and the other in the Atlantic Ocean. Different catch rates, sizes and sex ratios were observed at these reefs. The differences in population parameters appeared to be primarily a result of onshore migration of adult lobsters from offshore stocks to the oceanic reef. Higher catch rates at the oceanic reef were attributed to both longer fishing time for the gear there and the onshore migration of lobsters from offshore stocks.--Copyright 1974, Biological Abstracts, Inc.

APPLICATION OF SYSTEM ANALYSIS IN TWO-STAGE REVERSE OSMOSIS PROCESS DESIGN FOR WATER DESALINATION,
National Research Council of Canada, Ottawa, Division of Chemistry.
H. Ohya, S. Kasahara, and S. Sourirajan.
Desalination, Vol. 16, No. 3, p 375-393, June 1975. 9 fig, 1 tab, 8 ref.

Descriptors: *Reverse osmosis, *Desalination, *Systems analysis, *Water treatment, *Water quality, Design, Water supply, Operations, Pressure, Flow rates, Computers, *Waste water treatment.

The concepts of system specification and systems analysis concerning reverse osmosis transport have been extensively developed and discussed in the literature; the application of these concepts to single-stage reverse osmosis process design for water desalination has been reported. This paper illustrates a similar application of the above concepts for a two-stage desalination process. The basic equations used have already been derived and are readily available in the literature. The problem is concerned with reverse osmosis desalination of an aqueous sodium chloride solution using Loeb-Sourirajan type cellulose acetate membranes to yield potable water. Further, the problem is to calculate the minimum power requirements for producing 1000 gallons of potable water, and the total membrane area requirements for a million gallons of potable water per day plant on the basis of specified operating requirements. The systems analysis approach illustrated herein offers a useful method for both two-stage and single-stage process design and optimization for reverse osmosis desalination. (Bell-Cornell)

PRELIMINARY OBSERVATION ON SEASONAL CHANGES IN THE SALT CONTENT OF AN IRRIGATED SOIL UNDER WHEAT-MAIZE ROTATION,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
Arjan Singh, and N. T. Singh.
J Indian Soc Soil Sci. 22(2), p 156-161, 1974.

Descriptors: *Seasonal, *Corn(Field), *Wheat, *Rotations, *Saline soils, Irrigation, Water table, Soil profiles, Soil moisture.

Seasonal changes in the salt content of an irrigated sandy soil under maize-wheat rotation were recorded. Water table depth in the area fluctuated and was within 150 cm from the surface during the monsoon season. Salt accumulation at and near the soil surface was at maximum during the hotter days of summer but returned to the previous level after the end of monsoon season. Salt balance of the profile did not change appreciably during the 2-yr period. Monsoon rains appear to be very effective in checking salt build-up in the surface soil.--Copyright 1975, Biological Abstracts, Inc.

PERSPECTIVE ON USE OF FRESH WATER FOR COOLING SYSTEMS OF THERMOELECTRIC POWERPLANTS IN FLORIDA,
Geological Survey, Tallahassee, Fla.
G. H. Hughes.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-250 937, $4.00 printed copy; $2.25 microfiche. Water-Resources Investigations 43-75, December 1975. 30 p, 6 fig, 4 tab, 15 ref.

Descriptors: *Cooling water, *Thermal powerplants, *Florida, Saline water, Freshwater, Evaluation, *Water utilization, Water demand, Water conservation, Consumptive use, Heat transfer, Energy dissipation, Cooling towers.
Identifiers: *Cooling ponds, Once-through cooling.

In 1970, cooling systems of powerplants in Florida consumed about 106 mgd of water, mostly saline; however, powerplants in Florida increasingly are being located inland where saline water is not available for cooling purposes. In Florida, a cooling pond for a 1,000 megawatt nuclear powerplant operating at full load in summer consumes about 12.5 mgd of water. A cooling tower for a plant of the same size consumes about 14.8 mgd. Once-through cooling systems require 5 to 10 percent less water than cooling ponds, but the total withdrawal of water for this method is so large that it is practicable in Florida only along the coast where saline water can be used. Water consumption for power production in Florida could increase to 400 mgd by 1990 and 800 mgd by 2000. Demand also will increase greatly for other uses that require fresh water. The continued use of saline water for cooling systems of powerplants would help to conserve the fresh-water supply for these other uses. (Woodard-USGS)

THE WATER AND TOTAL OPTIMIZATIONS OF WET AND DRY-WET COOLING TOWERS FOR ELECTRIC POWER PLANTS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
T. E. Croley, V. C. Patel, and M. S. Cheng.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 856, $9.75 in paper copy, $2.25 in microfiche. IIHR Report No. 163, January 1975. 298 p. 97 fig., 8 tab., 61 ref., 7 append. OWRT C-4071 (No. 9015)(1)

Descriptors: *Optimization, *Design, *Cooling towers, *Powerplants, *Cost-benefit analysis, Consumptive use, Model studies, Capital costs, Methodology, Operating costs, Computer models, Water conservation, Efficiencies.
Identifiers: *Dry-wet cooling towers, Wet cooling towers.

A detailed methodology for the assessment of thermodynamic and economic efficiency of combined dry-wet mechanical draft cooling towers for large electric power plants is developed. Operating costs are considered along with capital costs in the economic analysis. The application of the methodology is demonstrated for wet cooling

towers as well as three different configurations of combined dryswet towers. Results indicate that: (1) fuel and water costs play a major role in the determination of the optimum size of both types of cooling systems, (2) use of a combination of dry-wet towers saves a considerable amount of water and reduces fogging as compared to completely wet towers, (3) for many applications, combination towers are economically competitive or superior to conventional wet towers, (4) use of dry-wet towers gives additional flexibility to site selection, (5) the water conservation, fog abatement potential, and overall economics of dry-wet cooling towers all depend on the manner in which the dry and wet portions are combined. The models developed are not restricted to any particular cooling tower design, and may be optimized to constrain either fogging or water consumption as well as economic performance. 3F. Conservation In Agriculture

THE EFFECT OF IRRIGATION ON THE DEVELOPMENT OF DESERT TAKYR SOILS, (IN RUSSIAN),
M. K. Charyev.
Probl Osvoeniya Pustyn'. 6, p 11-15, 1973.

Descriptors: *Irrigation, Soils, *Crop production, Productivity, Deserts, *Sierozems, Arid lands, Fertilizers, Root system, Humus, Phosphorus, Nitrogen, *Soil physical properties, Application rates, Soil treatment.
Identifiers: *Takyr soils.

Productivity of takyr soils is improved by the efficient root system of the plants, irrigational sitting and application of fertilizers. The content of humus, P and N is increased and an increment of the developed horizon depth is observed. All these factors improve the hydrophysical properties of the soils.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF SOIL MOISTURE AFTER YOUNG PANICLE FORMATION STAGE ON MINERAL COMPOSITION IN LOWLAND BROWN RICE, (IN JAPANESE),
National Food Research Inst., Tokyo, (Japan).
H. Taira, H. Taira, and S. Inoue.
Proc Crop Sci Soc Jpn. 43(2), p 135-143, 1974.

Descriptors: *Soil moisture, *Rice, Crop production, Iron, Phosphorus, Potassium, Manganese, Magnesium, Growth stages.
Identifiers: Panicle formation, Brown rice, Soils(Mineral content).

The P, K, Mg, Mn and Fe content in rice were influenced by the soil moisture conditions. The P, K, Mg and Mn contents on dry matter basis decreased with decreasing soil moisture. With decreasing soil moisture, the P and Mg contents in ash decreased and the Fe content increased. The most affected component was Mg both on dry matter basis and in ash, followed by K on dry matter basis and Fe in ash.--Copyright 1975, Biological Abstracts, Inc.

WATER REQUIREMENT OF POTATO,
Uttar Pradesh Inst. of Agricultural Sciences, Kanpur (India).
S. C. Yadav, and B. R. Tripathi.
Indian J Agric Sci. 43(5), p 477-482, 1973.

Descriptors: *Potatoes, Field crops, Vegetable crops, *Irrigation effects, *Water requirements, Irrigation efficiency.
Identifiers: Solanum-Tuberosum L.

Irrigation of potato (Solanum tuberosum L.) at different moisture regimes had a significant effect on tuber yield. Under wet moisture regime the average yield was 352.76 q(quintals)/ha when compared with 300.15 q/ha under moist 263.79 q/ha under dry regimes. The average consumptive use of water was 285.79, 309.90 and 345.50 mm under dry, moist and wet regimes, respectively. The consumptive use decreased with the delay in irrigation. For the wet regime that produced the best yields the irrigation requirement was 404.10 mm in 1966-67 and 313-10 mm in 1967-68. In 1967-68 only 86.28 mm total rainfall was received during the crop season. The irrigation efficiency decreased with an increase in the frequency of irrigation. The water-use efficiency was not influenced by differential irrigation treatments. It was 1.0 q/ha mm of water used/ha in both years. Copyright 1974, Biological Abstracts, Inc.

ANALYSIS OF STRUCTURAL AND NONSTRUCTURAL FLOOD CONTROL MEASURES USING COMPUTER PROGRAM HEC-5C,
Hydrologic Engineering Center, Davis, Calif.
W. K. Johnson, and D. W. Davis.
Training Document No. 7, November 1975. 141 p, 16 fig, 9 tab, 6 ref, 1 append.

Descriptors: *Flood control, *Computer programs, *Flood plains, *Floods, Flood protection, Flood damage, Reservoirs, Channel improvement, Levees, Floodproofing, Diversion, Diversion structures, Warning systems, Flood forecasting, Relocation, Flood discharge, Hydrology, Hydraulics.

This training document illustrated how a variety of structural and nonstructural flood control measures can be analyzed using computer program HEC-5C, 'Simulation of Flood Control and Conservation System.' This document was divided into three parts. The first part discussed some basic principles of flood control planning; part II illustrated the application of many of the principles described in part I; and the third part (appendix) contained supportive computer output developed as part of the application in part II. RECONNAISSANCE OF THE WATER RESOURCES OF THE UPPER KLICKITAT RIVER BASIN, YAKIMA INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash.
D. R. Cline.
Open-file report 75-518, 1976. 54 p, 6 fig, 11 tab, 15 ref, append.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Indian reservations, *Washington, Hydrologic data, Water quality, *Streamflow, Springs, Water wells, Water yield, Water utilization, Irrigation.
Identifiers: *Yakima Indian Reservation(Wash), *Klickitat River basin(Wash).

The upper Klickitat River basin, covering 749 sq mi in the Yakima Indian Reservation, Wash., lies immediately east of the crest of the southern Cascade Range and is dominated on its western margin by 12,276-foot Mount Adams, a glacier-mantled volcano. The Klickitat River, which flows south to the Columbia River, discharges an annual flow of about 1,200 cfs at the point where it leaves the reservation; probably about 60 percent of this is groundwater discharge. Several streams provide irrigation water to about 5,600 acres in the Camas Prairie-Glenwood area. About 12,000 acre-ft of the water was delivered by Hellroaring Ditch in 1974. The area around Mount Adams yields considerably more water per square mile than the remainder of the basin because an average of 140 in of precipitation falls on the upper slopes of this mountain, mostly as snow. Less than 30 in falls in the southern part of the basin along the Klickitat River. Groundwater in large quantities (more than 400 cfs in the fall of 1974 and mostly from the Mount Adams area) discharges into the Klickitat River canyon in a 13-mile reach in the southern part of the reservation; about one-half of the water is discharged from large springs. The largest spring discharges about 40 cfs. (Woodard-USGS)

WATER RESOURCES OF PIERCE COUNTY, NEBRASKA,
Nebraska Univ., Lincoln. Conservation Co and Div.
R. E. Brogden, F. B. Shaffer, and R. A. Engberg.
Nebraska Water Survey Paper Number 41, February 1976. 35 p.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Nebraska, Water supply, Agriculture, Irrigation, Data collections, Climatic data, Soils, Geology, Water yield, Aquifers, Streams.
Identifiers: Pierce County(Nebr).

Pierce County, in northeastern Nebraska, has an area of 576 square miles. Its economy is based on agriculture. Because precipitation is so variable, greater use of the more dependable sources of water supply is essential for maximum stabilization of agricultural productivity. This report describes the county's climate, soils, and water-bearing rocks insofar as they affect the availability and usability of streamflow and groundwater. It evaluates both types of water supply in quantitative and qualitative terms. Irrigated crops, mostly corn, totaled 15,600 acres during 1955-70. Water for irrigation was pumped from streams at 52 locations and from 146 wells. The average yield of irrigated corn ranged from 50 to 101 bushels per acre. (Woodard-USGS)
W76-07598

WATER-RESOURCES RECONNAISSANCE OF ST. GEORGE ISLAND, PRIBILOF ISLANDS, ALASKA.
Geological Survey, Anchorage, Alaska.
G. S. Anderson.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-250 365/As $3.50 printed copy; $2.25 microfiche. Water-Resources Investigations 76-6, January 1976. 15 p, 4 fig, 2 tab, 2 ref.

Descriptors: *Water resources, *Surveys, *Alaska, *Surface waters, *Groundwater resources, Water quality, Water supply, Available water, Aquifer characteristics, Islands, Lakes, Potable water, Salinity.
Identifiers: St. George Island(Alaska).

A hydrologic reconnaissance of St. George Island, Pribilof Islands, Alaska, was made in May 1974 to determine the feasibility of locating a source of water containing less sodium chloride than the present supply. The existing wells are apparently either too deep relative to sea level or too close to the ocean; they may be pumping from a transition zone between the freshwater and saltwater bodies. Other than a few lakes on the island, surface-water availability is limited. However, the presence of several freshwater springs suggests that groundwater of good quality does exist on the island. The island is relatively narrow, the rate of recharge is low, and the rocks are permeable; it is therefore concluded that the freshwater lens is thin. Fresh groundwater should be obtainable near the center of the island. However, production wells should be designed so as to skim freshwater from near the top of the lens. (Woodard-USGS)
W76-07601

SURVEY OF IRRIGATION CANAL ECOLOGICAL PARAMETERS INFLUENCING AQUATIC WEED GROWTH,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
N. E. Otto.
Report No. REC-ERC-759, May 1975. 65 p. 11 fig., 22 tab., 52 ref., 2 append.

Descriptors: *Aquatic weed control, *Irrigation canals, Submerged plants, *Colorado, *California, *Washington, Water chemistry, Nitrogen, Iron, Dissolved solids, Algae, Limiting factors, Rooted aquatic plants.

Comprehensive studies of water chemistry, hydrosoils, light penetration, and biological populations were conducted in 11 irrigation canals in Colorado, California, and Washington in order to determine the ecological factors that promote submersed weed growth. The plants were dominantly pondweeds with numerous subdominant species. Filamentous green algae also commonly grow among the weeds but are seldom as dominant as they are on concrete-lined canals. The most significant differences between canals supporting weeds and those that did not were that those without weeds had 70% less available nitrate-nitrogen, 71% less total iron, and 40% less total dissolved solids. All other measured parameters were statistically similar. Small statistical differences occurred in waters that had greater amounts of calcium, magnesium, and anions other than nitrates but the variations between individual ions were small. Dissolved oxygen levels were found to be at saturation or greater. Free carbon dioxide was seldom found because of the greater alkalinity of the waters, which had pH levels of 7.4 to 8.1. The indications are that measurable increases of mineral nutrient input was the major factor in causing greater incidence of weed growth and should be considered wherever irrigation return flows and urban sewage effluents enter irrigation waters. (Auen-Wisconsin).

EFFECT OF FLOODING ON THE REGENERATION OF SIX TROPICAL GRASSES AFTER DEFOLIATION,
Department of Primary Industries, Brisbane (Australia). Soil Conservation Branch.
E. R. Anderson.
Queensl J Agric Anim Sci. 31(1), p 25-29, 1974.

Descriptors: *Grasses, Tropical regions, *Flooding, Mortality, Growth rates, Australia, Vegetation regrowth.
Identifiers: Biloela, Cenchrus-Ciliaris, *Cultivars, *Defoliation, Panicum-Coloratum, Panicum-Maximum, Tarewinnabar, Urochloa-Mosambicensis.

The effect of flooding immediately and 15 days after defoliation on the survival and growth of Panicum coloratum, P. maximum, Urochloa mosambicensis and 3 Cenchrus ciliaris cultivars ('Biloela,' 'Molopo' and 'Tarewinnabar') was studied in a pot experiment at Mackay, Queensland Australia. Floiding immediately after defoliation was more deleterious to plant survival and production than flooding 15 days later. P. coloratum had greater flood tolerance than the other grasses.--Copyright 1975, Biological Abstracts, Inc.
W76-07696

FLOOD PLAIN INFORMATION: CLINTON RIVER AND PAINT CREEK, OAKLAND COUNTY, MICHIGAN.
United States Lake Survey, Detroit, Mich.
Prepared for the Water Resources Commission, Michigan Department of Natural Resources, and the Oakland County Planning Commission. April 1973. 36 p, 11 fig, 17 plates, 6 tab.

Descriptors: *Floods, Flooding, *Flood profiles, *Flood stages, *Flood plains, Obstructions to flow, Non-structural alternatives, Flood flow, River forecasting, Flood forecasting, Historic floods, Flood data, Peak discharge, Flow duration, Rivers, Ice jams, Flood plain zoning, Channel improvement, *Michigan.
Identifiers: *Clinton River(MI), Paint Creek(MI), Pontiac(MI), Rochester(MI), Auburn Heights(MI), Intermediate Regional Flood, Standard Project Flood.

Most development along these streams is located in Pontiac, Rochester and Auburn Heights. Besides residences there is some industry and commerce, and considerable undeveloped land in the flood plains. Paint Creek with a drainage area of 71.8 sq mi joins Clinton River at Rochester. Clinton River drains 760 sq mi, 299 of which are below the study area's lower limits. Winter and spring floods result from heavy rains. In summer intense local thunderstorms can cause large floods. The April 1947 flood is the greatest known on the Clinton River, but adequate data concerning its severity is missing. The second largest flood in June 1968 had a recorded peak flow of 1,400 cubic ft/sec at Auburn Heights. On Paint Creek at Rochester the highest recorded flood in February 1968, with a peak flow of 918 cfs, resulted from combined heavy snowmelt and rainfall. In an Intermediate Regional Flood a peak discharge of 6,100 cfs can be expected on Clinton River at Oakland-Macomb County line with 2,355 cfs expected on Paint Creek at its confluence with Clinton River. Channel velocities for Clinton River may range from 6 to 11 ft/sec. This flood would peak in 14 hours and last 12 hours above bankfull. In a Standard Project Flood peak discharges of 25,000 and 10,950 cfs are predicted on Clinton River and Paint Creek, respectively. Channel velocities in Clinton River could range up to 16.7 ft/sec with 3 ft/sec in the overbank area. This flood would peak in 21 hours and last 72 hours. Many bridges would obstruct flood flow. Pontiac has spent millions to Clinton River channel within the city limits and has adopted subdivision ordinances restricting building adjoining open drains and streams. (Smith-North Carolina)
W76-07720

FLOOD PLAIN INFORMATION: NORTH YUBA AND DOWNIE RIVERS, DOWNIEVILLE, CALIFORNIA.
Army Engineer District, Sacramento, Calif.
Prepared for Sierra County, California, January 1975. 29 p, 15 fig, 17 plates, 8 tab.

Descriptors: *Floods, Flooding, *Flood forecasting, Overflow, Streamflow forecasting, Maximum probable flood, *Flood profiles, Cloudbursts, Historic floods, Flood data, Flood frequency, Flood stages, *Peak discharge, Flood peak, Flow duration, Flood damage, Deposition(Sediments), Flood plains, Obstructions to flow, Building codes, *California.
Identifiers: Donnieville(CA), *North Yuba River(CA), *Downie River(CA), Standard Project Flood, Intermediate Regional Flood, Pauley Creek(CA).

The study area comprises the flood plains and immediately adjoining areas along North Yuba River between Goodyears Bar and the mouth of Slate Castle Creek (about 6 miles) and the Downie River from its mouth upstream to the mouth of Pauley Creek (1 mile). Lumbering, recreation, retail trade and Sierra County government are important to the economy. Except for downtown Downieville, development is very light. The approximate drainage area of the streams is 245 square miles. General rainfloods resulting from prolonged heavy rain over the tributary area and characterized by high peak flows of moderate duration can occur in the study area anytime from November through March. The largest flood on record occurred in 1963 when 19 inches of rain was deposited in the upper Yuba River Basin. Peak discharge on the North Yuba River at lower end of study area was 40,000 cfs. Damage included the destruction of homes and commercial properties, roads, bridges and domestic water supply facilities. In an Intermediate Regional Flood it is predicted that peak flows of 50,000 cfs will be reached with water velocities ranging from 10 to 25 ft/sec in the main channel and up to 10 ft/sec in the overbank area. It is anticipated that flood peak will be reached in about 5 hours and with duration above flood stage of 9 hours. In a Standard Project Flood a peak discharge of 66,000 cfs is predicted with time of rise around 6 hours and the duration above flood stage about 14 hours. Two of the five bridges in the study area are considered obstructive to major floods. To date there are no existing or authorized Federal flood control structures that would reduce flood damage. (Smith-North Carolina)
W76-07721

FLOOD PLAIN INFORMATION: ROCK RIVER-POPLAR CREEK, LUVERNE AND VICINITY, MINNESOTA.
Army Engineer District, Omaha, Nebr.
Prepared for the City of Luverne, Rock County and the State of Minnesota. June 1972. 43 p, 17 fig, 6 plates, 8 tab.

Descriptors: *Floods, *Flood flow, *River flow, *Flood profiles, *Peak discharge, *Flood plains, Obstructions to flow, Flooding, Regional flood, Streamflow forecasting, Historic floods, Flood data, Ice jams, Tributaries, Land use, *Minnesota.
Identifiers: *Rock River(MN), Poplar Creek(MN), Luverne(MN), Standard Project Flood, Intermediate Regional Flood.

The flood plain in this study area contains residential, commercial, industrial and agricultural developments which have been severely damaged by floods. Further urban expansion could worsen such damage. Poplar Creek which drains less than 3 sq mi is a tributary of Rock River, a tributary of the Missouri River, with a drainage area of 430 sq mi at Luverne. Major floods occur mainly in spring, with the highest flood occuring in 1969 when a peak discharge of 19,500 cubic feet per second was recorded. Snowmelt combined with rainfall is usually the cause of flooding. Since 1882, 6 floods of significant size have occurred. A flood in 1914 caused damaged estimated at $200,000. In past floods bridges have been washed out, thousands of turkeys have been killed, and many areas of the city of Luverne have been flooded. Floods rise to peak flow in 5 to 8 hours on the river with high velocities in the channel. In an Intermediate Regional Flood a peak discharge of 26,200 cfs on Rock River, and 2250 cfs on Poplar Creek are expected along with water velocities up to 5.6 ft/sec in the channel and up to 4.5 ft/sec in overbank areas. Most of 17 briges in the area would be obstructive to flow. This flood would rise to peak in 5 hours and last 12 hours above critical stage. In a Standard Project Flood a peak discharge of 64,800 cfs and 6290 cfs are expected on Rock River and at the mouth of Poplar Creek respectively, with bridges being even more obstructive. This flood would reach peak in 8 hours and last 25 hours. A dam upstream has no flood control capacity, and there are no other flood control structures in the study area. (Smith-North Carolina)
W76-07722

FLOOD PLAIN INFORMATION: KETTLE CREEK, WAYCROSS AND WARE COUNTY, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for Waycross and Ware County, Georgia, July 1971. 46 p, 23 fig, 21 plates, 15 tab.

Descriptors: *Floods, *Flood profiles, *Flood plains, Flow characteristics, *Flow duration, *Flood damage, Hurricanes, Historic floods, Flood frequency, Flood stages, Peak discharge, Channels, Warning systems, Channel improvement, *Georgia.

Identifiers: Waycross(GA), Ware County(GA), Kettle Creek(GA), Satilla River(GA), Intermediate Regional Flood, Standard Project Flood.

With a drainage area of 32 sq mi at its mouth, Kettle Creek has its headwaters in Cluffs Bay, southwest of Waycross, and flows in a northerly direction to its confluence with the Satilla River, north of Waycross. Streams in the study area, including 3 short tributaries, slope at an average rate of 5 feet/mile, flowing through a rapidly urbanizing area. Extensive commercial, industrial, and residential development exists in the flood plains. Channel dredging and maintenance have kept Kettle Creek in a well defined channel in the more developed areas. Twelve bridges and/or culverts, debris, shrubbery, and sand deposits can obstruct flood flows. In September 1964 Hurricane Dora dumped 7.03 inches of rain on Ware County and caused extensive damage to buildings and streets in Waycross. Installation of a gaging station at Cherokee Avenue in 1966 provides data on floods on Kettle Creek. The Intermediate Regional Flood is characterized by an estimated peak discharge of 3,505 cubic feet per second, at Cherokee Avenue, channel velocities of 8 ft/sec, and overbank velocities of 2 ft/sec. The IRF can be expected to rise 15 feet in 8 hours and remain above bankfull for 18 hours; 20 buildings and 750 acres would be flooded. The Standard Project Flood would have a peak discharge of 8,764 cfs and channel and overbank velocities of 13 and 3 ft/sec respectively. SPF would flood 56 buildings and 1370 acres. It would rise 16 feet in 12 hours and remain above bankfull for 24 hours. (Henley-North Carolina)
W76-07723

FLOOD PLAIN INFORMATION: HURRICANE CREEK, ALMA AND BACON COUNTY, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for the City of Alma and Bacon County, Georgia, May 1971. 35 p, 8 fig, 28 plates, 14 tab.

Descriptors: *Floods, *Flood plains, Channels, *Flood profiles, *Flood forecasting, *Flood stages, Hurricanes, Historic floods, Flood data, Peak discharge, Flow duration, Flow characteristics, Flood damage, Warning systems, *Georgia.
Identifiers: Hurricane Creek(GA), Bacon County(GA), Alma(GA), Jeff Davis County(GA), Standard Project Flood, Intermediate Regional Flood.

The flood situation in the City of Alma and Bacon County, Georgia, along Hurricane Creek from about two miles downstream of the Highway 32 bridge to County Highway S608, a distance of about 9 miles, plus portions of two tributary streams along this reach of the Creek is examined. Hurricane Creek (drainage area 170 sq mi) slopes at an average of 2.8 ft/mi in the study area and flows through Alma in 3 or 4 poorly defined channels averaging 45 feet in width and 2 feet in depth. Tributary streams have channels averaging 10 feet wide and 3 feet deep. Except for several large subdivisions built in recent years near the flood plains between Highways 32 and 1, there is only scattered development in or near the flood plains. Shrubs, debris, sand and silt deposits, 5 bridges and culverts can obstruct flood flows during the Intermediate Regional Flood. Flows have exceeded bankful 28 times since 1951 with a maximum discharge of 4,450 cubic feet per second occurring in September 1953 when Hurricane Florence dumped 9.08 inches of rain on the study area in six days. Hurricane Creek rose 5.5 feet in 8.4 hours and remained above bankful for 6 days. Peak discharge during IRF and the Standard Project Flood would reach 12,500 and 31,400 cfs respectively. The IRF would rise 11 feet in 96 hours and would remain above bankfull for 8 days. Eleven structures and 2,100 acres would be flooded. Channel and overbank velocities would reach 4.6 and 2.1 ft/sec respectively. The SPF would typically rise 19 feet in 120 hours and remain above bankfull for 10 days, inundating 26 structures and 2,500 acres. (Henley-North Carolina)
W76-07724

FLOOD PLAIN INFORMATION: LITTLE CRAB ORCHARD CREEK AND PILES FORK CREEK, CARBONDALE, ILLINOIS.
Army Engineer District, St. Louis, Mo.
Prepared for Carbondale, Illinois, July 1970. 58 p, 15 fig, 16 plates, 12 tab.

Descriptors: *Floods, Flooding, *Flood profiles, *Flood plains, Streamflow forecasting, Historic floods, Peak discharge, Flood peak, Flow duration, Reservoirs, Channel improvements, *Illinois.
Identifiers: Little Crab Orchard Creek(IL), Piles Fork Creek(IL), Carbondale(IL), *Standard Project Flood, *Intermediate Regional Flood, Big Muddy River(IL), Glades Creek(IL).

Carbondale lies between the watersheds of Little Crab Creek and Piles Fork with the northeast section of the city subject to flooding due to the low, flat terrain and the poor and inadequate drainage system. Only small amounts of commercial and residential development are on the flood plains, but the land is suitable to more development. Most floods occur in spring and summer and result from heavy rains. There are no stream gage records for these streams. The 1933 flood on Little Crab Orchard Creek was the biggest in memory and on Pile Fork the 1969 flood was quite substantial. In 1961 flooding in the lower reaches of both creeks occurred when water backed up from Big Muddy River. During an Intermediate Regional Flood peak discharges of 2000 cfs and 1600 cfs are expected on Little Crab Orchard Creek and Piles Fork respectively, and water velocities of 7 ft/sec in the channel and 2 to 3 ft/sec in the overbank. The flood would rise in about 10 hours and remain 14 to 16 hours above floodstage. In a Standard Project Flood a peak discharge of 3600 cfs on Little Crab Orchard Creek and 2700 cfs on Piles Fork is expected, with water velocities of 9 ft/sec in the channels and 3 ft/sec in overbank areas. Flood peak would be reached in 22 hours and waters would remain above floodstage from 23 to 24 hours. The five bridges and culverts of Little Crab orchard Creek would cause some obstruction to flow in major floods, as would the 14 bridges or culverts and one pipeline bridge across Piles Fork. Some channel improvement has been done on both creeks and more is expected. On Piles Fork there is the Carbondale Reservoir which was built for water supply and has a fixed spillway. (Smith-North Carolina)

FLOOD INSURANCE STUDY: PLEASANTON, ALAMEDA COUNTY, CALIFORNIA, (PRELIMINARY REPORT),
Army Engineer District, San Francisco, Calif.
Prepared for the Federal Insurance Administration, May 1972. 7 p, 13 plates, 2 tab.

Descriptors: *Floods, *Flood profiles, *Flood peak, *Flood plains, *Flood plain insurance, Flooding, Streamflow forecasting, Dams, Channel improvement, *California.
Identifiers: Pleasanton(CA), *Pleasanton Canal(CA), Alameda County(CA), Arroyo Mocho(CA), Tassajara Creek(CA), *Flood insurance, Chabot Canal(CA), Del Valle Dam(CA).

The City of Pleasanton is a residential community of 22,250 situated in the Amador Valley of Central Alameda County. A portion of Pleasanton's developed area is situated at the low point of the valley floor which is an historical flood plain fed by a number of natural streams. The contributing drainage area is 405 square miles. Data for this report was synthesized from basin characteristics as no stream flow gage is installed in the study area. Allowance has been made for channel improvements and construction of Del Valle Dam located 7 miles southwest of the city. The study area is divided into 4 zones. Zone A would be subject to a 100 year flood; Zone B would be subject to a Standard Project Flood; Zone C is not subject to flooding; and Zone D must be studied further. Flood profiles included show the 100 year flood, a Standard Project Flood, and a 10 year flood. Floodways were developed for all areas considered and included sections of Arroyo de la Laguna, Arroyo Mocho, and Chabot Canal. Areas not considered but which appear to qualify for floodway analysis are the Pleasanton Canal, Tassajara Creek and another section of the Arroyo Mocho. Floodway computations were based on conditions assuming the floodway fringe was filled or otherwise blocked and that the floodway area was unobstructed. It was designed to pass the 100 year storm with approximately 1 foot rise. Velocities in the floodway fringe are expected to be 1 to 2 ft/sec. Future study by the City would likely revise this floodway. (Smith-North Carolina)
W76-07726

FLOOD PLAIN INFORMATION: MINNESOTA RIVER AND TRIBUTARIES, MANKATO, NORTH MANKATO, LE HILLIER.
Army Engineer District, St. Paul, Minn.
Prepared for Mankato, North Mankato, and Le Hillier, Minnesota. October 1973. 43 p, 35 fig, 19 plates, 5 tab.

Descriptors: *Floods, *Flood profiles, *Peak discharge, Flood peak, *Flood plains, Tributaries, *Flood protection, Flooding, Flood flow, Streamflow forecasting, River forecasting, Storms, Historic floods, Flow duration, Rivers, Floodways, Obstructions to flow, Flood plain zoning, Levee, Dikes, Reservoirs, Erosion control, Channel improvement, *Minnesota.
Identifiers: *Minnesota River(MN), Mankato(MN), Le Hillier(MN), North Mankato(MN), *Blue Earth River(MN), Standard Project Flood, Intermediate Regional Flood.

Four major floods in the last 22 years have caused heavy damages in the flood plains along the streams of this study, principally in Mankato, a city of 150,000 people. The Blue Earth River, with a drainage area of 3550 sq mi, is a tributary of the Minnesota River which drains 14,900 sq mi above Mankato. Storms most often occur in the spring when rivers can be fed by heavy snowmelt and rains, though in summer rainstorms of short duration and high intensity are common. The maximum spring flood occurred in 1965 when a peak discharge of 94,100 cubic ft/sec was reached. The highest summer flood, in 1908, had a peak discharge of 54,500 cfs. Dikes have been constructed prior to some floods and are generally removed after danger of flooding passes. It is possible to build these temporary structures because of the warnings which are given on snowmelt conditions. In an Intermediate Regional Flood a peak discharge of 105,000 cfs is predicted on the Minnesota River. This flood would rise in 6 days to peak and last 18 days at critical stage. The Standard Project Flood would have a peak discharge of 155,000 cfs. It would rise to peak in 11 days and last 20 days. A considerable portion of built-up areas would be subject to flooding from either flood. Aside from levees which have been constructed from time to time, a Federal Flood Control Project is now being constructed. Phase 1 consists of flood barriers with supporting interior drainage facilities to protect the entire flood prone areas in the three cities. It will provide protection against a flood of the 1965 height. Phase 2 would be a series of upstream reservoirs to provide protection against even larger floods. (Smith-North Carolina)
W76-07727

FLOOD PLAIN INFORMATION: GRAND RIVER, GRAND RAPIDS, MICHIGAN AND VICINITY.
United States Lake Survey, Detroit, Mich.

Prepared for Water Resources Commission, Michigan Department of Natural Resources, and Grand River Watershed Council. 1972. 39 p, 23 fig, 14 plates, 6 tab.

Descriptors: *Floods, *Flood profiles, *Flood stages, *Flood plains, Flooding, Flood flow, Streamflow forecasting, Historic floods, Flood data, Peak discharge, Rivers, Levee, Floodwalls, *Michigan.
Identifiers: *Grand River(MI), Grand Rapids(MI), Standard Project Flood, Intermediate Regional Flood.

The Grand River flood plain at Grand Rapids is highly developed and pressure is great to continue development of industrial, business and residential areas. The Grand River is fed by 6 major and numerous minor tributaries including the Rogue, Flat, Maple, Thornapple, Lookingglass, and Red Cedar Rivers with drainage areas of 255, 550, 970, 875, 290, and 402 sq mi, respectively. Only the Rogue joins the Grand River within the study limits. The Grand River has a drainage of 5063 sq mi above the lower limit of the study area and drains into Lake Michigan. Its relatively flat gradients increase the risk of floods which are usually caused by winter and spring rains coupled with snowmelt. The largest flood occurred in 1904 when a peak discharge of 54,000 cubic ft/sec was recorded and flooding reached disastrous proportions. The largest recent flood was in 1948 with a peak discharge of 42,200 cfs with the flood level 2.5 feet less than the 1904 flood. In an Intermediate Regional Flood a peak discharge of 61,000 cfs is expected with water velocities of 7.4 ft/sec in the main channel and 1.2 ft/sec in the overbank area. This flood would rise from critical stage to peak in 44 hours and last 98 hours above critical stage. During a Standard Project Flood a peak discharge of 151,000 cfs is expected with water velocities up to 9 ft/sec in the channel and 1.4 ft/sec in the overbank area. This flood would rise in 64 hours and remain 153 hours. In addition to obstruction caused by bridges in large floods there are four low dams across the river which obstruct flood flow somewhat. Floodwalls and levees, built after the 1904 flood, have helped protect Grand Rapids, but increase flood stages upstream. (Smith-North Carolina)
W76-07728

FLOOD PLAIN INFORMATION: MISSISSIPPI RIVER-SAUK RIVER-WATAB RIVER, VICINITY OF ST. CLOUD, MINNESOTA.
Army Engineer District, St. Paul, Minn.
Prepared for St. Cloud Metropolitan Area Planning Commission, September 1974. 23 p, 12 fig, 13 plates, 6 tab.

Descriptors: *Floods, *Flood profiles, Rivers, Flood plains, Tributaries, *Mississippi River, Floodwater, Flooding, River forecasting, Historic floods, Flood data, Peak discharge, Flow duration, Ice jams, Obstructions to flow, *Minnesota.
Identifiers: *Sauk River(MN), *Watab River(MN), St. Cloud(MN), Sartell(MN), Sauk Rapids(MN), Intermediate Regional Flood, Standard Project Flood.

Properties along banks of the 3 rivers vary in their state of development. Along the Mississippi steep banks have discouraged development, though there are some residences and commercial development in St. Cloud and Sartell. Along the Sauk heavily wooded sections have forced building to occur in open flood plain areas with more development expected. Along the Watab development is mostly beyond the flood plain. The Watab, which drains 85 sq mi, and the Sauk, with a drainage area of 970 sq mi, are tributaries of the Mississippi with a total drainage of 13,320 sq mi in or above this study area. Floods generally occur in spring though they can occur at anytime. Conditions which lead to flooding are frozen saturated ground, rapid snowmelt, and rain. In an Intermediate Regional Flood peak discharges of 57,500 cubic ft/sec on the Mississippi, 10,300 cfs on the Sauk and 1880 cfs on the Watab are predicted with water velocities ranging from 4 to 12 ft/sec. This flood would rise in about 11 days to flood peak and last 30 days. Most of the 14 bridges and culverts crossing the area streams are obstructive to this flood. Ice jams at bridges can cause backup and deepening of flood waters. During a Standard Project Flood peak discharges of 100,000 cfs, 20,300 cfs, and 5,000 cfs are predicted on the Mississippi, Sauk, and Watab Rivers respectively. This flood would rise to peak in 30 days and last about 50 days. Damage in either major flood could be extensive. Reservoirs at the Mississippi headwaters, built in the late 19th century, provide little protection from floods, and there are no existing flood ordinances to prevent building in flood prone areas. (Smith-North Carolina)
W76-07729

FLOOD PLAIN INFORMATION: YALOBUSHA RIVER AND TRIBUTARIES, GRENADA, MISSISSIPPI.
Army Engineer District, Vicksburg, Miss.
Prepared for the City of Grenada, and Grenada County, Mississippi. March 1972. 41 p, 18 fig, 21 plates, 8 tab.

Descriptors: *Floods, Flooding, *Flood profiles, Frail lands, *Flood plains, Dams, Regional flood, *Flood flow, Streamflow forecasting, Flood data, Flood waves, Flow duration, Bank erosion, Water storage, Channel improvement, *Mississippi.
Identifiers: *Yalobusha River(MS), Grenada(MS), Riverdale Creek(MS), *Grenada Lake project(MS), Perry Creek(MS), Batupan Bogue(MS), Grenada Dam(MS).

In and near the city of Grenada there has been some flood plain encroachment, mostly in the low lying areas near Batupan Bogue. Grenada is bounded by Perry Creek and Batupan Bogue to the east and south. Riverdale Creek enters Yalobusha River a short distance north of Grenada. Yalobusha River drains a total of 2050 square miles, 1320 sq mi of this above Grenada Dam which does much to protect the city. Batupan Bogue, the major tributary of Yalobusha River and the cause of most of the flood in the area, is undergoing adjustment in its stability and meanders through a bank carving process which is working upstream. Before completion of the Grenada Lake project in 1954, the largest flood occurred in 1948 with a peak discharge of 78,900 cubic feet/sec. A 1961 flood had a discharge of 50,000 cfs. An Intermediate Regional Flood could be caused by rain amounting to 6 inches in 6 hours and 9 inches in 24 hours. On Yalobusha River crest would be 2.4 ft higher than the 1961 flood and 1.5 ft on Batapan Bogue. A Standard Project Flood could result from rains varying from 9.7 inches in 6 hours to a total of 18.1 inches in 48 hours. It would be 6.1 feet higher than the 1961 flood with channel velocities of 18 ft/sec on Batupan Bogue and 11 ft/sec in Yalobusha River with velocities of 3 ft/sec in overbank areas. Heavy growth in some channels retards streamflow. Aside from the dam, few flood damage prevention measures have been undertaken, though the channel of Yalobusha River has been improved. (Smith-North Carolina)
W76-07730

FLOOD PLAIN INFORMATION: CEDAR CREEK, ATHENS AND CLARKE COUNTY, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for Athens and Clarke County, Georgia, June 1969. 34 p, 8 fig., 13 plates, 13 tab.

Descriptors: *Floods, *Flood stages, *Flash floods, *Flood profiles, Historic floods, Flood data, Peak discharge, Flood duration, Flow characteristics, Flood damage, *Bank erosion, *Flood damages, Flood forecasting, *Georgia.
Identifiers: *Cedar Creek(Ga), Clarke County(Ga), Athens(Ga), Intermediate Regional Flood, Standard project flood, Oconee River(Ga).

The study limits of Cedar Creek on the eastern outskirts of Athens are from its confluence with the Oconee River to its headwaters, a distance of about 6 miles. Tributary A which enters just above Old Lexington Road and Tributary B which enters 0.5 miles upstream are included. Average slope of the creek is about 37 ft/mile with a flood plain ranging in width from 100 to 300 ft. The upper reaches of Cedar Creek drain developed residential areas close to Tributary A. New development below Old Lexington Road is built high on valley slopes. Expansion of Athens is expected to increase pressure for building in the flood plain. The most severe flood in recent years occurred in May 1966. Over 9 inches of rain fell in a 5 hour period. Flash floods damaged homes and business establishments in the Athens area. Streets and culverts were heavily damaged. Bank erosion was severe along Cedar Creek. Using statistical studies of nearby streams the Intermediate Regional Flood and the Standard Project Flood are expected to have peak discharges of 3,620 and 10,800 cubic feet per second, respectively. The IRF would rise 13 feet in 9 hours and remain above bankfull for 16 hours, flooding 8 buildings and 135 acres. Channel and overbank velocities would reach 11 and 3 ft/sec., respectively. SPF would inundate 15 buildings and 160 acres and would rise 19 ft. in 12 hours and remain above bankful for 22 hours. Channel and overbank velocities would reach 15 and 5 ft/sec., respectively. The Standard Project Storm could produce 19.9 inches of rain in 96 hours. (Henley-North Carolina)
W76-07731

FLOOD PLAIN INFORMATION: FRESNO RIVER AND COTTONWOOD, LITTLE DRY, AND ROOT CREEKS, MADERA, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Madera County, CA, June 1973. 54 p, 27 fig, 38 plates, 9 tab.

Descriptors: Flooding, *Flash floods, *Flood profiles, *Flood plains, Non-structural alternatives, Streamflow forecasting, Cloudbursts, Flood data, Flood frequency, Flood damage, Erosion, Deposition, Flood plain zoning, Flood plain insurance, Zoning, Levee, Dams, Channel improvement, Obstructions to flow, Floodways, *California.
Identifiers: *Fresno River(Ca), Cottonwood Creek(Ca), Little Dry Creek(Ca), Root Creek(Ca), Madera(Ca), *Hidden Lake(Ca), Intermediate regional flood, Standard project flood.

Flood records of this study area show that damaging floods have occurred in 11 of the last 35 years. Lands are used primarily for irrigated crops, orchards, vineyards and grazing of cattle. Residential, commercial and manufacturing zones are present in Madera and the community is expanding into agricultural areas. The streams in the study area drain about 400 square miles. Floods in the past have resulted from prolonged rain, generally in late spring to early fall, but also in winter. Cloudbursts storms can result in high peak flows, with short floodflow duration, greater than those of general flood-producing storms. Two stream gages have been in operation since 1915 and 1941. The largest floods on record occurred in 1955 and 1969 with peak flows of 17,500 and 17,300 cubic feet per second, respectively. In the 1969 flood residential damage was $535,000. Hidden Lake, is scheduled to be completed on the Fresno River in 1975. It will serve as a multipurpose flood control, including a dam. In the Intermediate Regional Flood peak flows of up to 34,000 cfs can be expected without the dam and velocities of 4 to 8 feet per second. With the dam flows of 5000 cfs and velocities of 3 to 5 feet per second are forecast. A Standard Project Flood without the dam would result in flows of up to 49,000 cfs, and with the dam, flows of 21,000 cfs may be expected. Numerous bridges and culverts would be obstructions to flow in a Standard Project Flood without the dam in place, but with the dam these problems are reduced considerably. Madera Coun-

ty is adopting a flood plain ordinance and does have general zoning applicable to stream channels and river bottoms. (Smith-North Carolina)
W76-07732

FLOOD PLAIN INFORMATION: MILL SLOUGH, OSCEOLA AND ORANGE COUNTIES, FLORIDA.
Army Engineer District, Jacksonville, Fla.
Prepared for the Board of County Commissioners of Osceola County, June 1973. 37 p, 18 fig, 8 plates, 5 tab.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Flood damage, Flow characteristics, Warning systems, Control structures, Channels, Flow duration, Peak discharge, Flood stages, Flood data, Storms, Hurricanes, Runoff, *Florida.
Identifiers: Osceola County(FL), Kissimmee(FL), *Mill Slough(FL), Lake Tohopekaliga(FL), North City Ditch(FL), County Canal(FL), Orange County(FL), Intermediate Regional Flood, Standard Project Flood.

Located in Osceola County, Florida, (population 25,267) Mill Slough drains an area of about 14 sq mi and flows southerly from its origin in a swampy area for about 4 miles, discharging into Lake Tohopekaliga. Floods on Mill Slough are controlled to some extent by the water level of Lake Tohopekaliga which is regulated by the Central and Southern Florida Flood Control District. North City Ditch and County Canal, constructed by the City of Kissimmee to intercept runoff which flows from the northern drainage basin of Mill Slough and direct the flow around Kissimmee, do not prevent flooding. Flood plains in the upper reaches of Mill Slough are sparsely developed agricultural lands. The lower reaches in and near Kissimmee have flood plains well developed with commercial, residential, and light industrial uses. Vegetation and bridges can obstruct flood flows. Major floods have occurred during various seasons of the year; the greatest recorded flood occurring in October 1956 when 16.28 inches of rain fell in a 24 hour period. Damages were estimated at $1 million. Flood flows can rise to extreme flood peak in a short time. The Intermediate Regional Flood and the Standard Project Flood would have peak discharges of 1,500 and 2,000 cubic feet per second at the mouth of Mill Slough. The IRF would have overbank velocities of up to 6 ft/sec and channel velocities of 3-7 ft/sec and flood 360 developed acres and 540 structures. The IRF would typically have maximum rate of rise of 0.3 ft/hour and have a duration of critical stage of 41 hours. The SPF would flood 900 structures and 640 acres of built up area. It would rise at 0.4 ft/hour and remain at critical stage for 55 hours. (Henley-North Carolina)
W76-07733

FLOOD PLAIN INFORMATION: BIG THOMPSON RIVER, LOVELAND, COLORADO.
Army Engineer District, Omaha, Nebr.
Prepared for Loveland, December 1971. 21 p, 9 plates, 2 tab.

Descriptors: *Flood plains, *Floods, *Peak discharge, *Flood profiles, Channels, Snowmelt, Flood flow, Flood data, Historic floods, Flood stages, Flow duration, Flow characteristics, Erosion, *Colorado.
Identifiers: *Big Thompson River(Co), Larimer County(Co), Loveland(Co), Buckhorn Creek(Co), Fall River(Co), Glacier Creek(Co), South Platte River(Co), Intermediate Regional Flood, Standard project flood.

Big Thompson River flows easterly from the mountains of the Colorado Front Range to join South Platte River southwest of Greeley, Colorado. That portion studied in this report extends from the eastern edge of the foothills to a point 8 miles downstream. Flowing through the city of Loveland (population 16,220) in Larimer County, this portion of Big Thompson River drains an area of 509 sq mi and has an average slope of 19 ft/mi. The channel is from 4 to 10 ft deep and from 50 to 200 ft wide. Flood plain development includes agriculture, gravel mining operations, commercial facilities, and a few residential acreages. Future growth in Loveland and Larimer County is expected to force further flood plain development. Elevated roadways and irrigation diversion structures will obstruct floodflows. The cause of floods is usually intense rainfall in the late spring and summer with the possibility of rainfall runoff being increased by snowmelt in May and June. The largest known flood occurred in August 1951 with an estimated peak discharge of 22,000 cubic feet per second at Loveland. This flood resulted in four deaths and $602,000 damage to homes, crops, and highways. The Intermediate Regional Flood and the Standard Project Flood will have peak discharges of 19,000 and 44,000 cfs, respectively. Overbank velocities during IRF will be 1.5-3.5 ft/sec. Erosion will be the major source of future flood damage. (Henley-North Carolina)

FLOOD PLAIN INFORMATION: NORTH FORK REPUBLICAN RIVER, WRAY, COLORADO.
Army Engineer District, Kansas City, Mo.
Prepared for the Colorado Water Conservation Board, June 1969. 29 p, 14 fig, 8 plates, 4 tab.

Descriptors: *Floods, *Flood profiles, Control structures, *Cloudbursts, *Flood plains, *Flash floods, Velocity, Flood flow, Peak discharge, Flood data, Historic floods, Flow duration, Channels, Dams, Reservoirs, Channel improvement, Levee, *Colorado.
Identifiers: *North Fork Republican River(Co), Wray(Co), Yuma County(Co), Chief Creek(Co), Intermediate regional flood, Standard project flood(Co).

Flood hazards along an 11 mile reach of the North Fork Republican River in the vicinity of Wray are evaluated. Although the total drainage area on the west edge of Wray is 1,216 square miles, only 59 sq. mi. actually contribute to surface runoff. Topographical barriers existing on the northern and southern edges of Wray have forced development expansion into the flood plain which has an average slope of 10 ft/mile and width of one-quarter mile. In 1934, Wray, a marketing center of 2,082 for the surrounding farming area, attempted to improve some of the bottom area for commercial development by straightening the river channel, building a levee, a diversion dam and a millrace. Business establishments are now located on both sides of the channel. Railroad tracks are also in the flood plain. Obstructions to floodflows include 10 bridges, highways, and railroads. Flooding from sidehill runoff in the town has been relieved since 1961 when the Soil Conservation Service completed a watershed treatment project which included six retarding dams. Flooding normally results from summer cloudbursts and is characterized by a very fast rate of rise and short durations. The Intermediate Regional Flood and the Standard Project Flood would have peak discharges of 4,200 and 11,700 cubic feet per second respectively, inundating the business area, railroad tracks and parts of U.S. Highway 34 and 385. Velocities vary markedly in the study reach. For an IRF channel velocities range from 2.59 to 6.89 ft/sec, overbank velocities from 0.93 to 2.33 ft/sec. Channel velocities for the SPF range from 3.63 to 7.95 ft/sec, overbank from 1.51 to 2.63 ft/sec. (Henley - North Carolina)

FLOOD ESTIMATION FROM SHORT RECORDS,
Queensland Irrigation and Water Supply Commission, Brisbane (Australia).
W. C. Boughton.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY3, Proceedings Paper 11996, p 241-253, March 1976. 5 fig, 7 tab, 9 ref.

Descriptors: *Flood forecasting, *Peak discharge, *Floods, Flood frequency, Hydraulics, Hydrology, Rainfall, Forecasting, Estimating, Watersheds(Basins), Streamflow, *Australia.
Identifiers: *Flood estimation, Short records, Queensland(Australia).

Peak flood flows are highly correlated with the daily flows in which they occurred, and this relationship was used to develop a method of extending short flood records. The frequency distribution of daily flows, estimated from daily rainfalls by a rainfall-runoff model, was used with the short flood record to estimate the long-term distribution of floods. Tests were made on 8 catchments, 67 sq mi to 505 sq mi in area in Queensland, Australia, using 10 years of streamflow record in each case with daily rainfalls to estimate 30 to 35 years of floods. Log-normal and Log-Pearson III distributions were fitted to both estimated and actual flood series. The estimated 1-in-50 year and 1-in-100 year floods differed on average by less than 8% from the actual records. (Roberts-ISWS)
W76-07771

APPLICATIONS OF REMOTE SENSING TO WATERSHED MANAGEMENT,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
A. Rango.
Available from the National Technical Information Service, Springfield, Va 22161, as N75 24072, $3.50 in paper copy, $2.25 in microfiche. NASA TM X-70896, April 1975. 15 p, 5 fig, 1 tab, 30 ref.

Descriptors: *Remote sensing, *Watershed management, *Water resources, Aerial photography, Satellites(Artificial), Aircraft, Floods, Floodplains, Snow cover, Runoff forecasting, Runoff, Land use, Watersheds(Basins), Physiographic provinces, Surface waters.

Present aircraft and satellite remote sensing systems (operational and experimental) are capable of contributing greatly to watershed management, primarily in the areas of snow mapping, surface water inventories, flood management, hydrologic land use monitoring, and watershed modeling. The two most widely applicable remote sensors are the Multispectral Scanner Subsystem on LANDSAT and the basic multispectral camera array flown on high altitude aircraft such as the U-2. Other aspects of watershed management will be investigated with future aircraft and spacecraft systems possessing higher resolutions and/or covering different spectral wavelength bands such as microwaves. The development of techniques for assessing soil moisture from remote sensing observations would provide a significant

breakthrough in hydrology. As the technological advances in remote sensing of hydrological data continue to accelerate, so must the watershed management community expand its awareness of and its training in remote sensing techniques if these new tools are to be put to optimum use. (Sims-ISWS)

THE WATER SUPPLY OF ROME,
College of Physicians of Philadelphia, Pa.
H. J. Abrahams.
Journal of American Water Works Association, Vol. 67, No. 12, p. 663-68 (1975). 6 p, 2 fig, 1 photo, 3 tab, 1 ref.

Descriptors: *History, *Water supply, *Water distribution(Applied), *Water management(Applied), *Water resources development, Water supply development, Water control, Water conveyance, Water sources, Surface water availability, Supply, Resources development, Piping systems(Mechanical), Pipelines, Pipe flow, Surface waters.
Identifiers: *Rome(Italy), Tiber River.

As ancient Rome began to grow in importance and size the demand for water increased beyond what could be taken from the Tiber River. Thus aqueducts were built to bring water into the city from the surrounding hills and streams. The water supply was propelled into the city by gravity but only one ninth of the aqueducts were upon arches. An aqueduct would discharge into a delivery tank in the city at its own elevation. The water was then conveyed by lead pipes to water basins and public buildings. Repairs upon the aqueducts generally took place in the fall and spring. Such repairs were usually greatly needed inasmuch as one half of the aqueducts' water often failed to arrive in Rome. The quality of the water arriving in the city was governed by many factors. Some aqueducts brought much purer waters into Rome than others. The quantity and quality of Rome's water supply depended greatly upon the quality of the water commissioners who guided construction and allotment of the water supply. The water delivery system stands as one of Rome's finest contributions to public health. (Welch-Florida)

SYNTHETIC MONTHLY RUN-OFF RECORDS FOR UNGAUGED BRITISH CATCHMENTS,
Northumbrian River Authority, Gosforth (England).
B. M. J. Barton.
Journal of the Institution of Water Engineers, Vol. 27, No. 3, p 149-162, May, 1973. 3 fig, 3 tab. 12 ref.

Descriptors: *Model studies, *Runoff, Computer programs, Topography, Soil types, Geology, Gaging, Snow, Rainfall-runoff relationships, Data collections.
Identifiers: Catchment records.

A technique whereby a synthetic record of monthly runoff may be generated for any British catchment, gaged or ungaged, has been developed. The technique involves the simultaneous stochastic generation from readily available data of monthly values of catchment precipitation, potential transpiration, and snowlag, which are then routed through a simple deterministic catchment model to yield the corresponding synthetic record of monthly runoff. Numerical values of the model parameters are obtained from a correlation with the topography, geology, and soil type of the catchment under investigation. The technique is intended primarily for use with high-speed electronic computers. A computer program incorporating both deterministic model and stochastic data generation procedures is used, enabling a semi-infinite synthetic catchment runoff record to be obtained. (Sandoski-FIRL)

SURFACE-WATER RESOURCES OF THE TANGIPAHOA, TCHEFUNCTA, AND NATALBANY RIVER BASINS, SOUTHEASTERN LOUISIANA,
Geological Survey, Baton Rouge, La.
L. D. Fayard, and D. J. Nyman.
Louisiana Department of Public Works, Baton Rouge, Water Resources Technical Report No 11, 1976. 49 p, 12 fig, 6 plates, 5 tab, 26 ref.

Descriptors: *Water resources, *Surface waters, *Water quality, *Hydrologic data, *Louisiana, Streamflow, Water yield, Base flow, Low flow, Inflow, Groundwater movement, Chemical analysis, Data collections, Available water.
Identifiers: *Tangipahoa River basin(La), *Tchefuncta River basin(La), *Natalbany River basin(La).

The Tangipahoa, Tchefuncta, and Natalbany River basins are in southeastern Louisiana, north of Lakes Maurepas and Pontchartrain. The combined average flow of the rivers is about 1,400 cfs, or 900 mgd. Rivers in the Tangipahoa and Tchefuncta basins have very good connection with the shallow aquifers and, therefore, have high sustained yields during periods of base flow. The lowest flow recorded in Tangipahoa River at Robert (1938-74) was 245 cfs, which is equivalent to a basin yield of 0.38 cubic foot per second per square mile of drainage area. The lowest flow recorded in Tchefuncta River near Folsom (1943-74) was 26 cfs, equivalent to 0.27 cubic foot per second per square mile. The quality of the water in both rivers is good, and dissolved solids are generally less than 50 mg/litre. These two rivers are good potential sources for municipal and industrial water supplies. Fecal coliform bacteria in undesirable amounts (greater than 200 colonies per 100 milliliters) have been detected in the two rivers, indicating periodic pollution by bacterial wastes. Streams in the Natalbany basin are poorly connected to the shallow aquifer. A 1-day low flow of 1.8 cfs (1943-74), equivalent to 0.023 cubic foot per second per square mile of drainage area was recorded at Baptist. Large withdrawals from these streams would not be feasible because of the large amount of storage that would be required. The water is slightly more mineralized than water from the other basins but is generally of good quality. (Woodard-USGS)

STUDIES ON THE OPERATION OF GOBIND-SAGAR RESERVOIR,
Regional Engineering Coll., Kurukshetra (India).
N. N. Pillai, and G. S. Sodhi.
Indian Journal of Power and River Valley Development, Vol. XXV, No. 1, p 19-28, January 1975. 2 fig, 3 tab, 9 ref.

Descriptors: *Reservoir operation, *Irrigation, *Power, *Water supply, Hydrologic data, Reser-

voir storage, Reservoir releases, Farmers, Industries, *Risks.
Identifiers: *Gobindsagar reservoir(India), Depletion period.

Bhakra Nangal Project has irrigation and power generation as the main objectives. Water released for irrigation is utilized in generation of power also. But since the irrigation requirements vary considerably and in some years there has developed acute shortage of water in the reservoir, drastic power cuts are imposed affecting the consumers adversely. It is suggested that the releases from Gobindsagar reservoir may be made so that the shortages are distributed throughout the depletion period. Based on the reservoir elevation reached at any time and the inflows expected in future, a graphical procedure is developed to calculate reservoir factors at the beginning of each tenday period. This procedure will insure high firm power with the constraints of irrigation requirements. Also, early information can be given to the farmers and industrialists concerning the probable amount of water release and power generation in order to avoid uncertain risks. (Bell-Cornell)

Descriptors: *Reservoir storage, *Linear programming, *Hydroelectric power, *Comprehensive planning, Optimization, Regulation, Discharge(Water), Operations research, Simulation analysis, Computer programs, Streamflow, Costs, Constraints, Equations, Mathematical models, Systems analysis, Canada, Screening.
Identifiers: Allocation.

A linear programming technique is used as an aid in selecting storage reservoirs for a hydroelectric power development system at the feasibility stage of investigation, and for maximizing system guaranteed hydroelectric power by optimum regulation of discharge through power plants and from diversions for a selected time period. The linear programming technique is used as an allocation or screening model that provides information on system operation and response which would be useful in the preliminary design of hydroelectric power producing facilities and from which basic data and guidelines could be extracted for extending the investigation to the study of long-term system response by use of simulation models. The linear programming model has proved effective as a screening or allocation tool in the first phase of a modeling study conducted on one possible system for developing hydropower on the Albany River in Northern Ontario. The model lends itself to the type of application described, particularly if constraint and production functions can be linearized without introducing major complications in determining the matrix coefficients or large inaccuracies in the solutions. Identifiers: *India, *Developing countries, Food production, National water links, Economic restraints, Technical restraints.

River basin development leads to the development of the useful land regions of the world. The characteristics of river basins vary greatly from one another. In India, there are 14 major river basins, each exceeding 20,000 sq. km.; three of these are Himalayan rivers and the rest Peninsular rivers. There are 44 medium river basins and numerous rivers with smaller catchments. Major river basins constitute 83% of the geographical area of the country. This paper considers the planning needs for the major rivers in India. Three rivers, the Indus, the Ganga, and the Brahmaputra account for more than 50% of the total drainage area of the major rivers. Due to their size, it will be necessary to treat each important tributary of these large rivers as a subbasin on its own merits. Thus, the number of subbasins to be considered in the Indus, the Ganga, and the Brahmaputra will total up to about 140. It will be desirable to divide the basins into regions of approximately 10,000 sq. km., each bounded by tributary rivers, in order to accomplish a detailed assessment of water needs and planning. Identifiers: *Greece, *Yugoslavia, *Vardar/Axios River basin.

This paper is concerned with the implementation of an on-going project of the United Nations Development Programme in which the United Nations is assisting the Governments of Greece and Yugoslavia to prepare a phased program for the regulation and utilization of the water resources of a common river basin. It traces the history of the project and describes the characteristics of the basin. Details are given of the institutional framework under which the work is being undertaken, the progress of the studies to date, the future inputs of the United Nations, and the means being employed to insure coordination of the works at the project level. SIZING FLOOD CONTROL RESERVOIR SYSTEMS BY SYSTEMS ANALYSIS,
Hydrologic Engineering Center, Davis, Calif.
B. Eichert, and D. Davis.
Technical Paper No. 44, March 1976. 32 p, 1 fig, 3 tab.

Descriptors: *Flood control, *Reservoirs, *Size, *Computer programs, Systems analysis, Simulation analysis, Planning, Operation and maintenance, Reservoir storage, Costs, Hydrology, Economics, Effects, Mathematical models.
Identifiers: Sensitivity analysis.

This paper focuses upon reservoirs as flood control measures. Planning flood control reservoir systems requires analysis of basin-wide hydrology, individual reservoir and system operation, and system performance in reducing intensity of flooding. Sizing reservoir systems includes the major tasks of selecting system components from among competing alternatives and determining the flood control storage within each reservoir. Due to the large number of alternative systems possible in complex river basins and because of the complexity of evaluating each system, it is essential that a reasonably structured system formulation strategy be adopted as the framework for analysis. Application of a practical flood control reservoir system simulation model that yields detailed system operation of all components and summarizes hydrologic and economic performance and costs greatly assists in determining system performance. To perform the simulation, the model accepts data on (1) historical or synthetic flood hydrology, (2) reservoir system storage and operating criteria, (3) reservoir costs, and (4) damage potential at system control points. Discussed is the scope of reservoir system formulation, modeling flood control systems, criteria and strategies for system formulation; the concepts are illustrated with applications in recent systems studies. (Bell-Cornell)

STORM DRAINAGE AND URBAN REGION FLOOD CONTROL PLANNING,
Hydrologic Engineering Center, Davis, Calif.
D. Davis.
Technical Paper No. 40, October 1974. 44 ref.

Descriptors: *Storm water, *Management, *Storm drains, *Planning, *Flood control, Urban hydrology, Rainfall-runoff relationships, Urbanization, Effects, Watersheds(Basins), Analytical techniques, Performance, Design storm, Costs, Flood plains.
Identifiers: Alternatives, Public participation.

Stormwater management systems are expensive and have performed well in some instances and poorly in others. The investment in storm drains is three times the investment in works to protect the flood plain, and the annual damages from inadequate storm drains may well exceed the damage inflicted upon urban flood plains. Storm drainage systems are a major planning task because of the large variety of management alternatives that are possible and because the impact of works on communities can be very great. Competition for space and funds and good planning require that drainage systems be considered integral parts of a broader urban design and that advantage be taken of all feasible joint development opportunities. In addition, there is growing concern that many problems should be amenable to nonstructural solutions that do not necessarily require large scale disturbance of the landscape. This paper (1) defines the subject area and describes its characteristics, (2) reviews past concepts in storm

drainage, (3) describes the current context of planning these systems (4) describes the alternatives available and the implementation requirements, and (5) discusses institutional factors including the federal interest, and concludes with some observations on current planning approaches. PLANNING FOR THE REHABILITATION OF GRAVEL PITS,
Waterloo University, Ontario, Canada, School of Urban and Regional Planning.
G. Mulamoottil, and R. Farvolden.
Water Resources Bulletin, Vol. 11, No. 3, p 599-604, June 1975. 2 fig, 5 ref.

Descriptors: *Planning, *Recreation, *Lakes, Surface waters, Groundwater, Soils, Land use, Topography, Canada.
Identifiers: *Gravel pits, *Urban areas.

By field investigations and planning, it is profitable to rehabilitate gravel pits as recreational lakes in urban areas. Some of the important aspects to be considered are topography, soil, surface water and groundwater. A case study is presented and some general guidelines in the rehabilitation process are given. This kind of a use for derelict land is important at the present time as there is a growing demand for recreational lakes in urban areas. (Bell-Cornell)

OPTIMAL SIZING OF URBAN FLOOD CONTROL SYSTEMS,
Hydrologic Engineering Center, Davis, Calif.
D. W. Davis.
Technical Paper No. 42, March 1974. 16 p, 5 fig, 1 tab, 9 ref.

Descriptors: *Flood control, *Water resources, *Simulation analysis, *Computer models, *Urbanization, Planning, Hydrology, Size, *Optimization, Methodology, Drainage, Costs, Reservoirs, Storage, Pumping plants, Diversion, Rainfall-runoff relationships, Equations, Mathematical models, Systems analysis.
Identifiers: Economic analysis, Benefit maximization, Social costs, Minimization, Automatic search procedure, Univariate gradient procedure, Newton-Raphson convergence procedure, Systems engineering.

Optimal sizes for components of urban flood-control systems can be determined from a detailed simulation analysis controlled by an optimization methodology. Flood-control measures within urban areas frequently consist of complex systems of detention storage reservoirs, channel modifications, levees, land-use controls, flood proofing, and pumping facilities. The optimal size of each of these system components depends on the system interaction with other components and the hydrologic, economic, environmental, and other performance outputs of the system. A technique has been developed and programmed for an existing simulation model that automatically determines the sizes of urban flood-control components of detention storage, flow diversions, and pumping plants, the objective being to maximize system net benefits subject to accomplishment of hydrologic performance targets and to minimize social costs. The system is simulated using hydrologic data, component cost and performance functions, and flow damage information at damage centers. Utilized also are an automatic search procedure--the univariate gradient procedure--and the Newton-Raphson convergence procedure. (Bell-Cornell)

A SIMULATION MODEL FOR OPERATING A MULTIPURPOSE MULTIRESERVOIR SYSTEM,
Acres Consulting Services Ltd., Niagara Falls (Ontario).
O. T. Sigvaldason.
Water Resources Research, Vol. 12, No. 2, p 263-278, April 1976. 8 fig, 3 tab, 40 ref.

Descriptors: *Multiple-purpose reservoirs, *Reservoir operation, *Simulation analysis, *Optimum development plans, Water policy, Assessment, River basins, Reservoir storage, Networks, Equations, Mathematical models, Systems analysis, *Canada.
Identifiers: *Trent River basin(Ontario Canada), Out-of-kilter algorithms.

Described is a simulation model used for assessing alternative operating policies for the Trent River system in Ontario, Canada. The Trent basin has numerous reservoirs (48 were represented in the model). The reservoir system is used for flood control, water supply, hydropower, and augmenting flows through the canal system during the summer period. The need for assessing alternative policies arose from growing conflicts in recent years over satisfying all of the many water-based needs of the basin. The simulation model aided in assessing the impact of alternative policies. Every reservoir was subdivided into five storage zones (variable temporally). A time-based rule curve was prescribed to represent ideal reservoir operation. Ranges were prescribed for channel flows, which were dependent on water-based needs. The underlying concept of the model was the mathematical representation of the chief operator's perception of 'optimum' operation and the derivation of this solution using a nested optimization submodel. 'Penalty coefficients' were assigned to those variables which represented deviations from ideal conditions. Different operational policies were simulated by representing the entire reservoir system in 'capacitated network' form and deriving optimum solutions for individual time periods with the 'out-of-kilter' algorithm. The algorithm was computationally efficient, simplified model development, and permitted flexibility in readily using the model for a wide range of reservoir configurations and operating policies. ANNUAL WATER-RESOURCES REVIEW, WHITE SANDS MISSILE RANGE, 1975--A BASIC-DATA REPORT,
Geological Survey, Albuquerque, N. Mex.
R. R. Cruz.
Open-file report, March 1976. 39 p, 9 fig, 5 tab, 2 ref.

Descriptors: *Water wells, *Withdrawal, *Water level fluctuations, *Water quality, *New Mexico, Military reservations, Water supply, Basic data collections, Hydrology, Drawdown, Groundwater recharge, Chemical analysis, Aquifers.
Identifiers: *White Sands Missile Range (N Mex).

This report presents water-resources information that was collected at White Sands Missile Range, N. Mex., during 1975 by personnel of the U.S. Geological Survey. Data on groundwater pumpage and resulting water-level fluctuation, chemical quality, and precipitation are summarized. The data are part of the continuing water-resources basic-data collection program sponsored by the Facilities Engineering Directorate, White Sands Missile Range. Groundwater pumpage totaled 714,580,000 gallons (preliminary figures) at the Post Headquarters well field in 1975. This was 42,646,000 gallons less than pumpage in 1974. Water-levels declined in six of the nine supply wells in the Post Headquarters well field during the period of December 1974 to December 1975. The declines ranged from 21.00 feet to less than one foot. The annual total rainfall was 9.12 inches, which is 1.61 inches below the yearly average. There was no significant change in water quality for samples collected during 1975 compared with 1974 samples. (Woodard-USGS)

Descriptors: *Groundwater resources, *Water quality, *Aquifer characteristics, *Hydrogeology, *North Dakota, Hydrologic data, Water yield, Water utilization, Maps, Water wells, Water level fluctuations, Chemical properties, Available water, Geology.
Identifiers: Hettinger County(N Dak), Stark County(N Dak).

The sedimentary rocks of Paleozoic, Mesozoic, and Cenozoic age in Hettinger and Stark Counties, N. Dak., on the south-central flank of the Williston structural basin, are about 14,000 feet thick. They are gently folded into north-plunging anticlines and synclines. The Fox Hills and basal Hell Creek aquifer system underlies the entire area at depths greater than 1,100 feet. The water in this system is a sodium bicarbonate type with a dissolved-solids concentration of 1,310 to 1,540 mg/litre. The upper Hell Creek and lower Cannonball-Ludlow aquifer system underlies all of Hettinger and Stark Counties. The water contains a sodium bicarbonate type with a dissolved-solids concentration ranging from 1,450 to 1,890 mg/litre. Water in the basal sandstone member is generally a sodium bicarbonate type with a dissolved-solids concentration ranging from 704 to 1,470 mg/litre. The Sentinel Butte aquifer system underlies most of Stark County. The water is generally of a sodium sulfate type. Dissolved-solids concentration of the samples ranged from 378 to 11,700 mg/litre. Approximately 6,800 acre-ft of water was obtained from groundwater and surface-water sources in 1969. Groundwater sources furnished about 40 percent of the total water supply. (Woodard-USGS)

ARTIFICIAL RECHARGE THROUGH A WELL IN FISSURED CARBONATE ROCK, WEST ST. PAUL, MINNESOTA,
Geological Survey, St. Paul, Minn.
H. O. Reeder, W. W. Wood, G. G. Ehrlich, and R. J. Sun.
Available from Supt. of Documents, GPO, Wash., D.C. 20402, price $1.65. Water-Supply Paper 2004, 1976. 80 p, 28 fig, 16 tab, 55 ref.

Descriptors: *Artificial recharge, *Injection wells, *Aquifer characteristics, *Aquifer testing, *Minnesota, Carbonate rocks, Methodology, Observation wells, Feasibility studies, Groundwater recharge, Underground storage, Hydrogeology, Water yield, Water level fluctuations, Groundwater movement, Tracking techniques.
Identifiers: *West St. Paul(Minn), Prairie du Chien Group, Jordan Sandstone.

Tests were made near St. Paul, Minn., to determine the feasibility of artificially recharging a consolidated aquifer by well injection. The formations of primary concern at the recharge experiment site are the Prairie du Chien Group and the underlying Jordan Sandstone, which is the major aquifer in the area. The Prairie du Chien is made up primarily of well-fractured dolomite, which contains solution openings. The Jordan Sandstone is more uniform and is considered to be homogeneous on a large scale, although small fractures and variations in material are recognized locally. The two layers are hydraulically interconnected and are artesian. A head difference of 2 ft is noted between water levels in a well open only in the dolomite and in a nearby well open only in the sandstone. For the tests, a production well was installed in the Prairie du Chien Group, and observation wells were installed nearby, both in the Prairie du Chien and in the Jordan Sandstone. Pumping tests were performed before and after injection, and the injection test itself involved recharge of 2,754,000 gallons occurring at a rate of about 100 gpm for 20 days. Air entrainment during injection was avoided by use of a small-diameter pipe, in which pipe friction was sufficient to maintain positive pressure throughout the column. The injection test demonstrated that it is hydrologically feasible to recharge the Prairie du Chien Group and the Jordan Sandstone artificially through wells completed in the Prairie du Chien Group. GEOHYDROLOGIC RECONNAISSANCE OF THE IMPERIAL VALLEY, CALIFORNIA,
Geological Survey, Reston, Va.
O. J. Loeltz, B. Irelan, J. H. Robison, and F. H. Olmsted.
Available from Superintendent of Documents, Government Printing Office, Washington, D. C., 20402, $2.85 in paper copy. Professional Paper 486-K, 1975. 54 p, 12 fig, 2 plates, 5 tab, 53 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Well data, *Water quality, *Deserts, California, Projecting, Water demand, Irrigation, Data collections, Hydrogeology, Groundwater potential, Chemical analysis.
Identifiers: *Imperial Valley(Calif).

The Imperial Valley in southern California is the largest desert irrigation development in the United States. Half a million acres of otherwise parched desert lands have been transformed into one of the most productive agricultural areas in the Nation by the importation of Colorado River water. Recognizing that the ever increasing demands for Colorado River water might exceed the available supply, the objectives of this report on Imperial Valley were (1) to describe the geology in relation to the occurrence of groundwater, (2) to define the hydraulic characteristics (transmissivity and storage) of the aquifers, (3) to determine the sources of groundwater, (4) to determine the direction of movement of groundwater, (5) to determine the principal means by which groundwater is discharged, (6) to determine the chemical quality of the groundwater in various parts of the system, and (7) to relate differences in chemical composition of the water to differences in the sources of recharge and to man-caused and natural processes. More than 300 wells were inventoried. (Woodard-USGS)

AVAILABILITY OF GROUND WATER FOR IRRIGATION ON THE KEKAHAMANA COASTAL PLAIN, ISLAND OF KAUAI, HAWAII,
Geological Survey, Honolulu, Hawaii.
R. J. Burt.
Hawaii Division of Water and Land Development, Honolulu, Report R-53, January 1976. 79 p, 14 fig, 3 tab, 13 ref.

Descriptors: *Groundwater resources, *Irrigation, *Sugarcane, *Hawaii, *Hydrologic data, Hydrogeology, Irrigation wells, Aquifer characteristics, Withdrawal, Water yield, Artesian heads, Drawdown, Saline water intrusion, Sea water, Groundwater recharge, Evaluation.
Identifiers: *Kauai(Hawaii).

The Kekaha-Mana coastal plain on the southwest side of the island of Kauai, Hawaii is underlain by a basaltic aquifer from which individual wells or shafts yield as much as 22 mgd. The basaltic aquifer is recharged in a highland area adjacent to the plain and is overlain by about 200 feet of poorly permeable sedimentary formations that retard natural discharge, creating artesian conditions. Pumpage from wells and shafts tapping the basaltic aquifer for irrigation of sugarcane began in the early 1900's. This development of groundwater has been accompanied by an increasing chloride content of water from the basalt, reflecting seawater intrusion as artesian heads declined. Average pumpage for 1958-68 was about 24 mgd (27,000 acre-ft annually); pumpage in both 1972 and 1973 was about 73 mgd (82,000 acre-ft), tripling the former average. At this rate, pumpage exceeds recharge by tens of thousands of acre-feet each year. (Woodard-USGS)

RECORDS OF WELLS, SPRINGS, AND STREAMS IN THE POTOMAC RIVER BASIN, WEST VIRGINIA,
Geological Survey, Morgantown, W. Va.
E. A. Friel, W. A. Hobba, Jr., and J. L. Chisholm.
West Virginia Geological and Economic Survey, (Morgantown), Basic Data Report No 3, 1975. 96 p, 3 fig, 10 tab.

Descriptors: *Hydrologic data, *Potomac River, *West Virginia, *Water resources, *Water quality, River basins, Streamflow, Flow rates, Gaging stations, Basic data collections, Surface waters, Groundwater, Aquifer characteristics, Well data, Drillers logs, Water analysis, Chemical analysis, Pesticides.
Identifiers: *Potomac River Basin(W Va).

This basic data report was compiled from water-resources studies of the Potomac River basin in West Virginia. Most of the basic data were obtained during the period 1968-1971. The study is a part of the continuing investigation of the water resources of the river basins of West Virginia by the U. S. Geological Survey, conducted in cooperation with the West Virginia Geological and Economic Survey and the West Virginia Department of Natural Resouces, Division of Water Resources. Other included data are from the files of the U. S. Geological Survey or from previously published reports. The 10 tables of data include: (1) records of wells and springs, (2) chemical analyses of groundwater, (3) chemical analyses of surface water, (4) field chemical analyses of surface water at stream-gaging stations, (5) low-flow measurements and field chemical analyses of selected streams and springs, (6) daily specific conductance and discharge of Dillions Run at Capon Bridge, (7) pesticide analyses of groundwater, (8) standard summaries of streamflow data, (9) discharge measurements at partial-record and miscellaneous sites, and (10) selected drillers' logs. HYDRAULIC EFFECTS OF CHANGES IN BOTTOM-LAND VEGETATION ON THREE MAJOR FLOODS, GILA RIVER IN SOUTHEASTERN ARIZONA,
Geological Survey, Sacramento.
D. E. Burkham.
Available from Supt. of Documents, GPO, Wash., DC 20402, price $2.05. Professional Paper 655-J, 1976. 14 p, 2 fig, 2 plates, 2 tab, 12 ref.

Descriptors: *Vegetation effects, *Floods, *Runoff, *Arizona, Streamflow, Hydrologic data, Flow rates, Depth, Channel morphology, Peak discharge, Roughness coefficient, Water yield, Evaluation.
Identifiers: *Gila River(Ariz).

Changes in bottom-land vegetation between December 1965 and October 1972 caused significant differences in stage, mean cross-sectional velocity, mean cross-sectional depth, and boundary roughness at peak discharges of three major floods in an 11.5-mile study reach of the Gila River in southeastern Arizona. The first flood, which had a peak flow of 39,000 cfs, occurred in December 1965 when the dense bottom-land vegetation was dormant. The second flood, which had a peak discharge of 40,000 cfs, occurred in August 1967 when the vegetation had large amounts of foliage; however, the vegetation had been eradicated in the upstream half of the study reach prior to this flood. The third flood, which had a peak discharge of 80,000 cfs, occurred in October 1972; the vegetation had been eradicated in the whole study reach prior to this flood. Compared to the 1965 flood, the large amounts of foliage in the uncleared half of the reach during the 1967 flood apparently caused a 7 percent decrease in mean velocity, a 6 percent increase in mean depth, and an 11 percent increase in the Manning roughness coefficient at peak stage. Compared to the 1965 flood the clearing of the study reach apparently caused a 25 percent increase in mean velocity, a 15 percent decrease in mean depth, and a 30 percent decrease in the Manning roughness coefficient at peak stage in the 1967 and 1972 floods. Available from the National Technical Information Service, Springfield, Va., 22161, as N75 17767, $4.00 in paper copy, $2.25 in microfiche. NASA TM X-70827, January 1975. 28 p, 1 fig, 3 tab, 7 ref.

Descriptors: Watershed management, *Remote sensing, *Satellites(Artificial), *Watersheds(Basins), *Drainage area, Physiographic provinces, Drainage patterns(Geologic), Drainage, Geomorphology, Geology, Land use, Drainage density, Runoff, Runoff forecasting, Water resources.
Identifiers: *ERTS.

ERTS-1 satellite imagery has been evaluated as a means of providing useful watershed physiography information. From these data, physiographic parameters (such as drainage basin area and shape, drainage density, stream length and sinuosity, and the percentage of a watershed occupied by major land use types) were obtained in three study areas: (1) southwestern Wisconsin, (2) eastern Colorado, and (3) portions of the Middle Atlantic States. Using ERTS-1 imagery at 1:250,000 and 1:100,000 scales, it was found that drainage basin area and shape and stream sinuosity were comparable (within 10%) in all study areas to physiographic measurements derived from conventional topographic maps at the same scales. Land use information can be usefully extracted for watersheds as small as 30 sq mi. Improved drainage network and density information was obtained from ERTS-1 imagery in dissected areas such as southwestern Wisconsin, but in heavily vegetated areas (Middle Atlantic States) or areas with little physical relief (Eastern Colorado) low order streams are difficult to detect and the derived drainage densities are significantly smaller than those obtainable from standard maps. It was concluded that ERTS-1 imagery can be employed to advantage in mean annual runoff prediction techniques and in providing or maintaining land use information used in the calibration and operation of watershed models. Available from the National Technical Information Service, Springfield, Va., 22161, as N75

24067, $3.50 in paper copy, $2.25 in microfiche. NASA TM X-70888, November 1973. 43 p, 9 fig, 16 tab, 19 ref.

Descriptors: *Remote sensing, *Runoff, *Silting, Aerial photography, Satellites(Artificial), Environment, Environmental effects, Soils, Water pollution, Urbanization, Construction, Land use, Watersheds(Basins), Drainage, Sedimentation, Erosion, Storms, Geology.
Identifiers: *ERTS, *Anacostia basin.

An analysis has been made of the effects of urbanization and highway construction on run-off, erosion and siltation on the Anacostia watershed. The analysis was based on changes in land use patterns as determined from aerial photographs as well as geologic and hydrologic data for the region. Two selected subwatersheds of Indian Creek and one of Little Paint Branch of the Northeast Branch of the Anacostia were studied in terms of three hypothetical storms of different magnitudes. It was determined that an approximately 10% increase in impervious surface could bring about a 12% increase in the peak discharge for storms of the magnitude of tropical storm Agnes, a 20% increase in peak discharge for 10 hours storm and as much as a 150% increase in peak discharge for a typical thunderstorm. Also the early hourly incremental discharge from a storm of Agnes' magnitude could be increased by as much as 100%. Correspondingly large effects were observed in soil erosion and siltation from bare construction sites which show sediment yields of up to hundreds of thousands of tons per square mile per year. The effects of rapid run-off, erosion and siltation are interrelated with other environmental problems such as sewage, oil and chemical pollution and lack of adequate public transportation. The net result is one of a steady degradation of the urban and suburban environment and of the estuary and bay into which this river flows. (Sims-ISWS)

ENVIRONMENTAL MONITORING THROUGH THE USE OF EXPOSURE PANELS,
William F. Clapp Labs., Inc., Duxbury, Mass.
R. E. Hillman.
In: Fisheries and Energy Production: A Symposium, p 55-76, 1975, 5 fig, 6 tab, 33 ref.

Descriptors: *Monitoring, *Equipment, Algae, Annelids, Populations, Water quality.
Identifiers: *Exposure panels, Millstone Point, New Haven Harbor, Stamford Harbor.

Exposure panels were made of white pine with a transite facing. Monitoring sites in Long Island Sound were at Millstone Point, New Haven Harbor, and Stamford Harbor. Species diversity indexes for algal and annelid populations as they occurred on the panels were calculated for the period from 1968 to 1973. Increases in diversity indexes over time indicated possible changes in water quality. Far more species were found on the Millstone Point panels although the number of phyla found on the panels exposed at all three sites were not significantly different. O. V. Meshkova, and V. N. Dmitriyeva.
Zovodskaya Laboratoriya, Vol. 40, No. 1, p 28-29, 1974.

Descriptors: *Pollutant identification, *Chemical wastes, *Waste water(pollution), Electrodes, Analytical techniques, *Polarographic analysis, Separation techniques, Industrial wastes.
Identifiers: Styrene, Methylmetacrylate.

A method for the extraction and polarographic determination of styrene and methylmetacrylate in waste waters generated in plastic scintillator production is presented. Extraction was done by means of benzene used in such a quantity that the final ratio of waste water to extract amounted to 1:20. Prior to the polarographic determination, the extract was diluted with 0.05 N-solution of styrene or methylmetacrylate in 95 percent dimethylformamide. Polarographic determination was done in an electric polarograph with a mercury drop electrode against standard solutions. Quantitative determination was performed by means of calibration curve. PITTSBURGH RAINWATER ANALYSIS BY PIXE,
Pittsburgh Univ., Pa.
K. C. Chan, B. L. Cohen, J. O. Frohliger, and L. Shabason.
Tellus, Vol. 28, No. 1, p 25-30, 1976. 5 fig, 2 tab, 13 ref.

Descriptors: *Rain water, Chemistry of precipitation, *Heavy metals, Sampling, Water chemistry, Chemical analysis, Water pollution, Air pollution, *Pollutant identification, Pollutants, Fallout, *X-ray analysis, X-ray fluorescence, X-ray spectroscopy, X-rays, Analytical techniques, On-site data collections, Meteorology, *Pennsylvania.
Identifiers: *Pittsburgh(Penn).

Concentrations of thirteen elements in rainwater from the Pittsburgh, Pennsylvania, area were analyzed by Charged Particle Induced X-ray Emission (PIXE). They were compared to rainwater in a rural area and air particulates in Pittsburgh. Local and non-local contributions were discussed. Washout ratios were calculated and found to be larger for smaller size particles, contrary to general belief. This work demonstrated the convenience of using PIXE. (Sims - ISWS)

REFERENCE GUIDE TO METHODOLOGY FOR THE ANALYSIS OF ORGANIC COMPOUNDS.
Geological Survey, Bay St. Louis, Miss.
R. A. Baker, and M. L. Yates.
Open-file report, December 1975. 136 p.

Descriptors: *Pollutant identification, *Water analysis, *Organic compounds, *Methodology, *Analytical techniques, Sampling, Waste water(pollution), Pesticides, Oil, Phenols, Oxygen demand, Detergents, Physical properties, Chemical properties, Industrial wastes, *Water quality standards.
Identifiers: *Water analysis reference guide, Sample preparation, Sample preservation.

This compilation of organic-related analytical techniques was initiated to assist the methods development group of the central laboratories of the U.S. Geological Survey. Details of the procedures are not included. Instead, the compilation summarizes methodology currently employed in research and field studies. Although some methods have been published and standardized, others are unknown beyond the laboratory in which they were developed. The objective is to document these techniques and thus reduce the possibility of repeating developments or of using less effective methods. The literature reference and (or) the individual (laboratory) contact are indicated rather than the analytical detail. The user of this compilation is expected to examine the reference or contact the appropriate individual if the method is unpublished. Hopefully this will facilitate response of the central laboratories to the needs of district (field) personnel. (Woodard-USGS)

CHEMICAL CHARACTERISTICS OF THE LOWER KISSIMMEE RIVER, FLORIDA--WITH EMPHASIS ON NITROGEN AND PHOSPHORUS,
Geological Survey, Tallahassee, Fla.
A. G. Lamonds.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-250-938, $6.00 printed copy; $2.25 microfiche. Water-Resources Investigations 45-75, November 1975. 133 p, 22 fig, 39 tab, 17 ref.

Descriptors: *Water quality, *Florida, *Surface waters, *Chemical properties, *Biological properties, Chemical analysis, Data collections, Nitrogen, Phosphorus, River basins, Impoundments, Stratification, Reservoir releases, Streamflow, Ion transport.
Identifiers: *Lower Kissimmee River(Fla).

The impoundments in the lower Kissimmee River in Florida contained calcium bicarbonate water with an average dissolved solids concentrtion less than 160 mg/l. Concentrations of dissolved solids and phosphorus increased and nitrogen decreased downstream. During warm weather the impoundments were often stratified and water near the bottom often contained very little dissolved oxygen but relatively high concentrations of ammonia nitrogen and phosphorus. During stratifications, bottom releases from these impoundments often resulted in higher concentrations of ammonia nitrogen and phosphorus below the structures than above them. From July 1971 through June 1972 the Kissimmee River carried 268,000 tons of dissolved solids, including 2,330 tons of nitrogen and 135 tons of phosphorus into Lake Okeechobee. The lower part of the basin (below Lake Kissimmee) contributed about 60 percent of the flow, 49 percent of the nitrogen load, and 86 percent of the phosphorus loads at the most downstream control structure. RADIOCHEMICAL MONITORING OF WATER AFTER THE CANNIKIN EVENT, AMCHITKA ISLAND, ALASKA, MAY 1974,
Geological Survey, Denver, Colo.
W. Thordarson, and W. C. Ballance.
Contract report USGS-474-226 (Amchitka-45) for U S Energy Research and Development Administration, 1976. 19 p, 3 fig, 3 tab, 9 ref. USERDA Agreement E(29-2)-474.

Descriptors: *Radiochemical analysis, *Water analysis, *Nuclear explosions, *Underground, *Alaska, Water pollution sources, Nuclear wastes, Tritium, Baseline studies, Evaluation, Path of pollutants.
Identifiers: *Amchitka(Alaska).

During May 1974, the U.S. Geological Survey collected water samples from Amchitka Island, Alaska. Tritium determinations were made on 99 water samples, and dissolved gross alpha and gross beta/gamma determinations were made on 34 water samples. No appreciable differences were found between the data obtained in May 1974 and the data obtained before the Cannikin underground nuclear explosion on November 6, 1971. Water samples were collected from wells, streams, lakes, springs, and seeps. Seawater samples were collected both at the shoreline and offshore. (Woodard-USGS)
W76-07606

RADIOCHEMICAL MONITORING OF WATER AFTER THE CANNIKIN EVENT, AMCHITKA ISLAND, ALASKA, AUGUST 1974, AND CHEMICAL MONITORING FROM JULY 1972 TO JUNE 1974,
Geological Survey, Denver, Colo.
W. Thordarson, and W. C. Ballance.
Contract report USGS-474-225 (Amchitka-44) for U S Energy Research and Development Administration, 1976. 19 p, 3 fig, 3 tab, 10 ref. USERDA Agreement E(29-2)-474.

Descriptors: *Radiochemical analysis, *Water analysis, *Nuclear explosions, *Underground, *Alaska, Baseline studies, Water quality, Groundwater, Surface waters, Tritium, Chemical analysis, Water pollution, Evaluation.
Identifiers: *Amchitka Island(Alaska).

Radiochemical data from the Amchitka Island, Alaska, study area were obtained from water samples collected by the U.S. Geological Survey during August 1974. Tritium determinations were made on 18 samples, and gross alpha and gross beta/gamma determinations were made on 12 samples. No appreciable differences were found between the data obtained during August 1974 and the data obtained before the Cannikin event (underground nuclear detonation Nov. 6, 1971). Chemical analyses were made on 4 samples collected in 1971, 15 samples in 1972, 11 samples in 1973, and 7 samples in 1974. Comparison of these analyses to analyses of samples collected before the Cannikin event indicates no changes outside of

the seasonal range normally found at the sampling locations. (WoodardnUSGS)

LAKE ERIE, OHIO, PENNSYLVANIA, NEW YORK INTAKE WATER QUALITY SUMMARY 1972,
Environmental Protection Agency, Fairview Park, Ohio.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-242 591, $11.00 in paper copy, $2.25 in microfiche. December 1973. 403 p. 1 fig., 4 tab.

Descriptors: *Potable water, *Lake Erie, *Water analysis, *Intakes, Ohio, Pennsylvania, New York, Water properties, Monitoring, *Data collections, Chemical properties, Physical properties, Bottom sediments, Coliforms, Water temperature, Hydrogen ion concentration, Conductivity, Alkalinity, Turbidity, Color, Odor, Suspended solids, Dissolved solids, Hardness(Water), Chlorides, Sulfates, Ammonia, Nitrogen compounds, Phosphorus compounds, Dissolved oxygen, Biochemical oxygen demand, Chemical oxygen demand, Phenols, Detergents, Silica, Zinc, Copper, Chromium, Iron, Nickel, Cadmium, Lead, Mercury, Arsenic compounds, Manganese, Fluorides, Enteric bacteria, Phytoplankton, Zooplankton, Heavy metals, Toxins.
Identifiers: Cyanide, Silver, Barium, Selenium, STORET.

Progress made on the cooperative water quality surveillance program between the Ohio Environmental Protection Agency, New York State Department of Environmental Conservation, Pennsylvania Department of Environmental Resources, municipalities, and the EPA at 21 water treatment intakes in Lake Erie during 1972 is detailed. The program is part of a system for monitoring interstate waters by participating state and municipal agencies for water quality standards compliance and supplements federal surveillance efforts of Lake Erie. Water quality information is entered into the STORET data processing system. Water intake physical data and the chemical, physical, and biological characteristics of the sediment in each intake area are described. Water chemical and microbiological data includes temperature, pH, conductivity, alkalinity, turbidity, color, odor total solids, total dissolved (filterable) solids, total suspended (non-filterable) solids, hardness, chlorides, sulfates, cyanide, nitrite nitrogen, nitrate nitrogen, ammonia nitrogen, albuminoid nitrogen, total phosphorus, soluble phosphorus, chlorine demand, dissolved oxygen, biochemical oxygen demand, chemical oxygen demand, phenols, methylene blue active substances (anionic detergents), dissolved silica, zinc, silver, copper, hexavalent chromium, chromium, iron, nickel, cadmium, barium, lead, mercury, arsenic, selenium, manganese, fluoride, total and fecal coliforms, total bacteria, and phytoplankton and zooplankton evaluations plus air temperature, wind direction and velocity studies. (Buchanan-Davidson--Wisconsin).

WRC AIDS UNIQUE WATER QUALITY MONITORING PROJECT.
Water Pollution Research Lab., Stevenage (England).
Water Research Newsheet, February 1976, p. 5. 2 fig.

Descriptors: *Water quality, *Monitoring, *Intakes, Automatic control, Equipment, Design, Europe, *Pollutant identification, Analytical techniques.
Identifiers: England.

The schematic of a water quality monitoring station, designed to protect a water intake on the River Wear, England, is illustrated. The system will be installed 2-1/2 miles upstream from the intake and will measure dissolved oxygen, temperature, turbidity, ammonia, organic pollutants, and water levels. Via a dual-sensor configuration, one sensor monitors raw water and the other clean water; if the former indicates a value outside present limits the sensors are switched over by means of a novel valve system to provide a check. Readings will be continuously relayed by telemetric links to the water treatment plant for proper action. The system will be supplemented by some form of biological monitoring to provide an alert for toxic substances. (Auen-Wisconsin).

POLLUTANTS 'FINGERPRINTED' BY RADIOACTIVE METHOD.
California Geology, Vol. 26, No. 11, p 276-277, November, 1973. 1 fig.

Descriptors: Waste water treatment, *Industrial wastes, *Oil industry, Carbon radioisotopes, Oil wastes, *Pollutant identification, Analytical techniques, Radioactivity techniques, Radioisotopes, Water pollution sources, *Organic wastes.
Identifiers: *Radioactive fingerprinting.

Radioactive fingerprinting of organic wastes, by separating the major types of carbon compounds, will aid pollution-control agencies with organic-pollution abatement and litigation problems. The radioactive fingerprinting method measures the differences in amounts of radioactive carbon isotopes found in fossil and modern organic pollutants. The fossil fuel waste discharged by petrochemical plants contains no radioactive carbon-14, while the organic wastes from sewage and feedlots will reflect the current atmospheric concentrations of carbon-14. A comparison of the concentrations of carbon-14 in a polluted stream to modern atmospheric concentrations allows the determination of the quantity of organic pollution derived from fossil fuels and the quantity from modern wastes. (Sandoski-FIRL)
W76-07629

NEW OIL POLLUTION DETECTOR.
Water and Waste Treatment, Vol. 16, No. 10, p 16, October, 1973. 1 fig.

Descriptors: Waste water treatment, *Industrial wastes, Oil industry, *Oil wastes, *Pollutant identification, Analytical tehniques, Equipment, *Monitoring, *Separation techniques, Rivers, Oceans, Oil pollution.

After several years of research by International Combustion of Derby, an oil pollution monitoring system has been developed. The oil pollution detector, Type 4979, is a completely weatherproof instrument which has been designed for the continuous monitoring of oil in industrial effluent, river and sea water. A sampling system has been designed for use with the monitor by Megator Pumps and Compressors Limited. The sampling system skims the surface of the water and passes a sample to the unit. An alarm is activated by the monitor if an abnormal amount of oil is present. Samples can also be obtained by the use of a discharge pipe. A sophisticated oil separation system enables the monitor to separate oil from any other contaminants found in the water. (Sandoski-FIRL)

ACCUMULATION OF MERCURY BY FISH OF THE LITTLE PINEY RIVER AND MILL CREEK,
Missouri Univ., Rolla. Dept. of Chemistry.
J. O. Stoffer, W. T. Schrenk, and E. T. Lloyd.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-252 941, $4.00 in paper copy, $2.25 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, March 26, 1976. 32 p, 5 fig, 2 tab, 20 ref. OWRT A-083-MO(1) 14-31-0001-5025.

Descriptors: *Mercury, Freshwater animals, Fish, *Absorption, *Missouri, *Trout, *Pollutant identification, Bioassay, Streams, Analytical techniques, Water quality.
Identifiers: *Flameless atomic absorption.

A study of mercury accumulation in trout taken from the trout parks and streams of southern Missouri is presented. Mercury in trout is determined by digestion in nitric acid, sulfuric acid, and potassium permanganate, followed by reduction and aeration for measurement by flameless atomic absorption. The mercury accumulation in trout collected and analyzed in this project ranged from 0.1 to 0.3 ppm mercury (microgram mercury/g of tissue). The mercury levels were relatively constant and showed no variation or higher level accumulation with increased size. Levels in the liver were slightly higher than levels in the flesh of the same trout. Previous analysis of trout collected in the mid to late 1950's from the Little Piney River indicated mercury accumulations of approximately 3 ppm. Over the past 25 years, there has been a substantial decrease in mercury found in trout of southern Missouri as a result of cleaner streams.
W76-07670

DETECTION OF TRACE PHOSPHORUS IN NATURAL WATERS BY GRAPHITE OVEN FLAME ANALYSIS,
Georgia Univ., Athens. Dept. of Chemistry.
D. R. Campbell.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 952, $4.00 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report ERC-0276, February 1976, 37 p, 9 fig., 1 tab, 22 ref. OWRT A-061-GA(1). 14-31-0001-5010.

Descriptors: *Phosphorus, *Flame photometry, Analysis, Nutrients, *Pollutant identification, Photometry, Analytical techniques, Chemical analysis, Methodology, Trace elements, Water analysis, Instrumentation.
Identifiers: Graphite furnace.

Phosphorus is analyzed by coupling a graphite furnace to a flame photometer. A sample is added to the furnace where it is dried and vaporized at temperatures which can be as high as 2800 C. The sample is swept out of the furnace by nitrogen mixed with air, and drawn into a hydrogen-air flame. In the flame, POH emission is observed and integrated. The emission is subject to interference from calcium and ferric iron; however, by adding a 'constant matrix' of calcium and EDTA to both samples and standards, it was possible to determine total phosphorus in sewage samples. This method has a detection limit of 3 micrograms g/liter phosphorus. The relative standard deviation on repeat measurements of a solution containing 1 mg/liter phosphorus was between 2 and 3%. An analysis, including sample pretreatment, requires less than two minutes. The instrumentation can be used in mobile laboratories for field analyses. Because of its greater sensitivity and reduced time requirement, this method is a superior alternative to present methods for phosphorus. It will be very useful in rapidly screening water samples for high levels of phosphorus.

HEAVY METALS IN AGRICULTURAL LANDS RECEIVING CHEMICAL SEWAGE SLUDGES, VOLUME III,
Ontario Inst. for Environmental Studies, Toronto.
J. C. Van Loon.
Research Report No. 30, Training and Technology Transfer Division (Water), Environmental Protection Services, Environment Canada, Ottawa, Canada, 37 p., 2 fig., 10 tab, 22 ref., (1976). 72-5-3.

Descriptors: *Heavy metals, *Sewage, *Sludge, Agriculture, *Lands, Metals, *Sewage sludge, Analysis, Absorption, Mercury, Molybdenum, Gas chromatography, Canada, Chemical analysis, *Pollutant identification.
Identifiers: Electro-chemical techniques, Arsenic, Selenium, Tin, Thermal volatility, Ontario, Sludge analysis.

Existing and newly developed methods for the analysis of metals in sewage sludges are described. Atomic absorption and electro-chemical techniques are emphasized. Procedures developed specifically for arsenic, selenium, mercury, tin and molybdenum analyses are included. The quartz 'T' tube furnace for flameless atomic absorption studies of thermal volatility and gas chromatography of metal compounds in sludge has been developed and is described. A number of chemical sewage sludges were analysed for metals and the results are tabulated. (Environment Canada)

HIGH-SPEED LIQUID CHROMATOGRAPHIC CLEANUP OF ENVIRONMENTAL SAMPLES PRIOR TO THE GAS CHROMATOGRAPHIC DETERMINATION OF LINDANE,
Canada Centre for Inland Waters, Burlington (Ontario).
R. H. Larose.
J Assoc Off Anal Chem. 57(5), p 1046-1049, 1974.

Descriptors: Sampling, *Environment, *Cleaning, *Chromatography, *Gas chromatography, *Pollutant identification.
Identifiers: *Lindane, Liquid chromatography.

A method is described which permits the removal of interfering co-extractives from lindane, using high-speed liquid chromatography. Fractions are collected from the liquid chromatograph for further analysis by gas-liquid chromatography. The cleanup procedure takes less than 5 min and recoveries of more than 90% are obtained. The detection limit for water samples is 5 ng/L. Copyright 1974, Biological Abstracts, Inc.
W76-07701

DETERMINATION OF ZINC AND CADMIUM IN ENVIRONMENTALLY BASED SAMPLES BY THE RADIOFREQUENCY SPECTROMETRIC SOURCE,
Oak Ridge National Lab., Tenn.
Y. Talmi.
Anal Chem. 46(8), p 1005-1010, 1974.

Descriptors: *Cadmium, *Zinc, *Sampling, Trace elements, Spectroscopy, Environment, Analysis, *Analytical techniques, Coal, Flyash, Gasoline, Soil, Cattle, Leaves, Fish, Gonads, *Pollutant identification.
Identifiers: *Radiofrequency furnace spectrometry, Bunker oil, Liver.

The applicability of the radiofrequency furnace (RFF) spectrometric source to the analysis of trace amounts of Cd and Zn in environmental samples is described. Modifications in the original design of the system were employed to enhance sensitivity and reduce interferences. Both atomic absorption (AA) and atomic emission (AE) spectrometric modes were successfully used with samples pretreated by various methods such as wet ashing, on-substrate wet ashing and Soluene solubility, and by direct analysis. Samples analyzed include coal, fly ash, bunker oil, gasoline, soil, bovine liver, orchard leaves and fish gonad. The samples, once prepared, were analyzed at the rate of 5 per minute with an average overall accuracy of 6.8% and reproducibility of 5.5%. Detection limits for Cd and Zn were 5 pg with the AA mode and 6 and 8 pg, respectively, with the ZE mode. Relative sensitivities are in the 0.001-0.5 ppm range. Interferences in the 2 operating modes are compared. Copyright 1974, Biological Abstracts, Inc.

ANALYSIS OF THE POLYCHLORINATED BIPHENYL PROBLEM, APPLICATION OF GAS CHROMATOGRAPHY-MASS SPECTROMETRY WITH COMPUTER CONTROLLED REPETITIVE DATA ACQUISITION FROM SELECTED SPECIFIC IONS,
National Environmental Research Center, Cincinnati, Ohio. Analytical Quality Control Lab.
J. W. Eichelberger, L. E. Harris, and W. L. Budde.
Analytical Chemistry, Vol. 46, No. 2, p 227-232, February, 1974. 6 fig, 3 tab.

Descriptors: *Gas chromatography, *Mass spectrometry, *analytical techniques, Computers, Ions, Monitoring, Pesticides, *Pollutant identification, Water pollution sources, Lakes, *Polychlorinated biphenyls.

An application of gas chromatography-mass spectrometry with computer controlled repetitive data acquisition from selected specific ions was used for polychlorinated biphenyl (PCB) analysis. The application of subset data acquisition techniques were examined for the possibility of a procedure which is sufficiently sensitive, but which eliminates the need for elaborate separations, and does not sacrifice too much of the qualitative information content inherent in a complete mass spectrum. Several sets of candidate masses were evaluated using PCB's mixed with certain pesticides which are likely to be in a solvent extract of an environmental sample. The method has also been tested with a contaminated sediment sample from an Ohio lake and appears useful for both qualitative and quantitative analyses. (Sandoski-FIRL)

AIR QUALITY IN THE LAKE TAHOE BASIN,
California Univ., Davis. Inst. of Ecology; and California Univ., Davis. Dept. of Physics.
T. A. Cahill.
In: Proceedings: Lake Tahoe Research Seminar II, 27 September 1974, Sands Vagabond Convention Center, South Lake Tahoe, California. Report No. NSF/RA/G-74-012, p 63-68. 1 ref.

Descriptors: *Air pollution, *Aerosols, Sulfur, Haze, Pollutants, Mountains, Lakes, Fuels, Fossil fuels.
Identifiers: *Lake Tahoe(Nev-Calif), *Air pollution sources, Visibility.

Lake Tahoe is over twenty miles long, yet we expect to see the mountains on the far side--an important part of the scenic value. Thus, a significant part of the recreational value of the lake is based upon visibility greater than thirty miles most of the time. The problem of area-wide degradation of visibility is one which is vital to Lake Tahoe's future. Other sites in California show that fine sulfur particulates are likely to be responsible for the hazes presently seen at Lake Tahoe on many summer days. There are four sources of fine sulfur aerosols that could cause problems: (1) fuel oil combustion in the basin; (2) the conversion of residual sulfur in gasoline into fine sulfur particulates, an unfortunate byproduct of the EPA mandated catalytic converters on new cars sold in California; (3) the landing-take off cycle of a Boeing 727, which produces as much sulfur oxides as about 500 cars driving from Meyers to Stateline; and (4) transport of fine sulfur particulates present in the Sacramento valley or Reno area into the basin. Descriptors: *Potable water, *Organic wastes, Europe, Sampling, *Analytical techniques, Lakes, *Water pollution sources, *Pollutant identification.
Identifiers: Closed-loop air stream, Lake Zurich, *Switzerland, Zurich.

The method of transferring organic substances from water at room temperature on to an adsorbent filter by a closed-loop air stream was applied to various water samples. These include water from Lake Zurich (Switzerland) taken at different depths and under different weather conditions, as well as relatively pure samples of spring, ground and tap water. In a sample of accidentally contaminated water the degree and the (unexpected) source of contamination were determined, neither of which could be done by commonly used methods. The characteristics and origin of various water pollutants and concentrations of selected pollutants are given. (See also W75-08556)--Copyright 1974, Biological Abstracts, Inc.

THE PRESERVATION AND STORAGE OF URINE SAMPLES FOR THE DETERMINATION OF MERCURY,
Los Alamos Scientific Lab., N. Mex. Health Div.; and Los Alamos Scientific Lab., N. Mex. Bio-Analysis and Chemical Section.
P. Trujillo, P. Stein, and E. Campbell.
Am Ind Hyg Assoc J. 35(5), p 257-261, 1974.

Descriptors: Analytical techniques, *Mercury, *Sampling, *Urine, Preservation, *Pollutant identification.
Identifiers: Containers, Glass containers, Paper containers, Plastic containers.

The use of various preservatives and storage containers for the sampling of (human) urine and water samples for Hg analysis was evaluated. Glass storage containers were preferred over paper or plastic containers. Potassium persulfate, when added to the sample at the time of collection preserved the sample for several days without significant losses. Potassium permanganate was unacceptable for preserving Hg in aqueous solution because of the formation of insoluble manganese dioxide.--Copyright 1974, Biological Abstracts, Inc.

ISOTOPIC RATIOS OF RADIORUTHENIUM AND RADIOCERIUM IN RAIN WATER AT OSAKA IN RELATION TO NUCLEAR EXPLOSIONS DURING THE PERIOD OF LATE 1969 TO 1972,
Radiation Center of Osaka Prefecture, Osaka (Japan). Dept. of Physical Instrument.
T. Matsunami, A. Mizohata, and T. Mamuro.
J Radiat Res. 15(2), p 96-102, 1974.

Descriptors: *Rain, *Radioactivity, *Nuclear wastes, Radioisotopes, Isotope studies, Pollutant identification.
Identifiers: *Cerium, *Explosions, Osaka, *Ruthenium, Stratosphere, Strontium, Troposphere, *Japan.

The isotopic activity ratios of 103Ru to 106Ru and 141Ce to 144Ce in rain water were studied during the period of late 1969- Aug. 1972. The ratios demonstrated many peaks during the observation period, each of which probably resulted from settlement of stratospheric or tropospheric nuclear debris produced by nuclear explosions during the same period. A method of distinguishing fresh nuclear debris from old debris on the basis of measured radiostrontium activity ratios was applied to estimate the contributions of the 106Ru and 144Ce produced by a new explosion to the total depositions of these nuclides from the measured activity ratios of 103Ru to 106Ru and 141Ce to 144Ce. The contributions thus estimated ranged from zero to nearly 100%, depending on various factors.

MEASUREMENTS OF PHYTOL IN ESTUARINE SUSPENDED ORGANIC MATTER,
Naval Research Lab., Washington, D.C.
D. M. Schultz, and J. G. Quinn.
Mar Biol (Berl). 27(2), p 143-146, 1974.

Descriptors: *Suspended solids, Organic wastes, *Chlorophyll, Analytical techniques, *Gas chromatography, Chromatography, *Rhode Island, *Bays, *Estuarine environments, *Pollutant identification, Measurement, Spectrophotometry.
Identifiers: *Phytol, Narragansett Bay(RI), Isoprenold alcohol phytol.

The unsaturated isoprenold alcohol phytol is a constituent of the major chlorophyll species a and b and, as such, should be useful as an estimator for chlorophyll values. A method for the extraction of phytol from estuaring suspended organic matter and analysis by gas-liquid chromatography (GLC) is described. Comparisons of the GLC method for phytol.chlorophyll analyses and a spectrophotometric chlorophyll method indicate that the GLC method gives values in good agreement with the spectrophotometric procedure. Similar trends in suspended chlorophyll values were observed in Narragansett Bay (Rhode Island) water samples using the GLC method and a fluorometric procedure. The results of these studies indicate that the GLC method provides reliable analyses of chlorophyll and, although more time-consuming, has the advantage that other organic species can be analyzed in the same sample.--Copyright 1975, Biological Abstracts, Inc.

THE PRESENT CONDITION OF WATER POLLUTION AND THE FUTURE PROBLEMS (SUISHITSU ODAKU NO GENJO TO KONGO NO MONDAITEN),
Japan Environmental Agency, Tokyo.
K. Hoashi.
Kankyo Gijutsu, (Environmental Conservation Engineering) Vol. 2, No. 1, p 14-21, January, 1973. 3 tab.

Descriptors: *Water quality, *Water pollution, Investigations, *Toxicity, Sampling, Standards, Cadmium, Lead, Mercury, Phosphorus, Chromium, Biochemical oxygen demand, Chemical oxygen demand, Pollutant identification.
Identifiers: Japan, Cyanogen, Arsenic, Coli baccilus.

A 1971 investigation of Japan's public water quality resulted in the following published information. Samples for the examination of toxic matter were collected at 1966 locations, and those for living

standards were collected at 1253 locations including 330 rivers, 9 lakes, and 68 sea locations. Toxicity was analyzed in 89,074 test samples with 0.6 percent failure to pass the acceptable quality standard; in 1970, the failure percentage was 1.4. As in 1970, cyanogen (1.2%), cadmium (0.7%), and lead (1.4%) were the elements that had highest failure rates. Other major toxic substances were alkyl mercury, organic phosphorus, chromium, arsenic, and total mercury. In the examination of environmental standards, 22.6 percent of the 76,757 samples failed to meet the requirements. For rivers, 30 to 70 percent failed to meet the standard BOD level and 50 to 70 percent of the samples failed to pass the standard for presence of coli baccilus. 43.9 percent failed to pass the standard for lakes and ponds. Of the 15,960 sea water samples, 17.8 percent failed to meet the COD standard. (Seigle-FIRL)

OXYGEN MEASUREMENT IN ACTIVATION BASINS WITH THE ZUELLIG-02-PROBE,
K. Scherb, and H. Bauer.
Wasser- und Abwasser-Forschung, Vol. 6, No. 3, p 93-94, 1973. 2 fig.

Descriptors: *Measurement, *Instrumentation, *Oxygen, *Activated sludge, Electrolytes, Analytical techniques, *Pollutant identification.
Identifiers: Oxygen sensors, Activation basins, *Zuellig oxygen probe.

Encouraging results have been gained during a three-month operation in an activated sludge basin using a Zuellig type oxygen sensor. The device, especially suited for long-term measurement of the oxygen content in activation basins, is operated according to the Toedt principle, providing polarization current between two different noble metals in an electrolyte solution. The magnitude of the polarization current is determined by the oxygen content of the medium. The probe is composed of a plastic tube with two metal rings (electrodes) at its lower extremity, which are continuously cleaned by a rotating grindstone. The probe is splash-proof, non-corrosive, and permits nearly maintenance-free, long-term measurements even under rough working conditions. (Tacaks-FIRL)
W76-08019

APPLICATION OF THE STAINTON SYRINGE METHOD TO THE ANALYSIS OF MERCURY IN NATURAL WATERS,
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
J. A. J. Thompson, and F. T. McComas.
Environmental Letters, Vol. 5, No. 3, p 189-197, 1973. 1 fig, 1 tab, 12 ref.

Descriptors: Analytical techniques, *Mercury, *Water analysis, *Spectrophotometry, Measurement, *Pollutant identification, Separation techniques.
Identifiers: *Atomic absorption spectrophotometry.

A relatively inexpensive, simple, and precise method for the analysis of subnanogram quantities of mercury in natural waters involving the use of wet chemical procedures to preconcentrate the mercury and a 'semi-micro' method of analysis based on atomic absorption spectrophotometry is described. Through a combination of a solvent extraction procedure and a 'cold-vapor' technique, standard deviations of plus or minus 0.0112 can be obtained at the mean concentrations of 0.023 and 0.166 ng/ml, respectively. Recoveries of 94 percent are reported. (Sandoski-FIRL)
W76-08025

AN IMPROVED METHOD FOR THE ISOLATION OF PHENOLS FROM WATER,
Washington and Jefferson Coll., Pa. Dept. of Chemistry.
J. A. Vinson, G. A. Burke, B. L. Hager, D. R. Casper, and W. A. Nylander.
Environmental Letters. Vol. 5, No. 3, p 199-207, 1973. 2 tab, 6 ref.

Descriptors: *Analytical techniques, *Phenols, *Water analysis, Colorimetry, Sampling, Adsorption, *Pollutant identification, Separation techniques, *Methodology.
Identifiers: Aminoantipyrine.

A rapid and sensitive method for the separation and isolation of phenols from waters has been developed which uses a column adsorption and desorption procedure prior to the analysis by colorimetry with aminoantipyrine. In comparison with separation by distillation, this method is accurate and precise and agrees well with the widely used distillation procedure. The column procedure is faster and requires less laboratory space than the distillation procedure. A typical analysis of 5 liters of 10 micrograms/liter phenol requires only 45 minutes. The sensitivity of the method is not dependent on the colorimetry but only on the volume of water analyzed. The column procedure thus allows sub-microgram/liter concentrations to be analyzed using conventional colorimetry instead of expensive gas chromatography instrumentation by simply sampling and analyzing greater than 50 liters of water. (Sandoski-FIRL)
W76-08026

A NEW CONVENIENT METHOD FOR DETERMINING ARSENIC(+3) IN NATURAL WATERS,
Rutgers The State Univ., New Brunswick, N. J. Dept. of Environmental Sciences.
W. H. Clement, and S. D. Faust.
Environmental Letters, Vol. 5, No. 3, p 155-164, 1973. 1 fig, 3 tab, 16 ref.

Descriptors: *Analytical techniques, *Arsenic compounds, *Water analysis, Investigations, Surface waters, Groundwater, *Pollutant identification.
Identifiers: Arsenate, Arsenite.

A convenient method for the determination of arsenic(+3) in natural waters based on a simple modification of the silver diethyl-dithiocarbamate 'Standard Method' for inorganic arsenic is described. In practice the technique was found to detect an average of 96 percent of the As(+3) present in samples. Less than one percent of any As(+5) present was analyzed as As(+3) by the method. The analytical procedure was used successfully to investigate surface waters, groundwater, and simulated reservoir water. In combination with the current 'Standard Method', the newly developed procedure allows an easy sorting of the inorganic arsenic in the waters into As(+3), arsenite, and As(+5), arsenate. (Sandoski-FIRL)
W76-08027

DATA TRANSMISSION SYSTEM MONITORS RIVER POLLUTION.
Control and Instrumentation, Vol. 5, No. 7, p 11, July/August, 1973.

Descriptors: *Data transmission, *Monitoring, Rivers, Water pollution sources, Floods, Warning systems, Rainfall, Path of pollutants, Pollutant identification.
Identifiers: Devon River Authority, Telephone system, River level.

A low-cost data transmission system developed in conjunction with the Devon River Authority, which uses the public telephone network to provide continuous monitoring of river pollution and/or give early flood warnings, has been developed by Delta Controls Ltd., of Kingston-on-Thames. Known as the Deltrol TeleGen systems, the solid-state equipment can be used to monitor rainfall and river levels at each of the remote stations to be monitored. Each channel in use is dedicated to a function and scanned and transmitted in order. If a reading needs to be double-checked, it is only necessary to replace the receiver and dial the number again. The memory is not reset if interrogated by accident and because it is continually up-dated, the risk of outside interference is eliminated. Apart from the initial cost of the equipment, the only other expenditure required is a low rental charge for a telephone at the stations. (Sandoski-FIRL)

5B. Sources Of Pollution

EVALUATION OF A SOIL NITRATE TRANSPORT MODEL,
New York State Coll. of Agriculture and Life Sciences, Ithaca. Dept. of Agricultural Economics.
M. F. Walter, T. S. Steenhuis, G. D. Bubenzer, and J. C. Converse.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois 5 fig, 8 tab, 10 ref. OWRT-B-076-WIS(5).

Descriptors: *Model studies, *Nitrates, *Soil water movement, Groundwater, Pollutants, Leaching, *Farm wastes, Groundwater movement, *Water pollution sources, Dairy industry, Liquid wastes, Coarse sediments, Sands, Silts.

The potential for groundwater pollution from heavy land applications of dairy manure is a growing concern because manure is being concentrated in smaller areas. The worst conditions in terms of nitrate leaching to the groundwater occur on coarse textured soils in early spring. A computer model was developed specifically for heavy spring application of liquid dairy manure on coarse soils. The model was used to predict nitrate movement from the application of manure on experimental plots on a Plainfield sand and in a Plano silt loam soil column. The computer model was designed to estimate, for specified intervals of soil depth and time after manure application, the delay to initial nitrification of manurial ammonium, ammonium nitrification rate, soil organic nitrogen mineralization rate, nitrate dispersion, nitrate and ammonium content and soil moisture. Precipitation and temperature data, date of manure application, ammonium concentration of liquid manure, and quantity of manure applied must be specified for each particular case. When the model properly simulates nitrate movement through a soil, the results are no better than the input weather data. The model depends on interrelationship between temperature and effective precipitation over a period of several weeks or months. Input weather data should be based on the probability of a sequence of particular weather conditions occurring. (Skogerboe-Colorado State)

CHESAPEAKE BAY RADIOACTIVE TRACER STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
A. R. Tool.
Miscellaneous Paper H-76-1, January 1976. 34 p, 4 fig, 1 tab, 9 pl, 15 ref, append.

Descriptors: *Chesapeake Bay, *Radioactivity techniques, *Tracers, *Path of pollutants, Tides, Bays, Waste disposal, *Maryland, Pollutant identification.
Identifiers: *Dredged material, *Tidal currents, Pooles Island(Md).

A radioactive tracer study was conducted in the Chesapeake Bay near the Pooles Island Deep disposal area to obtain qualitative information concerning movement of dredged material placed in the area. Approximately 15 curies of gold(198) was mixed with a sediment sample and placed on the bottom of the Bay. Daily tracings of the labeled sediment revealed movement along a narrow band in the general direction of the tidal currents. Movement in the direction of flood flow was determined to be much greater than that in the direction of ebb flow. (WES)

FACTORS AFFECTING WATER QUALITY FROM STRIP-MINED SITES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Engineering; and Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
J. F. Connell, D. N. Contractor, and V. O. Shanholtz.
Virginia Water Resources Research Center, Blacksburg, VWRRC Bulletin 87, March 1976, 75 p. 18 tab, 18 fig, 19 ref.

Descriptors: Water quality, *Mine drainage, Strip-mines, Watershed management, Model studies, Linear programming, Oxidation, Forecasting, *West Virginia, *Path of pollutants, Drainage.
Identifiers: *Strip-mine drainage, Mine runoff, Pyrite oxidation.

This project analyzed the parameters that influence the quality of water from stripmined sites. An instrumented watershed near Beckley, W. Va. provided data on precipitation, stream flow, and water quality, both before and during mining operations. The data were analyzed to derive linear relationships between a water-quality parameter and such variables as temperature, current and antecedent precipitation, and the extent of the area disturbed by mining. Mathematical formulae representing sulfate and calcium concentration, alkalinity, turbidity, conductance, and discharge were used in the study. A correlation analysis also was made among the various water-quality parameters. A formula in each water-quality parameter was derived for each of three conditions: (1) before mining; (2) during mining for the disturbed area alone, and (3) during mining for the entire watershed. The coefficients in the formulae then were refined for minimum error. The coefficients indicate that temperature is not an important water-quality consideration except in the case of alkalinity. The coefficients of the antecedent precipitation terms indicate that, in most cases, surface runoff isthe basic mechanism by which the substances affecting water quality are conveyed from the disturbed area into a receiving stream. The findings provide data that can be used in the future for predicting water-quality impacts from strip-mining operations at particular sites in the study area.

QUALITY AND QUANTITY OF NONPOINT POLLUTION SOURCES IN RURAL SURFACE WATER RUNOFF ON OAHU, HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
S. K. Yim, and G. L. Dugan.
Available from the National Technical Information Service, Springfield, Va 22161, as PB- 252 765, $4.50 in paper copy, $2.25 in microfiche. Technical Report No. 93, June 1975. 60 p, 17 fig, 15 tab, 42 ref. OWRT A-044-HI (1) 14-31-0001-5011.

Descriptors: *Eutrophication, *Nutrients, *Rural areas, *Sediment, Water quality, Surface runoff, Nitrogen, Phosphorus, *Hawaii, Water pollution sources, Agricultural runoff, Sampling, Chemical oxygen demand, Storm runoff.
Identifiers: Tipping bucket, Forest runoff, *Nonpoint pollution sources.

The quality and quantity of rural runoff was the subject of a field study conducted on the island of Oahu. The study investigated surface water runoff from three rural land uses: an undeveloped forested area, a sugarcane field, and a pineapple field. A 37.85-l (10-gal) tipping bucket sampler was used to collect composited runoff samples at each site and to record the volume of runoff associated with each sample. The results show that storm water runoff from undeveloped areas is the major contributor of nutrient, COD, and sediment, into wet weather streamflow. Furthermore, nutrients and COD in this type of runoff are primarily in sediment-associated forms. The sugarcane field samples included storm runoff and irrigation tailwater. Cane field runoff in central Kunia was lower in most water quality parameters than the forest runoff in Manoa. Insufficient samples due to dry weather prohibited a thorough analysis of pineapple field runoff.
W76-07583

EFFECTS OF CAGE CULTURE OF CATFISH UPON WATER QUALITY IN RESERVOIRS,
Clemson Univ., S. C. Dept. of Entomology.
H. A. Loyacano, Jr., and A. M. Burch.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-252 766, $3.50 paper copy, $2.25 in microfiche. South Carolina Water Resources Research Institute, Clemson. (1976) Report 61, 12 p, 2 tab, 18 ref. OWRT B-033-SC (1)

Descriptors: *Water quality, *Aquiculture, *South Carolina, Catfishes, Reservoir, Lakes, *Monitoring, Water pollution sources, Water pollution effects.
Identifiers: *Catfish cage culture, Thermal effluents, Lake Keowee(SC), Lake Hartwell(SC).

Water quality was monitored in Lakes Keowee and Hartwell, South Carolina, at sites proximal to cages and at control sites before, during, and after periods when catfish were fed in the cages. Parameters measured were alkalinity, carbon dioxide, dissolved oxygen, nitrate nitrogen, orthophosphate, temperature, and turbidity in both lakes; total phosphate, total hardness, and ammonia nitrogen in Lake Hartwell only; and Secchi-disk transparency in Lake Keowee only. Water quality was not significantly different between cage and control sites.

HYDROLOGIC CHARACTERISTICS OF LAGOONS AT SAN JUAN, PUERTO RICO, DURING A JANUARY 1974 TIDAL CYCLE,
Geological Survey, Fort Buchanan, Puerto Rico.
S. R. Ellis, and F. Gomez-Gomez.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-250 972, $4.50 printed copy; $2.25 microfiche. Water-Resources Investigations 38-75, January 1976. 45 p, 28 fig, 8 tab, 8 ref.

Descriptors: *Tidal effects, *Lagoons, *Water quality, *Flow rates, *Puerto Rico, Data collections, Hydrologic properties, Salinity, Sewage effluents, Urban runoff, Industrial wastes, Canals, Surface waters, *Path of pollutants.
Identifiers: *San Juan(P R), Tidal cycle effects.

The lagoons in the San Juan area, Puerto Rico consist of Laguna La Torrecilla, Laguna de Pinones, Laguna San Jose, and Laguna del Condado. They are interconnected by canals, except for Laguna del Condado, which is connected to the other lagoons by way of Bahia de San Juan. The lagoons contain saline to brackish water, raw and partly treated sewage, urban runoff, and industrial effluents. Flows were measured and water-quality was sampled hourly for a tidal cycle (25 hours) in January 1974 at each connecting canal and outlet to the ocean. Interlagoon and ocean-lagoon flows, total organic carbon, total phosphorus, total orthophosphate, and suspended-sediment loads were calculated for a tidal cycle. Combined outflows of the Rio Puerto Nuevo and Cano de Martin Pena were calculated for the Cano de Martin Pena at the Constitution Bridge site. (Woodard-USGS)

LABORATORY MODEL STUDY OF THE EFFECTS ON THE AQUATIC MICROFLORA OF COAL-WASHING PLANT-GENERATED WASTE WATERS (SZENMOSO-UZEMI SZENNYVIZEK ELOVIZEKRE GYAKOROLT HATASNAK LABORATORIUMI MODELLVIZSGALATA),
J. Gellen, and J. Kenyeres.
Banyaszati es Kohaszati Lapok-Banyaszat, Vol. 106, No. 8, p 540-545, 1973. 13 fig, 4 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Environmental effects, Aquatic plants, Aquatic microorganisms, Model studies, Chemical oxygen demand, *Activated sludge.
Identifiers: Coal-washing wastes, Microflora.

The effect of coal-washing plant-generated waste water on aquatic microflora was studied in a model experiment, using phenol-adapted activated sludge for aquatic microflora, hard coal slurry for effluent, and sodium chloride for modeling salt loads. The relevancy of the COD value, determined by means of the strong oxidizing agent potassium dichromate, for the evaluation of the biologic oxidizability of coal-washing plant-generated effluents, was also investigated. Findings indicated that hard coal slurries are readily oxidizable chemically, but have negligible BOD5 values. Inhibition of the activated sludge, and considerable reduction in the oxygen content of the system were found to occur only at extreme salt concentrations and pH values that are most unlikely to occur in practice. It was concluded that the biologic oxidizability of coal-washing plant-generated waste water, and consequently the treatment fees to be paid by coal-washing plants, should not be determined from the unrealistically high COD values obtained by the potassium dichromate method. Wissenschaftliche Zeitschrift der Technischen Universitaet Dresden, Vol. 22, No. 4, p 660-663, 1973. 1 fig, 11 ref.

Descriptors: *Groundwater, *Water management(Applied), Mine water, Mining, Computers, *Model studies, Environmental effects, Europe, Water pollution sources, Forecasting.
Identifiers: Groundwater level rise.

A territory-specific electro-analog model for the forecasting of the renewed groundwater level rise in abandoned surface mines was described, using the example of the Southern Lusatia surface mines. The simulation of the renewed groundwater level rise requires highly precise calculations for regional groundwater flow problems, and exact use of representative system parameters such as permeability and storage coefficients, as well as the location and effectiveness of the recipients, and the rate of groundwater formation. Problems related to the renewed rise of the groundwater levels can be solved by means of analogous electric resistance networks, or numerically by the use of digital computer. Model investigations of the Southern Lusatia surface mining area revealed an initial rapid rise in the groundwater level, followed by subsequent leveling-off due to the interactions between adjacent surface mines. The stationary final state of the groundwater level in abandoned surface mines, without supply from outside sources, is calculated to be reached in 20 to 25 years. Great influence of evaporation on the dynamics of renewed groundwater level rise was established. Model studies of the renewed groundwater level rise in abandoned surface mines are necessary for the planning of the recultivation of such sites and of future water management in such areas. POLLUTION OF A TASMANIAN RIVER BY MINE EFFLUENTS: I. CHEMICAL EVIDENCE,
Tasmania Univ., Hobart (Australia). Dept. of Botany.
P. A. Tyler, and R. T. Buckney.
Int Rev Gesamten Hydrobiol. 58(6), p 873-883, 1973.

Descriptors: Water pollution sources, Discharge(Water), *Water pollution effects, Industrial wastes, Chemical analysis, *Mine water, Mine drainage, Mine wastes, *Australia, *Acid mine water, Zinc, Cadmium, Copper, Lead, Iron, Manganese, Dusts, Tungsten, *Rivers.
Identifiers: Sulfuric acid, Tasmania, Particulates, South Esk River(Tas).

Discharge of effluents from tin and wolfram mines caused severe pollution of 2 creeks and lesser pollution of the South Esk River in North-East Tasmania. The principal pollutants are sulfuric acid, Zn, Cd, Cu, Pb, Fe and Mn in dissolved or particulate form or both. The creek waters were rendered unsuitable for domestic or agricultural use and all normal biota destroyed. In the South Esk River trout are absent from polluted reaches though abundant elsewhere. Flood-borne mine tailings, rich in particulate pollutants, have destroyed or degraded pastures along the South Esk River. (See also W76-07705)--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Arachnida, Hemiptera, Leptocerid trichopterans, South Esk River, Tasmania.

The distribution and abundance of macroinvertebrates were studied in the South Esk River, Tasmania; a river subject to Cd and Zn pollution as a result of mining. The groups most intolerant of Cd-Zn pollution were the Crustacea, Mollusca and Annelida. Highly tolerant groups included aquatic Hemiptera and Arachnida, and larvae of leptocerid trichopterans. A drop in both species diversity and abundance occurred after floods in winter and was probably due to pulses of Cd and Zn down the river and also to increased molar action of the unstable substrate. NON-POINT POLLUTION IN THE POTOMAC RIVER BASIN,
Interstate Commission on the Potomac River, Bethesda, Md.
R. N. Palmer.
ICPRB Tech. Pub. No. 75-2 (June 1975).

Descriptors: *Potomac River, *Watershed management, *River basins, *Water pollution control, *Water management(Applied), Maryland, West Virginia, Virginia, Pennsylvania, District of Columbia, Water pollution source, Water pollution effects, Water pollution treatment, Water quality, Sediment, Bacteria, Nutrients, Abatement, Chemical reactions, Federal government, State governments, Sewers, Costs, Eutrophication, Pollution, Acid mine water.
Identifiers: *Non-point sources(Pollution), *Potomac River Basin, *Acid mine drainage, Retention basins.

This booklet presents an overview of present non-point pollution problems in the Potomac River Basin, including discussion of the magnitude and effect of various pollution sources and abatement techniques. Non-point source pollution control--control of diffuse pollution sources--presents unique difficulties because of extreme quantity variations; consequently, it is necessary in addition to 'point source' control if water quality in this area is to be improved. There are four major non-point sources of pollution: (1) Acid mine drainage originating from coal mine runoff of which the ultimate pollution impact is area sterility. Abatement techniques are 'prevention' and 'treatment'. (2) Sediment pollution from both urban/suburban and rural areas which results from erosion and acid mine drainage, thereby decreasing the usefulness of water and altering the natural river ecology. Abatement approach is regulation by state and local governments. (3) Bacteria pollution originating from treated and untreated sewage and industrial discharge, storm water runoff and combined sewage overflows. Treatment is by separation of combined sewers and construction of retention basins. (4) Increasing nutrient discharge from municipal, agricultural and forest sources advances eutrophication rate presenting problems of water purification. Control centers around advanced waste treatment of point source discharges. (Hadoulias-Florida)

THE DISTRIBUTION OF STIGEOCLONIUM TENUE KUTZ. IN SOUTH WALES IN RELATION TO ITS USE AS AN INDICATOR OF ORGANIC POLLUTION,
University Coll. of Wales, Aberystwyth. Dept. of Botany and Microbiology.
R. O. McLean, and K. Benson-Evans.
Br Phycol J. 9(1), p 83-89, 1974.

Descriptors: Rivers, *Algae, Pollutants, Analysis, *Resistance, Organic wastes, *Bioindicators, Pollutant identification, Path of pollutants, Distribution.
Identifiers: *Stigeoclonium-Tenue Kutz, Wales.

The distribution and frequency of S. tenue Kutz. in some South Wales rivers were studied for 12 mo. to assess the value of the alga as an indicator of organic pollution. It colonized organically polluted areas at most times of the year in greater abundance than at cleaner stations. Tolerance was observed over a wide range for a number of environmental factors: pH, water temperature, suspended solids content, flow nitrate, nitrite and ammonia nitrogen, phosphate phosphorus, dissolved oxygen, BOD (biological oxygen demand), electrical conductivity, chloride, total hardness, magnesium hardness and calcium hardness. Greatest tolerance was expressed mainly in the spring months when the organism became widely distributed in diverse habitats ranging from organically polluted to fairly clean conditions. Some precautions in the use of S. tenue as an indicator of organic pollution are suggested. The frequency of the organism should be noted especially in spring, since organic conditions are suspect only when the alga is highly abundant.--Copyright 1974, Biological Abstracts, Inc.

THE GULF AND THE ESTUARY OF THE SAINT-LAWRENCE RIVER: REVIEW OF THE PRINCIPAL PAPERS ON CHEMICAL OCEANOGRAPHY, (IN FRENCH),
Quebec Univ., Rimouski (Quebec). Dept. of Pure Sciences.
M. Khalil, and M. Arnac.
Rev Int Oceanogr Med 39/40; p 153-170, 1975.

Descriptors: St. Lawrence River, Oceanography, Estuaries, Water circulation, Trace elements, Water pollution sources, Pesticides, Oil wastes.

Intensive biological activities take place in the gulf and estuary of the St. Lawrence River (North America). The water circulation at the basis of any chemical or geochemical study is relatively well known. The composition of the particulate suspended matter in the estuary is richer in trace elements compared to the concentrations of the latter in the earth crust. Major constituents of surface waters collected in the Gaspe current seem to be of the same order of magnitude as the published data for sea-water. The concentrations of trace metals in the estuary and its effluent are of the same order. Where comparision is possible these values for the estuary are generally higher than those for the gulf. Contamination by organochlorine pesticides is not high. Petroleum residue concentrations are not yet at harmful levels.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Storm runoff, *Sewerage, Pollution abatement, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Storm water, Retention, Phosphates, Air pollution, Sewers, Cleaning, Retention, Rainfall-runoff relationships.
Identifiers: Orthophosphate.

Storm runoff pollution measurement in sewer systems conducted in Cincinnati, Ohio; Tulsa, Oklahoma; Ann Arbor, Michigan; and in Oxhey, England, as well as measures for pollution abatement of water bodies have been investigated. The filtrable matter content and dissolved solids content of the rainfall runoff in Tulsa ranged from 84 to 2052 mg/liter and from 89 to 400 mg/liter, respectively. The BOD5 and COD values of the runoff in the four cities were in the ranges of 8-28 mg/liter and 42-138 mg/liter. The soluble orthophosphate content and the organic nitrogen content average 0.54-3.49 mg/liter and 0.36-2.10 mg/liter. This runoff pollutant load can be effectively reduced by intensified street clean-up, especially in March and April, and by global air pollution abatement. A Cincinnati experiment with storm water retention for 10 to 20 minutes in a retention basin gave results concerning (mediocre) pollutional load abatement, (no) effect on bacteria count, and (fairly high) investment and operating costs. The rates of reduction in the BOD5 value, the organic nitrogen, and total phosphate contents achieved after retention of 20 minutes in the four systems were 15, 33, 25, and 8 percent. (Sandoski-FIRL)

POLLUTION OF WATER BODIES BY ARTIFICIAL RUNOFF OF RAINWATER POLLUTION BY WASTE WATER OF MIXED SEWERS (BELASTUNG DER GEWAESSER DURCH KUENSTLICHE ABLEITUNG VON NIEDERSCHLAEGEN. BELASTUNG DURCH ABWAESSER DER MISCHKANALISATION),
K. Krauth.
Berichte der Abwassertechnischen Vereinigung E. V., No. 25, p 97-115, 1973. 5 fig, 11 tab, 11 ref.

Descriptors: *Sewerage, *Storm runoff, Combined sewers, Treatment facilities, Rainfall-runoff relationships, Water storage.
Identifiers: Rain storage basins.

In a two-year test series conducted in West Germany, runoff conditions specifically related to mixed sewer systems were determined during rainfall periods. Quantitative measurements were taken for 621 storm runoff periods with intensities greater than 7 cu ft/sec. Samples were taken of such short intervals that evaluation of the dirt load was feasible. Primary runoffs which flushed entire sewer systems, runoffs which succeeded primary runoffs, and runoffs which partly flushed the sewers, were considered. The results indicate that only temporary storage of the storm runoff and its subsequent purification help to reduce the dirt load. For maintaining a dirt load consistent with that occurring during dry weather, no water may pass the rain storage basin after it has been filled. Under present conditions the dry weather runoff goes directly to the purification plant and the

storm runoff directly to the receiving stream without treatment. (Nave-FIRL)

EVALUATION OF GROUND-WATER CONTAMINATION FROM CLEANING EXPLOSIVE-PROJECTILE CASINGS AT THE BANGOR ANNEX, KITSAP COUNTY, WASHINGTON, PHASE II,
Geological Survey, Tacoma, Wash.
J. V. Tracy, and N. P. Dion.
Water-Resources Investigations 62-75 (open-file report), 1976. 44 p, 8 fig, 3 tab, 13 ref.

Descriptors: *Water pollution sources, *Groundwater, *Waste disposal, *Military reservations, *Washington, Explosives, Leaching, Path of pollutants, Sampling, Water wells, Water analysis, Evaluation, Aquifer characteristics, Public health.
Identifiers: U.S. Navy Bangor Annex(Wash), *Projectile casings waste, TNT, RDX.

From 1966 through 1970 the U.S. Navy steam cleaned explosive-projectile casings at the Bangor Annex, Washington. The condensed waste water, containing explosive residuals, was channeled to a shallow, unlined disposal pit. The waste water recharges a shallow aquifer used for domestic water supplies. Prolonged exposure to the resources reportedly can cause deleterious physiological effects on humans. The Navy obtained the U.S. Geological Survey to make a study of the groundwater conditions. The extent of the contamination of both the groundwater and the earth materials is local, although the earth materials will provide a source of low-level contamination of percolating groundwater for many years. The estimates of TNT and RDX in the earth materials in the disposal pit indicate that very little RDX (300 pounds, 140 kg) remains in the materials and the TNT (9,500 pounds, 4,300 kg) appears to be well adsorbed on the clayey materials. Percolation of rain water over a period of years may slowly leach out the remaining TNT and RDX, but the concentrations of these leachates is not expected to be significantly different from those that currently exist in the groundwater under the disposal area. (Woodard-USGS)

SOLUTE TRANSPORT AND MODELING OF WATER QUALITY IN A SMALL STREAM,
Geological Survey, Menlo Park, Calif.
S. M. Zand, V. C. Kennedy, G. W. Zellweger, and R. J. Avanzino.
Journal of Research of the U. S. Geological Survey, Vol 4, No 2, p 233-240, March-April 1976. 8 fig, 2 tab, 9 ref.

Descriptors: *Path of pollutants, *Tracking techniques, *Water quality, *Streams, Small watersheds, Data collections, Mathematical models, Chlorides, Sodium, Methodology, Analytical techniques.
Identifiers: *Stable strontium, Mass transport.

An injection of chloride, sodium, and stable strontium was made at a constant rate for 3 hours into Uvas Creek, Santa Clara County, Calif., to determine the mass transport processes in a small stream. Five observation points were selected within a 610-meter reach of the stream below the injection site. Water samples were collected at the observation points during and immediately after the injection. A mathematical model of the stream was obtained by solving analytically and optimally the one-dimensional mass transport equation of the solutes in the stream. Comparison of field results with a simplified mathematical model indicates the dominance of convection in the behavior of sodium and chloride. The concentration of chloride and sodium can be closely simulated by the model. However, strontium cannot be well represented by the simplified model, which contains a first-order decay-type sink. Descriptors: *Water quality, *Powerplants, *Condensers, *Cooling, *Thermal pollution, *Water chemistry, Lakes, Rivers, Effects, Nuclear powerplants, Water sampling.
Identifiers: Impurities, Langelier method.

An important feature of a power station is the condenser which is used to condense steam coming out of the turbine. The obvious choice of a coolant for condenser cooling is water; depending on the location of the power station, it can be lake water, river water, or even sea water. For example at the nuclear power stations in India, sea water is used at TAPS and MAPP, while impounded Chambal water from Rana Pratap Sagar dam is used at RAPS. Furthermore, for economic reasons, Pallar river water is proposed for condensor cooling in the fast breeder test reactor coming up at Kalpakkam, even though it is situated on the coast. When lake or river waters are used, apart from the fact that an abundant supply of coolant is assured throughout the year due to geographical and climatic conditions, the other main criteria are the quality of the coolant water and the cost of maintaining the required quality. This paper considers the importance of water quality in condenser cooling and discusses the use of river and lake water. Considered are impurities in water, the effect of impurities, chemical aspects, and other aspects. In view of the fact that nuclear power stations will play a larger role in coming years, the availability of good quality water at inland locations for condenser and other system cooling has to be studied from all angles. 5C. Effects Of Pollution

THE PLIGHT OF THE URBAN RESERVOIR: A CASE STUDY,
Rutgers - The State Univ., New Brunswick, N. J. Water Resources Research Inst.
T. J. Tuffey, and H. Baker.
Water Resources Bulletin, Vol. 11, No. 3, p 575-583, June 1975. 4 fig, 14 ref. OWRT A-043-NJ(1).

Descriptors: *Reservoirs, *Water quality, *Land use, Eutrophication, Phosphorus, Recreation, *New Jersey, Water pollution effects.
Identifiers: *Spruce Run Reservoir(NJ).

This paper details the increasing tendency to overdevelop lands adjacent to public reservoirs. The impact on water quality of the pollutant load carried in surface runoff from developed lands is described, as well as the depreciation in recreational experience due to loss of scenic horizons. The case study, Spruce Run Reservoir in Clinton, New Jersey, included population and demand projection. Land speculation and proposed development are evaluated on a physical constraint basis. Areas of conflict are outlined and conflict resolutions proposed. (Bell-Cornell)

THE ECOLOGICAL BEHAVIOR OF PLUTONIUM AND AMERICIUM IN A FRESHWATER ECOSYSTEM: PHASE II, IMPLICATIONS OF DIFFERENCES IN TRANSURANIC ISOTOPIC RATIOS,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. M. Emery, and T. R. Garland.
Available from the National Technical Information Service, Springfield, Va 22161 as BNWL-1879. $4.00 in paper copy, $2.25 in microfiche. BNWL-1879, December 1974. 26 p, 7 fig, 1 tab, 8 ref. AT(45-1):1830.

Descriptors: *Environmental effects pollution, Radioactivity effects, *Plutonium, *Americium, Freshwater, Waste water(Pollution), Radioisotopes, Ecosystems.
Identifiers: *Transuranics, Ecological behavior.

Transuranics discharged into a freshwater processing waste pond created a complex combination of source terms and isotopic ratios. Relatively large amounts of U238 were released into the pond and, along with unidentified levels of Th232 and Th228 create a problem of interpreting the ecological behavior of Pu and Am in the ecosystem. Ratios of Pu238 to Pu239, Pu240 found in the pond are higher than those in the processing wastewaters released to the pond. Ratios of Pu238 to Pu239, Pu240 and Am241 to Pu239, Pu240 are higher in the pond biota than in the sediments. To a lesser degree ratios of Am241 to Pu238 in the pond biota are also different. The data suggests that sediments in a trench carrying the processing wastes to the pond may be the primary source of Pu and Am. (Chilton-ORNL)

ABUNDANCE, DIVERSITY AND SEASONALITY OF FISHES IN COLORADO LAGOON, ALAMITOS BAY, CALIFORNIA,
California State Univ., Fullerton. Dept. of Biology.
L. G. Allen, and M. H. Horn.
Estuarine and Coastal Marine Science, p 371-380, 1975, Vol 3, 6 fig, 1 tab, 27 ref.

Descriptors: *Fish, Populations, Seasonal, On-site investigations, Temperature, *California, Bays, Seasonal, Lagoons, Killifishes.
Identifiers: Abundance, Diversity, Anchovy, Topsmelt, Shiner surfperch, Staghorn sculpin, California killifish.

The numbers of both fish species and individuals in Colorado Lagoon were highest from May to September and were highly correlated with lagoon temperature which ranged from 12.8 - 25.0 degrees C. 99% of the catch was made up of only four species, northern anchovy, topsmelt, slough anchovy and shiner surfperch. Five species, topsmelt, shiner surfperch, California killifish, staghorn sculpin, and slough anchovy, occurred in wide size ranges and during most of the year and were considered to be residents. Juveniles of northern anchovy were abundant in August and September. (Chilton-ORNL)

THE EFFECT OF DIFFERENT LEVELS OF DIETARY FAT ON THE GROWTH OF RAINBOW TROUT (SALMO GAIRDNERI RICHARDSON),
Stockport Technical Coll., Cheshire (England).
W. D. Atherton.
Journal of Fish Biology, Vol 7, p 565-571, 1975, 4 tab, 29 ref.

Descriptors: *Fish diets, *Growth rates, Feeds, Lipids, *Rainbow trout, Laboratory tests.

Cod liver oil and lard were added to the diet of rainbow trout to investigate the level which would promote the greatest growth at selected temperatures of 12, 16, and 20 degrees C. Data indicated no significant changes in growth rates of fish fed lard at any of the selected temperatures. Levels of 15% or more of cod liver oil added to the diet had an adverse effect on fish at 12 and 16 degrees C. Cod liver oil added at levels of 5 and 10% promoted growth at these temperatures and all fish were affected adversely at 20 degrees C suggesting that the effects were due to temperature rather than dietary factors. (Chilton-ORNL)
W76-07483

A COMPARISON OF THE EFFECTS OF TEMPERATURE ON WOUND HEALING IN A TROPICAL AND A TEMPERATE TELEOST,
Stirling Univ. (Scotland). Unit of Aquatic Pathobiology.
C. D. Anderson, and R. J. Roberts.
Journal of Fish Biology, Vol. 7, p 173-182, 1975, 2 fig, 1 tab, 3 plates, 15 ref.

Descriptors: *Fish, *Laboratory tests, Minnows, Salmon, Temperature, *Teleosts, Thermal effects, *Thermal pollution, Water pollution effect.
Identifiers: Wounds, Healing.

The rate of healing of surgical wounds involving both integument and muscle was studied in two teleost fish. The species chosen were the white mountain cloud minnow (Tanichthyes albonubes) which is a tropical cyprinid and the Atlantic salmon (Salmo salar) which is a temperate anadromous species. Comparisons were made of the rate and quality of wound healing within and between species at temperatures of 5, 10, 23, and 30 degrees C. The rate of wound healing at the tested temperatures increased with increasing temperatures while temperature stress had little effect on the healing rates. (Chilton-ORNL)
W76-07484

THE INFLUENCE OF VARIOUS CULTURE CONDITIONS ON THE OXYGEN CONSUMPTION OF CHANNEL CATFISH,
Georgia Agricultural Experiment Station, Savannah; and Skidaway Inst. of Oceanography, Savannah, Ga.
J. W. Andrews, and Y. Matsuda.
Transactions of the American Fisheries Society, Vol. 104, No. 2, p 322-327, 1975, 3 fig, 26 ref.

Descriptors: *Oxygen requirements, *Fish, *Channel catfish, Environment, Temperature, Weight, Dissolved oxygen, Laboratory tests.
Identifiers: *Oxygen consumption(Fish), Feeding(Fish).

Relationships between oxygen consumption of channel catfish and environmental dissolved oxygen concentrations, feeding status, weight of fish, and temperature were investigated. The rate of oxygen depletion in a still tank with no aeration was used to estimate oxygen consumption. At oxygen concentrations between 1 and 7 milligrams/liter a decrease in oxygen consumption rate with a decrease in environmental oxygen concentration was noted. The highest oxygen consumption rates were obtained one hour after feeding. The relationship between oxygen consumption and environmental temperature was linear over the range of 24-28 degrees C for well-fed fish and 24-30 degrees C for fasted fish. (Chilton-ORNL)

A STUDY OF THE FAUNA IN DREDGED CANALS OF COASTAL LOUISIANA,
Louisiana Wildlife and Fisheries Commission, New Orleans.
G. Adkins, and P. Bowman.
Technical Publication No. 18, February 1976, 72 p, 26 fig, 24 tab, 68 ref.

Descriptors: *Wildlife, *Coasts, *Louisiana, Wetlands, Environment, Dredging, Canals, Salinity, Temperature, Dissolved oxygen, Foods, Freshwater, Sea water, Water chemistry.

Investigations of biological and hydrological parameters associated with artificial wetlands were made in four environments: open, unaltered areas; open canals; semi-open canals; and closed canals. 67,560 individuals representing 88 species were collected. Open, undisturbed areas offered the largest numbers of individuals and closed canals contained the fewest, although organisms in closed canals were larger in size. Salinity ranged from 30.0 to 0.1 parts per thousand, temperatures from 3.6 to 33.9 degrees C. Hydrological conditions were more stable in closed canals than in any of the other environments. Dissolved oxygen remained within tolerance limits of marine organisms during most of the study although some fish kills were seen in semi-open and closed canals. Water chemistry showed a trend of fluctuation dependent upon fresh water and salt water intrusion. Peak levels of nutrients were found after freshwater flooding conditions or storm surges. (Chilton-ORNL)

SOME COMMENTS ON THE THERMAL EFFECTS OF POWER PLANTS ON FISH EGGS AND LARVAE,
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
J. R. Schubel.
In: Fisheries and Energy Production: A Symposium, p 31-54, 1975, 3 fig, 1 tab, 50 ref.

Descriptors: *Thermal pollution, *Water pollution effects, *Entrainment, Fish eggs, Larvae, Stress.

An assessment is made from laboratory studies in which appropriate time-temperature histories have been used and from field studies at operating plants. Actual time-temperature histories depend upon plant design and the characteristics of the receiving waters. Site studies failed to establish the cumulative effects of pressure changes, mechanical agitation and other stresses to which organisms are subjected when carried through steam electric stations with once-through cooling systems. Data from laboratory studies which have been specifically directed at entrainment questions show that blueback herring, alewife, American shad, and striped bass eggs were able to survive exposure to typical time-excess temperature histories of at least 10 degrees C without any harmful effects. Larvae were generally able to withstand temperature increases of 12 degrees C above acclimation temperatures of 5 to 15 degrees C for 40 minutes without significant increases in mortality. ENTRAINMENT OF ORGANISMS AT POWER PLANTS, WITH EMPHASIS ON FISHES - AN OVERVIEW,
NUS Corp., Pittsburgh, Pa. Cyrus Wm. Rice Div.
B. C. Marcy, Jr.
In: Fisheries and Energy Production: A Symposium, p 89-106, 1975 1 tab, 42 ref.

Descriptors: *Entrainment, *Fish, *Powerplants, Fish eggs, Larvae, Environmental effects, Thermal effects, Stress, Intakes.

Available information on entrainment, including the components of inner-plant mortality such as thermal, mechanical and biocidal effects are discussed. Suggestions for reducing entrainment losses are presented. These include siting in nonproductive areas, coordinating plant activities with organism densities, or going to closed cooling systems. The only immediately effective approach to minimize the adverse effect on entrained organisms is believed to be the lower intake volume concept. (See also W76-07487) (Chilton-ORNL)

THE ASSESSMENT OF IMPACT DUE TO ENTRAINMENT OF ICHTHYOPLANKTON,
Stone and Webster Engineering Corp., Boston, Mass. Environmental Engineering Div.
T. J. Horst.
In: Fisheries and Energy Production: A Symposium, p 107-118, 1975. 21 ref.

Descriptors: *Entrainment, *Environmental effects, *Plankton, Fish eggs, Larvae, Populations, Ecosystems, Model studies.

Three approaches to impact assessment are presented. The organism approach estimates the probability of mortality for those organisms which are entrained. The population approach is the impact to fish populations which have egg and larvae stages entrained. The ecosystem approach considers the impact of entrainment to the whole community. The population approach offers the best promise for impact assessment, because models are available which are generally accepted and the impact can be assessed in terms of a basic biological unit, the species population. (See also W76-07487) (Chilton-ORNL)

LABORATORY AND FIELD TEMPERATURE PREFERENCE AND AVOIDANCE DATA OF FISH RELATED TO THE ESTABLISHMENT OF STANDARDS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. R. Stauffer, D. S. Cherry, K. L. Dickson, and J. Cairns Jr.
In: Fisheries and Energy Production: A Symposium. p 119-139, 1975. 8 fig, 29 ref.

Descriptors: *Temperature, *Resistance, *Fish, Laboratory tests, On-site data collections, *Fish behavior, Standards, Thermal pollution.

A relationship was shown between laboratory and field determined temperature preference data for the stoneroller, northern hogsucker, and channel catfish. On the basis of this relationship, temperature responses in situ of the smallmouth bass and spotted bass could be predicted from laboratory data. Temperature preference data of important species indicated that a thermal discharge of 7.7 degrees C higher than ambient temperatures would produce no appreciable harm to maintenance of a viable fish community. The most reasonable approach to establishing thermal standards is to couple temperature preference studies with site specific studies. (See also W76-07487) (Chilton-ORNL)

A LABORATORY STUDY ON THE EFFECTS OF THE EXPOSURE OF SOME ENTRAINABLE HUDSON RIVER BIOTA TO HYDROSTATIC PRESSURE REGIMES CALCULATED FOR THE PROPOSED CORNWALL PUMPED STORAGE PLANT,
New York Univ. Medical Center, N. Y. Inst. of Rehabilitation Medicine.
A. P. Beck, G. V. Poje, and W. T. Waller.
In: Fisheries and Energy Production: A Symposium, p 167-204, 1975. 6 fig, 11 tab, 14 ref.

Descriptors: *Entrainment, *Hydrostatic pressure, Fish, Growth stages, Mortality, Biota, Hudson River.
Identifiers: *Acclimation pressure.

During entrainment, organisms will be exposed to rapid change in velocity shear forces, mechanical buffeting and turbulence as well as to changes in hydrostatic pressure. Based on the current analysis of the pressure regime expected at Cornwall, New York the likelihood of surviving the pressure exposure experienced during entrainment will depend on the life history stage entrained and its acclimation pressure. PERSISTENCE OF DIQUAT IN THE AQUATIC ENVIRONMENT,
Wisconsin Univ., Madison. Water Resources Center.
G. V. Simsiman, and G. Chester.
Water Research, Vol. 10, p. 105-112, 1975. 4 fig., 3 tab., 28 ref. OWRT B-016-WIS(18), 14-01-001-1567

Descriptors: *Pesticide residues, *Persistence, *Diquat, Halogenated pesticides, Herbicides, Biodegradation, Lake sediments, Adsorption, Aquatic plants, *Wisconsin, Lakes.
Identifiers: Lake Mendota(Wis), Lake Tomahawk(Wis).

Following a series of C14 Diquat labeled experiments in weed-infested and weed-free laboratory systems it was noted that although the herbicide has a short residence time in water, a tendency exists for Diquat to accumulate on sediment surfaces either directly or after sorption by aquatic life. The herbicide is released on decay of tissues and is subsequently bound by the sediment. Montmorillonite-adsorbed Diquat persists for longer periods than kaolinite- or vermiculite-adsorbed Diquat. Microbial Diquat degradation was promoted, apparently by rapid proliferation of microorganisms on the decomposing weeds. The clay mineral content of the predominantly montmorillonite contributed to the strong binding between Diquat and the sediment. Although Diquat is microbially degraded, adsorption by montmorillonite makes it less susceptible to breakdown. The persistence of Diquat added to heavily weed-infested aquatic systems is relatively short. In weed-free experiments, the Lake Mendota sediment adsorbed the herbicide almost completely in seven days and was faster in the anaerobic system than in the aerobic system. Microbial degradation of Diquat was noted by cumulative production of C14 labeled carbon dioxide. The higher degree of Diquat degradation in aerobic sediments is an indication that the microorganisms primarily responsible for Diquat breakdown are aerobes; under anaerobic conditions Diquat degradation is slower. (Auen-Wisconsin).

STREAM BOTTOM ORGANISMS AS INDICATORS OF ECOLOGICAL CHANGE: PHASE II,
Lamar Univ., Beaumont, Tex. Dept. of Biology.
R. C. Harrel, and J. L. Duplechin.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 763 $4.50 in paper copy, $2.25 in microfiche. Texas Water Resources Institute, College Station, Completion Report, May, 1976, 49 p, 3 fig, 6 tab, 38 ref. OWRT B-189-TEX(1), 14-31-0001-5116.

Descriptors: *Sewage effluents, Surface runoff, Rice, Irrigation water, Invertebrates, *Bioindicators, *Texas, *Municipal wastes, Benthos, *Bottom organisms, Macrobenthos, *Ecological distribution, Water quality.
Identifiers: Hillebrandt Bayou(Tex.), Limnodrilus hoffmeisteri, Hexagenia limbata.

Effects of municipal sewage effluent, municipal surface runoff, and rice field irrigation water on physicochemical conditions and community structure of benthic macroinvertebrates in Hillebrandt Bayou were studied from September, 1974 to August, 1975. Physicochemical conditions were erratic due to frequent localized precipitation which affected surface runoff and quality and quantity of the sewage discharge. A total of 76 species and 71,178 individuals were collected during the study. Numbers of species per station ranged from 35 to 45. The dominant organism at all stations was Limnodrilus hoffmeisteri. Hexagenia limbata was collected at Station 1, above the sewage outfall, and at Stations 5 through 10. The information theory indices diversity per individual and redundancy, and equitability were used to determine community structure. Annual diversity per individual (d) and equitability (e) decreased at Station 3, located below the sewage outfall, then increased downstream to Station 9 and decreased at Station 10. Annual redundance (R) exhibited the inverse relationship to d and e. On three of six collections d and e decreased at Station 10 due to increased numbers of Hexagenia limbata, a clean water species. Individual collection e values were very erratic. Mathematical indices and physicochemical data alone were not sufficient to evaluate water quality and community stress. However, these data together, correlated with knowledge of the orgaisms, allowed an accurate evaluation. (See also W74-10534)
W76-07586

FISH GROWTH RESPONSE TO MECHANICAL MIXING OF LAKE ARBUCKLE, OKLAHOMA,
Oklahoma Cooperative Fishery Unit, Stillwater.
R. C. Summerfelt, and G. Gebhart.
Available from the National Technical Information Service, Springfield, Va., 22161 as PB-252 762 $5.50 in paper copy, $2.25 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, (1976). 104 p, 12 fig, 44 tab, 28 ref, append, OWRT A-048-OKLA(1), 14-34-0001-6037.

Descriptors: *Reaeration, *Growth rates, Distribution, Drums, Bullheads, Channel catfish, Mixing, Sunfishes, *Oklahoma, Lakes, Fish, Destratification.
Identifiers: *Lake Arbuckle(Okla), *Fish growth, *Mechanical mixing, Gizzard shad.

Fish were sampled from 1973-75 to determine the effect of mechanical mixing of Lake Arbuckle, Oklahoma on the growth rate and depth distribution of gizzard shad, white crappie, freshwater drum, black bullhead and channel catfish. The vertical depth distribution, annual growth rate, instantaneous growth rate, seasonal growth rate and condition factors were determined for the above species. The vertical depth distributions of all species were compressed into the upper water layers by an anoxic hypolimnion during summer stratification and the distributions deepened substantially after fall overturn. No positive conclusions about annual growth rates could be resolved, but it appeared that growth was generally larger in 1974

when the lake was partially mixed than in previous nonmixed years. Seasonal growth rates indicated that generally the major portion of the population growth occurred during the destratified overwinter period rather than the stratified summer period. Condition factors often decreased during the stratified summer interval and increased during the destratified period indicating better fish conditions when the lake was destratified.
W76-07587

COMMUNITY PRODUCTIVITY AND ENERGY FLOW IN AN ENRICHED WARM-WATER STREAM,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
R. L. Vannote, and R. C. Ball.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-242 023, $6.75 in paper copy, $2.25 in microfiche. Report No. MSU-IWR-TR-72-0027 (Technical Report No. 27), September 1972. 166 p. 23 fig., 18 tab., 196 ref. NIH RG-5345-C3

Descriptors: *Energy transfer, *Productivity, *Streams, *Warm-water fish, *Bass, *Energy loss, *Michigan, Crayfish, Eutrophication, Primary productivity, Periphyton, Photosynthesis, Spawning, Standing crops, Aquatic plants, Biomass, Growth rates, Water circulation, Respiration, Dissolved oxygen, Urbanization, Turbidity, Pollutants, Water temperature.
Identifiers: *Red Cedar River(Mich).

Productivity and energetics in the Red Cedar River, Michigan, a smallmouth bass stream, were studied by tracing energy flow patterns and quantifying energy losses from the primary trophic level through the major prey species (crayfish) to bass. Annual primary, macrophyte, and periphyton productivities and photosynthetic efficiencies were calculated. Crayfish were staple items in bass diets and the dominant form of biota. Energy assimilated by crayfish represented 9.4% of energy available at the primary level (0.00527% of incident light energy). Bass nesting density was 21-25 nests/linear stream mile. Postspawning stream conditions determined year class strength. The average bass standing crop was 14.9 kg/ha. Bass production was 13.6 kg/ha/year, representing 0.00024% of incident light energy and 0.14% of net primary production. Assuming crayfish were the only energy source for bass, harvesting efficiency was 14.6% of annual crayfish production. Due to non-assimilated energy losses and energy diverted for body maintenance, 3.6% of crayfish production was used for bass biomass growth. This ecosystem's complex interactions between photosynthesis, circulation, and total community respiration varied according to season and human impact. Further organic enrichment will depress night oxygen levels to a critical level for the stream biota. (Buchanan-Davidson--Wisconsin).

FRESHWATER BIOLOGY AND POLLUTION ECOLOGY: TRAINING MANUAL.
Environmental Protection Agency, Cincinnati, Ohio. Office of Water Programs Operations.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-242 000, $8.00 in paper copy, $2.25 in microfiche. EOA-430/1-75-005, April 1975. 242 p. 95 fig., 17 tab., 312 ref.

Descriptors: *Freshwater, Biology, *Water pollution, *Ecology, *Training, Aquatic algae, Aquatic animals, Aquatic bacteria, Aquatic fungi, Freshwater fish, Plant groupings, Animal groupings, Biological communities, Zooplankton, Waste water, Organic compounds, Periphyton, Invertebrates, Self-purification, Water quality, Estuaries, Toxicity, Bioassay, On-site investigations, Benthos.
Identifiers: *Training manual.

This manual, covering the broad field of freshwater biology and pollution ecology, was designed as an introductory course for sanitary engineers, aquatic biologists, and others concerned with freshwater pollution studies and abatement programs. It includes teaching outlines on the biology and identification of major plant and animal groups, pollution effects, biological pollution indices, and methods of collecting and analyzing freshwater communities. The first section is devoted to surveys of biota. The components of the aquatic community are reviewed to help the observer recognize common types of organisms found in field, laboratory, and treatment facilities. The aquatic environment, production of excess organic matter, and types of algae, macrophytes, animals, microscopic invertebrates of wastewater treatment plants, zooplankton, macroinvertebrates, fish, and fungi are described. The second section discusses pollution ecology: biological aspects of natural self purification, interpretation of biological data with reference to water quality, effects of pollution on aquatic life, global deterioration and the environmental crisis, toxicity bioassays, biological field methods, stream invertebrate drift, artificial substrates, attached growths (periphyton or aufwuchs), application of biological, data, and use of benthic biota for water quality evaluation. (Buchanan-Davidson--Wisconsin).

TAXONOMIC DIFFICULTIES IN RED TIDE AND PARALYTIC SHELLFISH POISON STUDIES: THE 'TAMARENSIS COMPLEX' OF CONYAULAX,
British Columbia Univ., Vancouver. Inst. of Oceanography.
F. J. R. Taylor.
Environmental Letters, Vol. 9, No. 2, p. 103-119, 1975. 10 fig., 1 tab., 24 ref.

Descriptors: *Systematics, *Red tide, Toxicity, Dinoflagellates, Atlantic ocean, Pacific Ocean, Plant physiology, Plant morphology.
Identifiers: *Gonyaulax, *Gonyaulax tamarensis, Thecal morphology, Gonyaulax excavata, Gonyaulax phoneus, Gonyaulax acatenella, Gonyaulax fratercula, Gonyaulax conjuncta, Gonyaulax catenella, Gonyaulax cohorticula, Gonyaulax series.

At least three species of the dinoflagellate genus Gonyaulax form similar potent neurotoxins, but their recognition is confused. The history of the problem is described. Gonyaulax tamarensis type illustrations contained an apparent reversal of epithecal plates and cultures from the type locality were not toxigenic, thus allocation of toxic populations in the North Atlantic to this species or a variety (var. excavata) is doubtful. The latter was designated as a distinct species, but given the wrong name (G. excavata) instead of G. phoneus. Criteria for recognizing other similar species are summarized. Variability in plate patterns observed in cultures of G. tamarensis var. excavata from British Columbia is demonstrated, and its bearing on Gonyaulax taxonomy is discussed. Finding this toxic variety on the west coast of North America is new. Emphasis should not be placed on small differences in shape or size of certain plates unless little variability is observed. Studies are needed on species distribution, variability thecal morphology, and physiological properties. At least three toxic taxa appear on the west coast. Toxic populations of G. tamarensis appear to be var. excavata. If it is a distinct species, it should not be identified as G. excavata but as G. phoneus. (Buchanan-Davidson--Wisconsin).
W76-07614

THE 1971 RED TIDE AND ITS IMPACT ON CERTAIN REEF COMMUNITIES IN THE MID-EASTERN GULF OF MEXICO,
Florida Dept. of Natural Resources, St. Petersburg, Marine Research Lab.
G. B. Smith.
Environmental Letters, Vol. 9, No. 2, p. 141-152, 1975. 1 fig., 1 tab., 16 ref.

Descriptors: *Red tide, *Reefs, *Biological communities, *Mortality, *Gulf of Mexico, Florida, Succession, On-site investigations, Fishes, Coral, Mollusks, Crustaceans, Annelids, Benthic flora, Benthic fauna, Oxygen sag, Gymnodinium, Turbidity, Thermocline, Hypolimnion, Environmental effects.
Identifiers: *Ecological impact.

The effects of the 1971 spring-summer red tide on mid-eastern Gulf of Mexico patch reef communities are described, based on in situ SCUBA observations at scattered sites off Sarasota, Florida. Reef fishes, acleractinian and alcyonarian corals, mollusks, decapod crustaceans, polychaetous annelids, tunicates, poriferans, echinoderms, and benthic algae sustained heavy mortalities, although mortalities of benthic reef invertebrates may not have been due to Gymnodinium breve toxins but to secondary effects (oxygen depletion, hydrogen sulfide poisoning, bacterial and fungal infections). Under proper environmental conditions, red tides can cause almost complete destruction of shallow-water reef biotas from large areas of the inner central-West Florida Shelf. Recolonization by certain biotic groups (benthic algae and fishes) is relatively rapid, but that of others (scleractinian and alcyonarian corals and echinoderms) may require several years. Seasonal and true ecological progression after certain red tides may temporarily cause floral and faunal assemblages to be qualitatively and quantitatively different from those prior to the red tide. Red tides, especially those generated beneath pronounced thermoclines, may regulate the composition, abundance, and distribution of shallow-water reef biotas in mid-eastern Gulf of Mexico. Periodic occurrence of red tides may prevent evolution of climax or equilibrium reef communities. (Buchanan-Davidson--Wisconsin).

LAND DRAINAGE AS A FACTOR IN 'RED TIDE' DEVELOPMENT,
Department of the Environment, Ottawa (Ontario). Shellfish Water Quality Div.
A. Prakash.
Environmental Letters, Vol. 9, No. 2, p. 121-128, 1975. 20 ref.

Descriptors: *Surface drainage, *Dinoflagellates, *Red tide, *Environmental effects, Growth rates, Coasts, Salinity, Pollutants, Trace elements, Humus, Productivity, Organic matter.
Identifiers: Gonyaulax.

The mechanisms and factors involved in the development of red tides are not completely understood, but coastal red tides are primarily caused by a spectacular growth of marine dinoflagellates. Generally marine dinoflagellates thrive best under conditions of low salinity and high organic enrichment, conditions especially found in areas of river discharge and/or after heavy rainfalls. Indirect evidence suggests that heavy rainfall or land drainage is a prerequisite to most dinoflagellate blooms in coastal waters. Most marine dinoflagellates in laboratory cultures show optimal growth in salinities much below those of coastal waters. Land drainage lowers salinity of coastal waters and contributes to stratification, photic zone stability, convergence, and other mechanisms which may influence or control dinoflagellate growth. Biologically active substances, such as vitamins, chelators, antibiotics, auxins, decomposition products, extracellular metabolites, and humic compounds, are important factors in phytoplankton productivity. There is ex-

perimental evidence that humic substances exert a stimulatory effect on marine dinoflagellates and that maximum growth responses are generated by predominantly low molecular weight, water soluble humic fractions; consequently humus-laden runoff could create conditions conducive to red tide development. Sewage outfall discharges containing organic material may also create conditions favorable to dinoflagellate growth and development of red tides. (Buchanan-Davidson--Wisconsin)
W76-07616

SOME OF THE GROWTH CHARACTERISTICS OF GONYAULAX TAMARENSIS ISOLATED FROM THE GULF OF MAINE,
Salem State College, Mass. Dept. of Biology.
E. J. Cole, C. M. Yentsch, C. S. Yentsch, and M. Salvaggio.
Environmental Letters, Vol. 9, No. 2, p. 153-166, 1975. 5 fig., 13 ref.

Descriptors: *Red tide, *Growth rates, *Nuisance algae, *Gulfs, Light intensity, Maine, Water temperature, Chlorophyll, Cultures, Nitrates, Marine algae, Temperate, Canada, Dinoflagellates.
Identifiers: *Gonyaulax tamarensis, Dunnaliella, Phaeodactylum, *Gulf of Maine.

Gonyaulax tamarensis isolated from the Gulf of Maine during a red tide outbreak in September 1972 was studied. Light saturation curves were characteristic of shade species, and it is not unique in its capacity to use light. Optimal growth occurred at 18C. Encystment and no net growth were characteristic at 5C. Division rates were less and chlorophyll concentrations only slightly above those observed in 1972 bloom. The major difference in growth between axenic and non-axenic cultures was the long lag in axenic cultures; after three weeks the growth rates were almost identical. Changes in nitrate consumption correlated inversely with changes in chlorophyll. No marked low nitrogen requirement was observed compared to Dunaliella and Phaeodactylum. Similar chlorophyll levels/unit nitrate were found in Gonyaulax and Phaeodactylum, which had about half as much chlorophyll/unit nitrate as Dunaliella. Gonyaulax was a typical temperate phytoplankton and responded much like other phytoplankton to the parameters tested; its responses were identical to those of a Canadian Gonyaulax. The seed source may have come from Northern to Southern Gulf of Maine waters but not from an independent race. Several conjectures for the dominance of G. tamarensis at the time of the outbreak are discussed. (Buchanan-Davidson--Wisconsin).

REPORT ON A BIOCHEMICAL RED TIDE REPRESSIVE AGENT,
University of South Florida, Tampa. Dept. of Chemistry.
E. C. Kutt, and D. F. Martin.
Environmental Letters, Vol. 9, No. 2, p. 195-208, 1975. 3 fig., 3 tab., 18 ref.

Descriptors: *Chemcontrol, *Biocontrol, *Red tide, *Gymnodinium, Estuaries, Nuisance algae, *Florida, Economic impact, Predation, Cyanophyta, Fish toxins, Algal toxins, Nutrient requirements, Biodegradation, Dispersion, Gulf of Mexico, Coasts.
Identifiers: *Gymnodinium breve, Tintinnids, Gomphosphaeria aponina.

Estuarine red tides caused by definite species tend to occur yearly at specific times off the Florida coast; whether they spread and develop into catastrophic blooms depends on availability of a suitable environment and/or absence of competing or predator organisms. Naturally occurring organisms promising for red tide control are, in cool waters, a ciliate Tintinnid which grazes on red tide organisms and in warm waters, the cyanophyle Gomphosphaeria aponina, which inhibits Gymnodinium breve growth and excretes a toxic substance (aponin). Gomphosphaeria grows rapidly. Its deleterious effect on Gymnodinium is probably not due to nutrient depletion but may be due to biochemical interrelations, such as environmental regulation by external metabolite production. The aponin caused up to 95% Gymnodinium mortality. Fish showed extensive gill ruddiness and died in 24 hours. The effects of salinity, temperature dependence, and nutrition on Gomphosphaeria must be studied. Stability, degree of non-absorptiveness, resistance to biodegradation, and capacity of the watermass to minimize dispersion of metabolites must be considered. Treatment of small areas with biochemical agents could prevent major blooms. If treatment of areas where red tides are first detected is followed by concentration by the same forces which concentrate Gymnodinium, red tides might not be a threat. (Buchanan-Davidson--Wisconsin).
W76-07618

IMPLICATIONS OF DINOFLAGELLATE LIFE CYCLES ON INITIATION OF GYMNODINIUM BREVE RED TIDES,
Florida Dept. of Natural Resources, St. Petersburg. Marine Research Lab.
K. A. Steidinger.
Environmental Letters, Vol. 9, No. 2, p. 129-139, 1975. 2 tab., 50 ref.

Descriptors: *Dinoflagellates, *Gymnodinium, *Red tide, *Life cycles, *Diapause, Florida, Growth stages, Estuaries, Coasts, Germination, Dormancy, Life history studies, Reproduction, Temperature, Environmental effects, Varieties, Gulf of Mexico.
Identifiers: Sexual reproduction, Offshore, Benthic resting cyst stages.

Knowledge of benthic and pelagic stages in life cycles is needed to understand dinoflagellate distribution, seasonal growth patterns, and succession in coastal and estuarine waters. Ten dinoflagellate life cycles are known to include fertilization and formation of pelagic motile and nonmotile or benthic nonmotile zygotes. Knowledge concerning germination, dormancy, and sexuality is reviewed. Copulation may occur at specific cell surface sites. Sexual reproduction is slow, occurs at specific times in the life cycle, and can proceed undetected. Some dinoflagellates have resting cysts (dormant stages, often with thick walls). Temperature may be the key environmental factor in excystment. Species with and without armored cysts are listed. Cysts may be zygotes, dormant, or form seed populations. Gymnodinium breve red tides along Florida's west coast usually begin 18-74 km offshore but can be brought shoreward, depending on currents, winds, and cell longevity. Initial blooms are localized, suggesting existence of seed beds. If Gymnodinium breve has a benthic resting stage, seed populations or seed beds might be mapped. Further life cycle studies on differences in morphological and/or cytological generations, length of dormancy, and factors influencing encystment and excystment on Gymnodinium breve and other dinoflagellates associated with red tides would contribute to control measures. (Buchanan-Davidson--Wisconsin).
W76-07619

AN ANALYTICAL STUDY OF THE ROLE OF VARIOUS FACTORS CAUSING RED TIDE OUTBREAKS OF TRICHODISMIUM AS DEDUCED FROM FIELD AND LABORATORY OBSERVATION,
V. C. Ramamurthy.
Environmental Letters, Vol. 9, No. 2, p. 179-193, 1975. 4 fig., 1 tab., 28 ref.

Descriptors: *Red tide, *Marine algae, Subtropic, Fish food organisms, Nutrient requirements, *Cyanophyta, Beneficial use, Nitrates, Phosphates, Growth rates, Nitrogen fixation.
Identifiers: *Trichodesmium erythraeum, Gibberellic acid.

The marine blue green alga Trichodesmium is often found during red tides in sub-tropical areas. Fish mortality during Trichodesmium outbreaks may be due to asphyxiation rather than toxins, as it is an important fish food source. Trichodesmium outbreaks are also new nitrogen sources to the nitrogen demand of tropical oceans. When the effect of gibberellic acid on Trichodesmium erythraeum and the diatom Melosira sulcata cell multiplication was studied, there was an increase in cell population density as a function of gibberellic acid concentration to a maximum level. Gibberellic acid accelerated cell division, reducing the interval between successive divisions. One causative factor of red tides may be the presence of growth-promoting substances, rather than upwelling or rainfall. Red tides appear in the warmest seasons during periods of light winds. Trichodesmium cultures were not markedly affected by increasing nitrate or phosphate concentrations above normal levels. When the phosphate concentration was decreased below normal, the cells began to disintegrate and decompose; when the nitrate concentration was decreased, the cells remained viable but failed to multiply. In nitrogen-free media, cell multiplication in terms of nitrogen fixation increased rapidly. Trichodesmium erythraeum thrives and multiplies in nitrogen-impoverished waters. When and where red tides will occur cannot be predicted. (Buchanan-Davidson--Wisconsin)

OCCURRENCE OF FORAMINIFERA, MOLLUSCS AND OSTRACODS ADJACENT TO THE INDUSTRIALIZED SHORELINE OF CANSO STRAIT, NOVA SCOTIA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia).
C. T. Schafer, F. J. E. Wagner, and C. Ferguson.
Water, Air and Soil Pollution, Vol. 5, No. 1, p. 79-96, 1975. 10 fig., 2 tab., 20 ref.

Descriptors: Marine animals, *Bioindicators, *Crustaceans, *Distribution patterns, *Water pollution effects, *Mollusks, *Canada, Industrial wastes, Snails, Straits, Sea water, Metals, Trace elements, Varieties, Bottom sediments, Copper, Iron, Manganese, Zinc, Carbon.
Identifiers: *Foraminifera, *Ostracods, Canso Strait(Nova Scotia).

Distributions and relationships between foraminifera, molluscs, and ostracods in moderately polluted portions of Canso Strait, Nova Scotia, showed high, moderate, and low tolerances to industrial effluents, respectively. Particulate matter near the industrialized shore contained adsorbed and complexed trace metals. Maps of species distributions and trace metal concentrations indicated that contaminated surface water movement was usually southward. Sediment particle size was controlled by water depth except near the industrialized shore where bottom sediments were characterized by anomalous copper, iron, manganese, zinc, and organic carbon concentrations. Foraminifera productivity was low near the industrialized shore and high in shallow environments where sediments contained 0.5 to 1.0% organic carbon. Foraminifera species diversity and abundance correlated with bottom sediment zinc levels. Pollutant stressed environments contained large numbers of the foraminifer Eggerella advena, Elphidium incertum/clavatum group, the mollusc Modiolus modiolus, and ostracods including Baffinicythere emarginata and Muellerina canadensis. Biological and chemical parameters were used to formulate pollution indices. The area between the foraminifer and ostracod barren zones edges defined a polluted but inhabitable subnormal zone. (Buchanan-Davidson--Wisconsin).

LIGHT DEPENDENT DDT-EFFECT ON MICROALGAE, (IN GERMAN),
Technische Universitaet, Freising-Weihenstephan (West Germany).

H. Witsch, A. Munz, and C. Scheibe.
Beriche der Deutschen Botanischen Gesselschaft, Vol. 88, No. 2, p. 191-196, 1975. 1 fig., 9 ref.

Descriptors: *Algae, *Pesticide toxicity, *DDT, Light intensity, Algal control, Resistance, Water pollution effects, Environmental effects.
Identifiers: Microcystis aeruginosa, Coelastrum proboscideum.

The dry weight increase in (mg/100 ml) cultures of the algae Microcystis aeruginosa and Coelastrum proboscideum were measured in relation to the influence of DDT and on initial light-shocks of various intensities. High light-energy alone remarkably depressed growth of Microcystis aeruginosa and increasing light intensity also enhanced its sensitivity to DDT. Coelastrum proboscideum was largely insensitive to radiation as well as to the combination of light and DDT. It is stressed that data on the sensitivity or tolerance of an algal species to DDT must include all variables, or must specifically define conditions, because additional factors strongly influence these reactions. (Auen-Wisconsin).

CHARACTERIZATION OF LIMNETIC ZOOPLANKTON PHOSPHORUS EXCRETION AND FACTORS AFFECTING TEMPORAL EXCRETION RATES IN THE PHOSPHORUS CYCLE IN A LAKE,
New Hampshire Univ., Durham. Dept. of Zoology.
J. G. Ferrante.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-252 857, $5.00 in paper copy, $2.25 in microfiche. PhD thesis, September 1974. 69 p. 12 fig., 8 tab., 57 ref. OWRT A-029-NH (2).

Descriptors: *Cycling nutrients, *Zooplankton, *Phosphorus, Seston, Hypolimnion, Epilimnion, *New Hampshire, Absorption, Model studies, Organophosphorus compounds, Solubility.
Identifiers: *Phosphorus excretion, Stonehouse Pond(NH), Orthophosphates.

Temporal and spatial excretion rates were studied by determining changes in soluble reactive phosphorus following incubation of zooplankton (smaller or larger than 0.308 mm) collected from the epilimnion and hypolimnion of Stonehouse Pond, New Hampshire. Temporal excretion rates varied within size groups; similar patterns were observed in both strata. Excretion rates were high in spring and fall and low in winter. Smaller animals excreted at higher rates. Excretion rates were higher by animals in the epilimnion compared to the hypolimnion. Phosphorus uptake by natural seston was compared to the amount released by zooplankton. In the spring of 1973, excretion rates increased but were offset by greater increases in the phosphorus uptake rate by seston, suggesting that at this time zooplankton phosphorus excretions were not enough to supply the amount of phosphorus being removed by seston. Phosphorus excretion studies of zooplankton collected in the spring of 1974 showed that the soluble phosphorus component released from natural populations had the same molecular weight as orthophosphate and behaved similarly in seston incorporation studies. Approximately 15% of total phosphorus was organic but could not be identified by ultraviolet spectroscopy. There was no evidence of nucleic acid excretion or hydrolytic degradation products. (Buchanan-Davidson--Wisconsin).

AN OUTBREAK OF SHIGELLA SONNEI GASTROENTERITIS ON COLORADO RIVER RAFT TRIPS,
Center for Disease Control, Atlanta, Ga.
M. H. Merson, D. A. Goldman, K. M. Boyer, N. J. Peterson, and C. Patton.
Am J Epidemiol. 100(3), p 186-196, 1974.

Descriptors: *Colorado River, *Human diseases, Public health, *Shigella, Enteric bacteria, Water analysis, Bacteriology, Chemical analysis, Waste disposal.
Identifiers: Rafts, Shigella-Sonnei.

In the summer of 1972 an outbreak of acute gastroenteritis occurred among passengers and boatmen on Colorado River raft trips. The illness was characterized by diarrhea, abdominal cramps, and fever. Laboratory results indicated that the outbreak was caused by S. sonnei. The illness originated among the boatmen and spread to passengers primarily by person-to-person transmission. No common food or water vehicle could be identified as the source of the outbreak. A bacteriologic and chemical analysis of water from the Colorado River and some of its tributaries demonstrated that this water is unsuitable for drinking unless purified. The Colorado River Health Committee was created to establish guidelines for food and water handling and sewage disposal aboard the rafts and to initiate a health training course for boatmen.--Copyright 1975, Biological Abstracts, Inc.

BIOLOGICAL AVAILABILITY OF MERCURY IN SWORDFISH (XIPHIAS GLADIUS),
Nabisco Research and Development Center, Fair Lawn, N. J.
B. R. Stillings, and H. R. Lagally.
Nutr Rep Int. 10(5), p 261-267, 1974.

Descriptors: *Mercury, Fish, Chlorides, Rodents, Absorption, Biology, Bioassay, Biochemistry.
Identifiers: *Swordfish, Xiphias-Gladius, Methylmercuric chloride.

In a study with weanling rats, the biological availability of Hg in swordfish was compared to that in methylmercuric chloride. Rats fed swordfish excreted significantly more Hg and retained slightly less in tissues. The biological availability of Hg in swordfish is slightly lower than that in methylmercuric chloride.--Copyright 1975, Biological Abstracts, Inc.

AN ENZOOTIC NUCLEAR POLYHEDROSIS VIRUS OF PINK SHRIMP: ULTRASTRUCTURE, PREVALENCE, AND ENHANCEMENT,
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Environmental Research Lab.
J. A. Couch.
J Invertebr Pathol. 24(3), p 311-331, 1974.

Descriptors: *Viruses, Shrimp, *Pink shrimp, Biology, Gulf of Mexico, *Cytological studies.
Identifiers: Baculovirus, *Enzootic nuclear polyhedrosis virsus, Penaei, Penaeus-Duorarum.

A nuclear polyhedrosis virus exists in pink shrimp, Penaeus duorarum, from waters of the northern Gulf of Mexico. This virus is rod-shaped, 269 nm long and possesses an outer envelope surrounding its nucleocapsid. The nucleocapsid is 50 nm in diameter. The virus occurs in nuclei of host hepatopancreatic and midgut cells and is both free in the nucleus and occluded within pyramidal-shaped polyhedral inclusion bodies (PIB's). Histochemically and ultrastructurally, the shrimp PIB's appear to be ribonucleoprotein and in fine structure bear close resemblance to polyhedral inclusion bodies of Baculovirus species from insects. The lattice line-to-line spacing is greater than that usually reported for insect PIB's. Crowding, chemical stress of shrimp in aquaria may enhance and increase the virus infection and prevalence. In limited experiments, shrimp fed heavily infected hepatopancreatic tissues had much higher mortality than controls fed only fish. The virus appears to be enzootic in pink shrimp, in nature. Cytopathological changes in infected cells of shrimp appear similar to those in insects infected with certain species Baculovirus penaei n. sp. is proposed for the shrimp virus.--Copyright 1975, Biological Abstracts, Inc.

ORGANOCHLORINE PESTICIDE RESIDUES IN CULTURED FISHES OF TAIWAN,
Academia Sinica, Taipei (Taiwan). Inst. of Zoology.
S. S. Jeng, and L. T. Sun.
Bull Inst Zool Acad Sin Taipei. 13(1), p 37-46, 1974.

Descriptors: Pesticide residues, Fish, Asia, Shellfish, Oysters, Clams, Gas chromatography, Pollutant identification, DDT, Aldrin, Endrin, Dieldrin, Heptachlor, Pollutant identification.

The 1st report on organochlorine pesticide residues in cultured fishes and shellfishes of Taiwan suggests that the aquatic animals are not contaminated by pesticides. From Sept. 1972-Sept. 1973, 167 fishes belonging to 5 spp., 631 oysters and 20 clams were analyzed. No aldrin, endrin, heptachlor and heptachlor epoxide were detected within the sensitivity limit of the gas chromatographic method in all the fish and shellfish examined. Small residues of the BHC group were present in almost all the fish and shellfish with the maximum value not higher than 0.16 ppm in fish muscle or viscera. Also present in the edible portions of the fish and oysters were small amounts of DDT group compounds with values less than 0.15 ppm. DDT and its metabolites were not detected in clams. An insignificant amount of dieldrin (less than 0.05 ppm) was found in fish. The use of organochlorine pesticides in the past 20 yr did not result in significant accumulations of organochlorine pesticides in the fishes and shellfishes to render them unsuitable for human consumption.--Copyright 1975, Biological Abstracts, Inc.

TOXICITY OF INSECTICIDES (COMMERCIAL FORMULATIONS) TO THE EXOTIC FISH, COMMON CARP CYRPINUS CARPIO COMMUNIS LINNAEUS,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Zoology-Entomology.
H. S. Toor, K. Mehta, and S. Chhina.
J Res Punjab Agric Univ. 10(3), p 341-345, 1973.

Descriptors: *Insecticides, *Toxicity, *Fish, *Carp, *Water pollution effects, Endrin, Resistance.
Identifiers: Cyprinus-Carpio-Communis, Dimethoate, Endosulfan, Malathion, Exotic fish.

The tests were conducted to determine the toxic effects (relevant to environmental pollution) of endrin, endosulfan, dimethoate and malathion. Emulsions of these insecticides were tested against small specimens measuring 7.5 to 10.5 cm. Endrin proved to be the most toxic, followed by endosulfan, malathion and dimethoate. The threshold toxicity and the maximum sublethal doses for the endrin were 0.003 and 0.0018 ppm respectively. For endosulfan, they were 0.007 and 0.0050 ppm; for malathion, they were 20 and 17 ppm, and for dimethoate they were 40 and 45 ppm respectively. The physical reactions of the fish poisoned with these insecticides were studied. The fish exhibited wild swimming, excitation and loss of equilibrium. Ultimately, they sank to the bottom of the water and died.--Copyright 1974, Biological Abstracts, Inc.

TOXICITY BIOASSAYS OF CADMIUM ON SELECTED FRESHWATER INVERTEBRATES AND THE INTERACTION OF CADMIUM AND ZINC ON THE FRESHWATER SHRIMP, PARATYA TASMANIENSIS RIEK,
Adelaide Univ. (Australia). Dept. of Zoology.
V. J. Thorp, and P. S. Lake.
Aust J Mar Freshwater Res. 25(1), p 97-104, 1974.

Descriptors: *Bioassay, *Toxicity, Invertebrates, Freshwater fish, Resistance, Seasonal, *Cadmium, *Sulfates, *Shrimp, *Australia.
Identifiers: Atalophlebia-Australis, Austrochiltonia-Subtenuis, Ischnura-Heterosticta, Leptoceridae, Paratya-Tasmaniensis, Shrimp, Tasmania.

In acute toxicity bioassays with cadmium sulfate at 15 degrees C in soft water (total hardness 10 mg/l as calcium carbonate), the concentrations fatal to 50% of the test animals were determined for 5 freshwater invertebrate species. The 96 h median lethal concentration (LC50) of Cd was 0.04 mg/l for the amphipod Austrochiltonia subtenuis Sayce, 0.06 mg/l for the shrimp Paratya tasmaniensis Riek, 0.84 mg/l for the ephemeropteran nymph Atalophlebia australis Walker, 250 mg/l for the zygopteran nymph Ischnura heterosticta (Burmeister) and well over 2000 mg/l for a trichopteran larva of the Leptoceridae. The bioassays on Paratya indicated that there may be seasonal differences in sensitivity to Cd. The 96 h LC50 for Xn for Paratya was 1.21 mg/l. Zn and Cd appeared to interact less than additively at concentrations below 1 toxic unit. Above this concentration, their interaction was strictly additive.--Copyright 1974, Biological Abstracts, Inc.

ULTRASTRUCTURAL CHANGES INDUCED BY LOW CONCENTRATIONS OF DDT IN THE LIVERS OF THE ZEBRAFISH AND THE GUPPY,
New Jersey School of Medicine, Newark. Dept. of Anatomy.
P. Weis.
Chem-Biol Interactions. 8(1), p 25-30, 1974.

Descriptors: *Fish, *DDT, Effects, Insecticides, Pesticides, *Fish diseases, Fish physiology, *Resistance, Pollutants, Toxins, *Water pollution effects.
Identifiers: Brachydanio-Rerio, Guppies, Livers, Poecilia-Reticulata, Tolerance, *Zebrafish.

Following exposure to 0.3-3.0 ppb DDT, the livers of zebrafish (Brachydanio rerio) and guppies (Poecilia reticulata) were examined by electron microscopy. After 24 h in 1.0 ppb or 72 h in 0.3 ppb, zebrafish had a complete loss of glycogen, decrease in cell size and a cytoplasmic compartment filled with rough endoplasmic reticulum (ER). Guppies exposed for periods of up to 28 days showed only a gradual accumulation of smooth ER and no change in glycogen, lipid, rough ER or cell size. The relationship of these changes to the zebrafish's sensitivity and the guppy's tolerance to DDT is discussed.--Copyright 1974, Biological Abstracts, Inc.

STUDIES OF TOLERANCE TO HEAVY METALS IN THE FLORA OF THE RIVERS YSTWYTH AND CLARACH, WALES,
University Coll. of Wales, Aberystwyth. Dept. of Botany and Microbiology.
R. O. McLean, and A. K. Jones.
Freshwater Biology, Vol. 5, p. 431-444, 1975. 6 fig., 8 tab., 31 ref.

Descriptors: *Algae, Water pollution effects, *Heavy metals, *Bioindicators, Lead, Iron, Zinc, Copper, Manganese, *Absorption, *Diatoms, *Chlorophyta, *Resistance, Zinc radioisotopes, Tracers, Water quality control, Environmental effects, Laboratory tests, On-site investigations, Rivers, Analytical techniques, Plant populations.
Identifiers: *River Ystwyth(Wales), *River Clarach(Wales), Bioaccumulation, Hormidium spp, Scapania, Fontinalis.

A survey of the river Ystwyth demonstrated metal pollution, especially below old lead miles. Hormidium spp. were the most tolerant filamentous green algae. Scapania undulata was a tolerant bryophyte in the Ystwyth and Clarach rivers. It was found alone in polluted sites and less frequently in cleaner areas. Metal extracts of S. undulata showed variation in metal concentrations of the environment to some extent. Lower levels of Fe, Pb and Mn were found in Scapania than in the less tolerant Fontinalis squamosa, which died 18 weeks after transplantation to polluted sites. Zn 65 tracing experiments showed that both plants had similar uptake patterns for the metal, but that the amount taken up was slightly higher in the less tolerant Fontinalis. Diatom flora varied according to degree of pollution in an area. (Katz)

FLUORESCENT WHITENING AGENTS: ACUTE FISH TOXICITY AND ACCUMULATION STUDIES,
Procter and Gamble Co., Cincinnati, Ohio. Environmental Water Quality Research Dept.
R. N. Sturm, K. E. Williams, and K. S. Macek.
Water Research, Vol. 9, No. 2, p. 211-219, February, 1975. 5 fig., 4 tab., 4 ref.

Descriptors: Laboratory tests, *Sunfishes, *Channel catfish, *Bioassay, *Toxicity, Water pollution sources, *Detergents, *Anions, *Absorption, Organic compounds, Methodology, Analytical techniques, Pollutant identification.
Identifiers: Bioaccumulation, *Fluorescent whitening agents, Tissue analysis.

Four fluorescent whitening agents (FWA) were tested to determine their acute toxicity to the bluegill (Lepomis macrochirus) as well as their potential for accumulation in the flesh of the bluegill and channel catfish (Ictalurus punctatus). Results of acute toxicity bioassays showed no acutely toxic effects on fish at levels well above projected environmental levels. Rates and maximum levels of accumulation were evaluated in the laboratory for 90-105 days, followed by 28-day examination of the rate of elimination. Neither species accumulated any of three anionic fluorescent whitening agents when exposed to concentrations of 0.125, 1.25 or 12.5 micrograms/liter. A nonionic FWA not currently used in U.S. detergents was accumulated at the two highest concentrations and was completely eliminated by fish after 14 days in water devoid of the chemical. No significant accumulation of any FWA by fish was observed at levels approximating projected environmental concentrations. (Katz)

TEMPERATURE SELECTION IN BROOK TROUT (SALVELINUS FONTINALIS) FOLLOWING EXPOSURE TO DDT, PCB OR PHENOL,
University of Western Ontario, London. Dept. of Zoology.
D. L. Miller, and D. M. Ogilvie.
Bulletin of Environmental Contamination and Toxicology, Vol. 14, No. 5, p. 545-551, 1975. 4 fig., 10 ref.

Descriptors: *Pesticides, Water pollution effects, Laboratory tests, *Temperature, *DDT, *Polychlorinated biphenyls, *Brook trout, Environmental effects, *Toxicity, *Phenols, Lethal limit, Mortality, Fish behavior, Thermocline, Trout, Toxicants, Chlorinated hydrocarbon pesticides.
Identifiers: Sublethal effects.

Brook trout were exposed for 24 hours to DDT (10 to 50 ppb), phenol (0.75 to 10 ppm), or PCB (25 to 100 ppm). Following this exposure, the fish were placed in a temperature gradient apparatus in order to determine the effect of these pesticides on temperature selection. Fish exposed to the lowest dose of DDT (10 ppb) selected lower temperatures than control fish, whereas the highest dose (50 ppb) increased the selected temperature. The 24 hour LD50 was estimated at 54 ppb. Exposure to phenol produced a downward shift in selected temperature. The 24 hour LD50 was estimated at 11.7 ppm for phenol. No level of PCB tested had an effect on selected temperatures of brook trout. Despite the chemical similarity of DDT and PCB, it appears that PCB is less toxic than DDT and does not alter the thermoregulatory behavior of fish as does DDT. (Katz)
W76-07714

DECHLORINATION OF MUNICIPAL SEWAGE USING SULFUR DIOXIDE,
International Pacific Salmon Fisheries Commission, New Westminster (British Columbia).
D. W. Martens, and J. A. Servizi.
Progress Report No. 32, 1975. 24 p., 1 fig., 8 tab., 26 ref.

Descriptors: *Bioassay, *Toxicity, Municipal wastes, *Chlorination, Sewage treatment, Quality control, *Sulfur compounds , *Mortality, *Pink salmon, *Sockeye salmon, Sewage lagoons, Laboratory tests, Analytical techniques, Lethal limit, Dissolved oxygen, Hydrogen ion concentration, Methodology, Disinfection, Water treatment, Water purification.
Identifiers: *Dechlorination, Sulfur dioxide, Oncorhynchus nerka.

Simultaneous continuous flow bioasssys of primary treated, chlorinated and dechlorinated municipal sewage were conducted with sockeye and pink salmon to evaluate the effectiveness of sulfur dioxide on removal of chlorine and chlorine induced toxicity. Chlorination decreased the average Mean Survival Time (MST) of sockeye in undiluted primary treated sewage from 293 minutes to 32 minutes. Dechlorination increased the average MST to 434 minutes indicating that all the chlorine induced toxicity and some primary sewage toxicity was removed. However, sewage which had received primary treatment remained acutely toxic to sockeye and pink salmon following chlorination-dechlorination. Dissolved oxygen and pH were not adversely affected by sulfur dioxide. The cost of dechlorination using sulfur dioxide is discussed. Lagooning is recommended as an alternative to chemical dechlorination where flows are small and land requirements not great. (Katz)

THE EFFECTS OF WATER-SOLUBLE PETROLEUM COMPONENTS ON THE GROWTH OF CHLORELLA VULGARIS BEIJERINCK,
Toronto Univ. (Ontario). Dept. of Botany.
P. B. Kauss, and T. C. Hutchinson.
Environmental Pollution, Vol. 9, p 157-174, 1975. 7 fig, 3 tab, 40 ref.

Descriptors: *Toxicity, *Chlorella, *Algae, Oil, *Oil pollution, *Bioassay, *Growth rates, Plant

growth, Evaporation, Primary productivity, Water pollution effects, Environmental effects, Food webs, Methodology, Organic compounds, Laboratory tests, Separation techniques, Analytical techniques, Thermodynamics.
Identifiers: Crude oil extracts, *Chlorella vulgaris, Sublethal effects, Benzene, Toluene, Xylene, Naphthalene.

Laboratory tests showed differences in toxicity of the aqueous extracts of seven different crude oils and one refined product to Chlorella. Reduction in cell numbers varied from 5% to 41%, during the first 48 hours. This toxicity was apparently a short-term lag phase. The observed toxicity of oil extracts is due to highly volatile compounds that were lost by evaporation within 24 hours. A significant stimulation of growth was observed with three of the oil extracts after their toxic compounds had evaporated. It is not known if this reflected an actual ability to utilize certain hydrocarbons heterotrophically from the extract. Other interpretations are discussed. (Katz)

METHOD FOR ASSESSMENT OF TOXICITY OR EFFICACY OF MIXTURES OF CHEMICALS,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking, and V. K. Dawson.
Investigations in Fish Control, No. 67, United States Department of the Interior, Fish and Wildlife Service, Washington, D.C., 1975. 8 p, 1 fig, 2 tab, 28 ref.

Descriptors: *Toxicity, *Pesticides, Assessments, Methodology, Analytical techniques, *Bioassay, Laboratory tests, *Zinc, *Toxicants, *Rotenone, *Rainbow trout, *Mathematical models, Sunfishes, Lethal limit, Mortality, Rhodamine, Copper, Antimycin a.
Identifiers: Synergistic effect, Additive index, Salmo gairdneri, Lepomis macrochirus, Cyanide, MS-222, Malachite green, Dibrom.

The individual toxic contributions of poisons were summed, and the additive toxicity was defined by a linear index for two chemicals in combination. This index expresses the toxicity quantitatively: zero indicates additive toxicity, negative values indicate less than additive toxicity, and positive values indicate greater than additive toxicity. Examples from the literature were selected and tests were conducted in the laboratory to assess the additive toxicity of selected chemical mixtures to fish. The values ranged from -1.37 for zinc and cyanide to 7.20 for malathion and Delnav (R). The method quantifies additive toxicity or efficacy, and assists in evaluating the advantages as well as environmental hazards resulting from chemical mixtures. (Katz)

DDT RESIDUES IN COD LIVERS FROM THE MARITIME PROVINCES OF CANADA,
Fisheries and Marine Service, Halifax (Nova Scotia). Inspection Branch.
G. G. Sims, C. E. Cosham, J. R. Campbell, and M. C. Murray.
Bulletin of Environmental Contamination and Toxicology, Vol. 14, No. 4, p 505-512, 1975. 1 fig, 4 tab, 16 ref.

Descriptors: *DDT, *DDE, *Pesticide residues, *Lipids, Commercial fish, *Path of pollutants, Pesticides, *Absorption, Analytical techniques, Chlorinated hydrocarbon pesticides, Methodology, Polychlorinated biphenyls, Pollutant identification, Canada.
Identifiers: Gadus morhua, *Cod, *Cod liver oil, Tissue analysis.

Residues of DDT and its analogs were estimated in cod liver samples (Gadus morhua) collected off the Maritime Provinces of Canada. The residue levels indicated widespread distribution of DDT over the entire region sampled. Variations in the relative contributions of DDE and DDT to the total DDT residues were noted and preferential accumulation of these residues in lipid rich tissues was noted. Residue levels found in cod livers were compared to residue levels determined in cod flesh taken from some of the same specimens and also to residue levels in commercially refined cod liver oils. Samples of each of these types were analyzed for DDT and PCB simultaneously. Commercial cod liver oil had only 10% (1.9 ppm) the amount of DDT found in cod liver. (Katz)

CONIFER DAMAGE AND DEATH ASSOCIATED WITH THE USE OF HIGHWAY DEICING SALT IN THE LAKE TAHOE BASIN OF CALIFORNIA AND NEVADA,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station, Berkeley, Calif.
R. F. Scharpf, and M. Srago.
In: Proceedings: Lake Tahoe Research Seminar II, 27 September 1974, Sands Vagabond Convention Center, South Lake Tahoe, California. Report No. NSF/RA/G-74-012, p 36-61. 2 fig, 5 tab, 11 ref.

Descriptors: *Salts, *Highways, *Highway icing, *Conifers, Salt tolerance, Coniferous trees, Pine trees, Vegetation effects, Vegetation, Water pollution, Water pollution sources, Pollutants, Soil contamination, Plant physiology, Plant pathology.
Identifiers: *Highway deicing, *Lake Tahoe(Nev - Calif).

In the winter of 1972-73 severe damage to conifers was observed along the major state and county highways in the Lake Tahoe Basin. Local foresters suspected highway deicing salt as the cause of damage. A biological evaluation was begun in the spring of 1973 to determine the cause and distribution of damage to the roadside conifers, the species affected, and the relationship of tree damage to the distances of trees from the highways. Estimates from the evaluation indicated that some 3000 trees died or were damaged on more than 300 locations in the basin. Browning of foliage, branch dieback, and in many cases, dead trees of all sizes and ages were observed. Damage and death were greater for trees near highways and less for trees at greater distances from the highways; in some cases damage occurred up to 60 feet from the pavement. Tests in the greenhouse, which involved adding different concentrations of salt solution to potted trees, duplicated symptoms and damage observed in the field. It was concluded that salt applied to the highways is a major cause of damage and death to roadside conifers in the basin. Damage probably will continue to occur if the use of sodium chloride for highway deicing continues at the present level. (See also W76-07793) (Sims - ISWS)

THE FISH FAUNA IN KANGAWA WATER SYSTEM, (IN JAPANESE),
Tokyo Univ. of Education, Nagano (Japan). Sugadaira Biological Lab.
H. Ando, and K. Aonuma.
Bull Sagadaira Biol Lab. 7, p 25-32, 1975.

Descriptors: Fish, Asia, *Fish populations.
Identifiers: Anguilla-Japonica, Carassius-Langsdorfii, Cobitis-Biwae, Cottus-Hilgendorfi, Cyprinus-Carpio, *Japan, Kangawa, Lefua-Echigonia, Liobagrus-Reini, Misgurnus-Anguillicaudatus, Moroco-Steindachneri-Steindachneri, Oncorhynchus-Keta, Oncorhynchus-Masou-Ishikawae, Plecoglossus-Altivelis, Pseudorasbora-Parva, Salvelinus-Fontinalis, Salvelinus-Leucomaenis-Pluvius, Tribolodon-Hakonensis-Hakonensis.

A total of 7 families and 17 spp. of fish were previously found in Kangawa Water System of Sanadamachi, Chisagata-kun, Nagano Prefecture, Japan. About 50 yr ago salmon disappeared from the water, and therefore presently 7 families and 16 spp. of fish live in Kangawa Water System. The 17 spp. are Oncorhynchus keta, Oncorhynchus mason f. ishikawae, Salmo gairdnerii f. iridens, Salvelinus leucomaenis pluvius, Salvelinus fontinalis, Plecoglossus altivelis, Pseudorasbora parva, Tribolodon hakonensis hakonenses, Syprinus carpio, Carassius langsdorfii, Misgurnus anguillicaudatus, Lefua echigonia, Cobitis biwae, Moroco steindachneri steindachneri, Liobagrus reini, Anguilla japonica, and Cottus hilgendorfi. Liobagrus reini are becoming rare recently, probably because of water pollution.--Copyright 1975, Biological Abstracts, Inc.

PRODUCTION OF SOME MASS CRUSTACEANS OF THE KUIBYSHEV RESERVOIR IN THE REGION OF SVIYAZH BAY, (IN RUSSIAN),
Kazan State Univ. (USSR). Dept. of Vertebrate Zoology.
R. K. Ziganshina, and E. M. Sofronova.
Biol Nauki 16(12), p 7-11, 1973.

Descriptors: *Crustaceans, Reservoirs, Bays, Daphinia, Production.
Identifiers: Acanthocyclops-Vernalis, Bosmina-Coregoni, Bosmina-Longirostris, Ceriodaphnia-Pulchella, Cyclops-Vicinus, Daphnia-Cucullata, Daphnia-Longispina, Diaphandsoma-Brachyurum, Eudiaptomus-Gracilis, Fecundity, Mesocyclops-Leuckarti, Moina-Rectirostris, Polyphemus-Pediculus, Russian-SFSR, Scapholeberis-Mucronata, Sida-Crystallina, Simocephalus-Vetulus, Span, Sviyazh, *USSR(Kuibyshev Reservoir).

On the basis of hydrobiological collections and experimental data the production of copepods and mass species of cladocerans of the Sviyazh Bay of the Kuibyzhev Reservoir on the Volga (Russian SFSR, USSR) was calculated. The production of copepods was considerably less than the productions of cladocernas and the production of the crustaceans on the whole was higher during a dry year (1969) than during a wet year (1970). The span of copepods was much greater than that of cladocerans and depended on the species and environmental factors. The fecundity of cladocerans depended mainly on the food supply; the fecundity of copepods depended on the environmental temperature. (Sida crystallina, Diaphanosoma brachuurum, Daphnia longispina, D. cucullata, Sinocephalus vetulus, Moina rectirostris, Ceriodaphnia pulchella, Scapholeberis mucronata, Bosmina longirostris, B. coregone, Polyphemus pediculus, Eudiaptomus gracilis, Cyclops vicinus, Acanthocyclops vernalis and Mesocyclops leuckarti are discussed.)--Copyright 1975, Biological Abstracts, Inc.

ECOLOGICAL OBSERVATIONS ON SIMULIIDAE OF THE ARRONE RIVER AND INFLUENTS OF THE BRACCIANO LAKE, (IN ITALIAN),
L. Rivosecchi, C. Cavallini, M. Nocciolo, and L. Rubeca.
Riv Parassitol 35(4), p 331-356, 1974.

Descriptors: Organic wastes, Water pollution, Thermal pollution, Europe, Lakes, Rivers, Ecology, Effluents.
Identifiers: Arrone, Boophthora-Erythrocephala, Bracciano, Cladophora, Eusimulium-Angustitarse, Eusimulium-Aureum, Eusimulium-Cryophilum, Eusimulium-Latigonium, Eusimulium-Latinum, Eusimulium-Latipes, Eusimulium-Latizonum-F-Paludicola, Eusimulium-Rubzovianum, *Italy, Nostoc, Obuchovia-Brevifilis, Odagmia-Dorieri, Odagmia-Nitidifrons, Odagmia-Ornata, Odagmia-Pontina, Odagmia-Variegata, *Simuliidae, Simulium-Galeratum, Thelohania, Wilhelmia-Lineata, Wilhelmia-Mediterranea.

Larvae and pupae were collected from 18 collecting stations in monthly collections. There were 16 spp. (Eusimulium cryophilum, E. angustitarse, E. latigonium, E. rubzovianum, E. latizonum F. paludicola, Odagmia ornata, O. nitidifrons, O. pontina, O. variegata, O. dorieri, Obuchovia brevifilis, Boophtora erythrocephala, Wilhelmia mediterranea, W. lineata, Simulium galeratum). In the area studied 4 zones were distinguised. Zones I and II have fairly pure waters. Zone III has strong organic pollution. Zone IV is a recovery zone. In zone I there are streams with fairly rapid waters; most of the larvae (about 70%) stick to debris, especially plastic materials. The most characteristic species of this zone is O. ornata (s.l.). The 3 spp. of this group (O. ornata, O. nitidifrons, O. pontina have 3 distinct filtering-apparatuses. Zone II has little brooks where ornytophilic species of the E. latipes and E. aureum groups develop; the E. latipes group prefers pure water, the E. aureum more polluted water. The Arrone River (Italy) has its source in zone III where there is strong auxotrophy; rocks are covered by Cladophora, Nostoc, etc. There are also high temperatures. The characteristic species is W. mediterranea. Zone IV has strong variations in level and in temperature. All the larvae cling to non-trailing plants. The most common species are W. lineata and S. galeratum. Parasitic organisms were also on Simuliidae larvae and adults (1% of the hosts for Microsporidia of the group Thelohania). For 10 spp. zonal and seasonal distributions are given. Some autoecological data on 14 spp. are summarized.--Copyright 1975, Biological Abstracts, Inc.

BRIEF MICROBIOLOGICAL CHARACTERIZATION OF THE KAYRAKKUM RESERVOIR, (IN RUSSIAN),
Akademiya Nauk Tadzhikskoi SSR, Dushanbe. Institut Zoologii i Parazitologii.
N. I. Bogdanov.
Izv Akad Nauk Tadzh Ssr Otd Biol Nauk. 3, p 34-36, 1973.

Descriptors: Bacteria, *Phytoplankton, Primary productivity, Reservoirs, Microorganisms, *Decomposing organic matter, *Photosynthesis, Biomass, Eutrophication, Oligotrophy.
Identifiers: Tadzhik-SSR, USSR.

The Kayrakkum Reservoir (USSR) was studied to determine the rate of photosynthesis of phytoplankton, its abundance and biomass; the rate of breakdown of organic matter and dynamics of the abundance of bacterioplankton; and abundance of microorganisms in the bottom deposits of the Reservoir depending on their chemical composition. The reservoir is oligotrophic with respect to the rate of photosynthesis of phytoplankton. The breakdown of organic matter exceeds primary production by a factor of 2-3, which indicates a high activity of bacterioplankton. A study of the chemical composition and microflora of the bottom deposits established the role of bacteria as a food source of the benthic invertebrates and revealed a direct relationship between the paucity of the benthos and the microflora of the bottom deposits of the Reservoir. The Kayrakkum Reservoir is located on the Syr-Darya River in the Tadzhik SSR and has an area of 513 km2, volume of 4.2 km3 and average depth of 8.1 m.--Copyright 1975, Biological Abstracts, Inc.

A CHARACTERISTIC OF THE LAKES OF THE LECZYNSKO-WLODAWSKIE LAKE DISTRICT BASED ON ABIOTIC ENVIRONMENTAL FACTORS, (IN POLISH),
Marie Curie-Sklodowska Univ., Lublin (Poland). Inst. of Biology.
S. Raswan, W. Podgorski, and C. Kowalczyk.
Ann Univ Mariae Curiesklodowska Sect C Biol 29; p 231-246, 1974.

Descriptors: *Lakes, Europe, Phosphates, Conductivity, Environmental effects, Lime, *Oxidation, Temperature, *Organic matter.
Identifiers: Abiotic conditions, Leczynsko, *Poland, Wlodawskie.

The dependence among some abiotic factors and an attempt to classify the lakes of the Leczynsko-Wlodawskie Lake district (Poland) are discussed on the basis of previously examined physico-chemical factors. There are correlations between the amount of lime and conductivity, phosphate and the organic matter content, temperature and oxidation, and pH and Mg, Fe and NH3. Electrolytic conductivity, conditioned by the lime of content and general oxidation, is the main factor defining the properties of the lakes. The remaining coefficients have an indirect or small effect on the differentiation of the lakes. On the basis of numerical values, 15 variants of lake classification were obtained.--Copyright 1975, Biological Abstracts, Inc.

HYDROBIOLOGICAL CONDITION IN THE RESERVOIR-COOLER OF THE LITHUANIAN STATE REGIONAL ELECTRIC POWER STATION, (IN RUSSIAN),
Akademiya Nauk Litovskoi SSR, Vilnius. Institut Zoologii i Parazitologii.
A. S. Astrauskas, and L. A. Rachyunas.
Gidrobiol Zh 11(1); p 19-27, 1975.

Descriptors: *Algae, Biomass, Reservoir, *Thermal pollution, Zooplankton, Spawning, Fish, Organic matter, Hydroelectric powerplants.
Identifiers: *Hydrobiological conditions, Lithuanian, SSR, USSR.

With heating a complex interaction system of hydrodynamic factors influencing the formation of washout zones and suspension accumulation was created in the reservoir (USSR). The group complex is under reconstruction. In the heated zone algae and higher water plants vegetate all year round. Zooplankton is less abundant because of evacuation of the organisms into the open part of the water body. After passing through the station cooler the number of organisms and their biomass are reduced by 1/2. The number and biomass of the benthic invertebrates are less with a comparatively greater species diversity (determined by exacuation of organic suspensions and detritus). Divergences in time and duration of spawning in different thermal zones are detected for certain fish species. The spawning for most species in the heated part starts earlier and takes less time.--Copyright 1975, Biological Abstracts, Inc.

PARTICULARS OF SOME SPECIMENS OF ALGAL FLORA OF THE PONDS OF BERRE AND VAINE (BOUCHES-DU-RHONE), (IN FRENCH),
Aix-Marseille-2 Univ. (France). Laboratoire de Biologie Vegetale.
R. Riouall.
Bull Soc Phycol Fr 19, p3-16, 1974.

Descriptors: *Algae, Lakes, Europe, Ponds, Aquatic habitats, *Salinity, Water pollution, Cytological studies, Organic wastes, Chemical wastes.
Identifiers: Berre, Bouches-du-Rhone, Callithamnion-Corymbosum, Ectocarpus-Confervoides-var-confervo, Enteromorpha-Prolifera-ssp-Prolifera, *France, Grateloupia-Filicina, Vaine.

Lakes Berre and Vaine (Bouches-du-Rhone) (France) constitute an aquatic habitat with very specific ecological conditions, especially with regards to salinity, turbidity and pollution. There has been a decrease in the average salinity since 1966 (30-13%), a progressive deposition of silt on the rocky substratum and an increase in the turbidity and pollution (organic and chemical). These changes in environmental conditions led to morphological and cytological changes in some of the algal flora, particularly Grateloupia filicina (Wulfen) O. Agardh, Callithamnion corymbosum (Smith) Lyngbye, Edtocarpus confervoides (Roth) Kjellman var. confervoides, Enteromorpha prolifera (O.F. Muller) J. Agardh ssp. prolifera type I de Bliding.--Copyright 1975, Biological Abstracts, Inc.

THE PRIMARY PRODUCTIVITY OF MARINE MACROPHYTES FROM A ROCKY INTERIDAL COMMUNITY,
California Univ., Irvine. Dept. of Population and Environmental Biology.
M. M. Littler, and S. N. Murray.
Mar Biol (Berl). 27(2), p 131-136, 1974.

Descriptors: *Biological communities, *Productivity, California, *Algae, Cyanophyta.

Identifiers: Colpomenia-Sinuosa, Corallina-Officinalis-Var-Chilensis, Egregia-Laevigata, Eisenia-Arborea, Gelidium-Pusillum, Gelidium-Robustum, Gigartina-Canaliculata, Halidrys-Dioica, Hydrolithon-Decipiens, Lithothrix-Aspergillum, Macrocystis-Pyrifera, *Macrophytes, Melobesia-Mediocris, Phyllospadiz-Torreyi, Pseudolithoderma-Nigra, Pterocladia-Capillacea, Rhodoglossum-Affine, Sargassum-Agardhianum, Thallus, Ulva-Californica.

This study represents the 1st report of primary production rates for Southern California intertidal producers. The production rates of 18 marine macrophytes near Wilson Cove, San Clemente Island, are close to those for other marine algal communities. (Macrophytes in order of declining productivity on a thallus-area basis: Gelidium pusillum, Ulva californica, Sargassum agardhianum, Gigartina canaliculata, Gelidium robustum, Egregia laevigata, Halidrys dioica, Phyllospadix torreyi, Lithothrix aspergillum, Phyllospadix torreyi (with Melobesia mediocris), Pterocladia capillacea, Macrocystis pyrifera, (blue-green algae), Colpomenia sinuosa, Rhodoglossum affine, Eisenia arborea, Corallina officinalis var. chilensis, Hydrolithon decipiens, Pseudolithoderma nigra). No apparent relationship was revealed between the productivity of an alga and the division to which it belongs; however, productivity was associated with growth form. Encrusting prostrate forms were the lowest producers in terms of g C/m2/h and g C/g dry weight/h; sheet-like and finely-branched forms showed a greater productivity than coarsely-branched forms. G. pusillum and U. californica had considerably greater production rates than the other algae measured.--Copyright 1975, Biological Abstracts, Inc.

SERUM CONSTITUENTS OF THE MALAYSIAN PRAWNS (MACROBRACHIUM ROSENBERGII) AND PINK SHRIMP (PENAEUS MARGINATUS),
Hawaii Inst. of Marine Biology, Honolulu.
G. H. Balazs, S. E. Olbrich, and M. E. Tumbleson.
Aquaculture. 3(2), p 147-157, 1974.

Descriptors: *Shrimp, *Pink shrimp, Cholesterol, Analysis.
Identifiers: Dehydrogenase, Glucose, Macrobrachium-Rosenbergii, Malaysia, Penaeus-Marginatus, *Prawns, *Serum.

Baseline serum values of newly captured M. rosenbergii and P. marginatus were determined by sequential multiple autoanalysis. Both species have considerable potential for commercial captive culture. Sex differences in serum constituent levels were found within species. Female pink shrimp had higher serum glucose levels than the males. Malaysian prawn males had higher cholesterol levels than females, and the latter had higher levels or activities of urea nitrogen, creatinine and lactic dehydrogenase. Pink shrimp held under laboratory conditions for 10 days had higher levels or activities of serum glucose and alkaline phosphatase and lower levels or activities of serum inorganic phosphorus, total protein, lactic dehydrogenase and glutamic-oxalo-acetic transaminase than pink shrimp sampled immediately after capture.--Copyright 1975, Biological Abstracts, Inc.

LOBSTER NUTRITION: EFFECT ON HOMARUS AMERICANUS OF DIETARY PROTEIN LEVELS,
Fisheries and Marine Service, Halifax (Nova Scotia). Halifax Lab.; Fisheries and Marine Service, Halifax (Nova Scotia). Dept. of Environment.
J. D. Castell, and S. D. Budson.
J Fish Board Can. 31(8), p 1363-1370, 1974.

Descriptors: *Lobsters, *Proteins, *Diets, *Biology, *Fish diets.
Identifiers: *Cornstarch.

Adult American lobsters (H. americanus) were fed artificial diets ranging between 0-60% protein and made isocaloric by adjusting the content of cornstarch. Those fed the highest level of protein were in the best condition; each decrease in protein resulted in a poorer condition of the lobsters. When lobsters were fed diets at the maintenance level of 0.5% of the body weight in food per day, decreasing the dietary protein content resulted in increasing weight loss and decreasing molt incidence, serum protein content, percent edible meat, heart weight, hepatopancreas and gonad weights and increased moisture content of several tissues. Although the serum glucose level was dependent upon the cornstarch content of the hepatopancreas was not affected by dietary starch levels. The glycogen content of the hepatopancreas showed a very large range of values when protein was omitted from the diet. A relationship between serum Ca level and molt cycle was demonstrated. Serum calcium values went from an average of 50 mg% after molting to over 70 mg% 1 mo. before molting.--Copyright 1975, Biological Abstracts, Inc.

PHYTOPLANKTON OF THE TAMPA BAY SYSTEM, FLORIDA,
Texas A and M Univ., College Station. Dept. of Oceanography.
J. T. Turner, and T. L. Hopkins.
Bull Mar Sci. 24(1), p 101-121, 1974.

Descriptors: *Florida, *Bays, *Phytoplankton, Plankton, Sampling, Analysis, Estuarine environments, Nutrients, Plant growth, Nitrogen, Phosphorus, Diatoms.
Identifiers: Ceratium-Hircus, Dinoflagellates, Gonyaulax-Balechii, Skeletonema-Costatum, *Tampa Bay(Fla), Phaed.

Phytoplankton, nutrients and physical factors in the Tampa Bay System were studied by collections taken quarterly from fall 1969, to early summer 1971. Forty-two diatom and 23 dinoflagellate taxa were recorded from sample aliquots. Annual averages of phytoplankton abundance (0.78 to 1.45 x 10 to the 6th cells/l) were intermediate in comparison with other estuaries of Florida and the northwestern Atlantic. Nitrate (2.31 microg-at/l), phosphate (29.16 microgramg/-at/l) and chlorophyll + pheopigments (16.43 mg/m3 were higher than averages for these regions. The principal diatom was Skeletonema costatum, as in other Gulf and east-coast estuaries. The most abundant dinoflagellates were Gonyaulax balechii and Ceratium hircus. Seasonal trends for nutrients varied from area to area in the bay complex and, on the basis of quarterly surveys, were difficult to interpret. Phytoplankton abundance in 1969-1970 was greatest in fall and least in spring in most sections of the bay. Patterns in 1970-1971 were more variable. Regionally, phytoplankton abundance and nutrient levels generally decreased with increasing salinity toward the mouth of the bay in all seasons. Low N : P ratios throughout the year suggest that N is more limiting than P in the Tampa Bay system.--Copyright 1975, Biological Abstracts, Inc.

THE GRADIENT OF SALINITY, ITS SEASONAL MOVEMENT, AND ECOLOGICAL IMPLICATIONS FOR THE LAKE IZABAL-RIO DULCE ECOSYSTEM, GUATEMALA,
Florida Univ., Gainesville. Dept. of Botany.
M. M. Brinson, L. G. Brinson, and A. E. Lugo.
Bull Mar Sci. 24(3), p 533-544, 1974.

Descriptors: *Lakes, *Salinity, *Seasonal, *Ecosystems, *Central America, Bays, Conductivity, Profiles, Water temperature, Primary productivity.
Identifiers: *Guatemala, Lake Izabal, Rhizophora-Mangle, Rio-Dulce, Amatique Bay.

Profiles of conductivity and temperature were measured along a transect of 42 km along the Rio Dulce from Lake Izabal to Amatique Bay, in the coastal lowlands of Guatemala, Central America. Readings were taken 3 times during the dry season between March 22-June 13, 1972. Water conductivity along the transect increased as the dry season progressed. Tides, winds, gravitation forces, a low topographic gradient and low discharge of fresh water at this time of the year are the factors responsible for the upstream movement of high conductivity water. The vertical and horizontal stratification of brackish water disappears with the onset of the wet season. Marine invasions into the lake, and the presence of mature red mangroves (Rhizophora mangle) along the Rio Dulce, are explained in terms of the seasonal appearance of this high conductivity water in the area. Pulses of primary production in the bays and coves surrounding the lake and the consequent availability of concentrated food sources coincident with the occurrence of seasonal oligohaline waters inside the lake, are discussed as the casual factors for marine invasions in tropical lakes.--Copyright 1975, Biological Abstracts, Inc.

Wien Tieraerztl Monatsschr. 61(6/7), p 169-178, 1974.

Descriptors: *Mercury, *Fish, Lakes, Pikes, Perches, Analysis, Pollutants, Effects, Water pollution effects, Pollutant identification.
Identifiers: *Austria(Carinthian Lakes), Muscle, Tissue.

Samples of fish (136) and 9 Carinthian lakes (Austria) were analyzed for total Hg in muscle-tissue. After radioactivation of the samples by thermic neutrons followed by chemical separation the amounts of Hg were estimated by gamma-spectroscopy. Calculations of concentrations were based on the fresh-weight of the tissue. Of 62 cyprinides, none showed values over 0.25 ppm Hg. Of 68 pikes and perches, 4 pikes contained more than 0.5 ppm Hg. Six trouts, taken from 1 lake, yielded an average concentration of 0.08 ppm Hg in muscle. The lakes in question are probably contaminated by airborne Hg. In 1 small lake focal contamination by an unknown source was assumed.--Copyright 1975, Biological Abstracts, Inc.

MERCURY IN SOME MARINE ORGANISMS FROM THE OSLOFJORD,
Oslo Univ. (Norway). Dept. of Marine Zoology.
A. T. Andersen, and B. B. Neelakantan.
Norw J Zool. 22(3), p 231-235, 1974.

Descriptors: *Mercury, *Mollusks, *Crustaceans, *Fish, *Fjords, Geographical regions, Water pollution effects, Aquatic life, Marine animals, Pollutants, Analysis.
Identifiers: Buccinum-Undatum, Carcinus-Maenas, Cardium-Edule, Clupea-Harengus, Cragon-Crangon, Cyprina-Icelandica, Gadus-Morrhua, Modiolus-Modiolus, Mya-Arenaria, Mytilus-Edulis, *Norway, Oslo, Pandalus-Borealis, Pasiphaea-Multidentata, Platichthys-Flesus, Sprattus-Sprattus.

The concentration of Hg was measured in 6 species of mollusks: Mytilus edulis, Cardium edule, Cyprina icelandica, Mya arenaria, Modiolus modiolus, Buccinum undatum; in 4 species of crustaceans: Carcinus maenus, Pandalus borealis, Crangon crangon, Pasiphaea multidentata; and 4 species of fish: Clupea harengus, Sprattus sprattus, Platichthys flesus, Gadus morrhua from the Oslofjord (Norway). The levels of Hg ranged from 0.29-0.84 microg/g dry weight (dw) for mollusks, 0.31-0.39 microg g/g dw for crustaceans, and 0.14-0.71 microg g/g dw for fish. M. edulis was used to study the geographical variation of Hg within the fjord. There was a higher concentration of Hg in the outer fjord. Analyses of various tissues in M. edulis revealed the highest Hg concentrations in the gills. The mean value of Hg in all the species studied was low compared with results from other areas.--Copyright 1975, Biological Abstracts, Inc.

PESTICIDE POLLUTION AND ITS ECOLOGICAL IMPLICATIONS, (IN FRENCH),
Paris-11 Univ., Orsay (France). Laboratoire de Zoologie.
F. Ramade.
Bull Soc Zool Fr. 99(1), p 19-25, 1974.

Descriptors: *Pesticides, Pollutants, Water pollution effects, Biomass, Ecology, Toxicity, Path of pollutants.

Pesticide pollution occurs on a worldwide scale. Pesticides are found not only in field areas directly exposed to application, but also in soil, air and water from remote areas. Like radioactive fallout, these compounds circulate between different regions of the biosphere and are concentrated in the biomass all along trophic chains. Biological effects must be considered at each organization level, not only at cellular, organic and individual ones but also at those of populations and communities. Because man stands at the top of the ecological pyramid he can be exposed to accumulated concentrations of toxic contaminants.--Copyright 1975, Biological Abstracts, Inc.

ALGAL FLORA OF UPPER ISTISU HOT SPRINGS, (IN RUSSIAN),
Leningrad State Univ. (USSR).
N. B. Balashova.
Vestn Leningr Univ Biol 1, p 35-39, 1975.

Descriptors: *Hot springs, *Cyanophyta, Algae, Aquatic plants, Saline water, Water temperature, Effluents, Diatoms, Reservoirs.
Identifiers: Azerbaijan-SSR, *Bacillaripphyta, *USSR(Upper Istisu).

In the hot springs of Upper Istisu (Azerbaijan SSR (USSR)) 16 spp. of Cyanophyta and 14 of Bacillariophyta were determined. The majority of blue-green algae developed in springs with temperatures of 25-47 C. Diatom species were found only in the effluent stream of 1 hot spring at 25C. All the blue-green algae and some diatoms have a characteristic feature-the development in thermal springs. Many of these species are frequently found in saline reservoirs.--Copyright 1975, Biological Abstracts, Inc.

STUDIES OF PARAGONIMUS OHIRAI MIYAZAKI: 1939 AND P. SADOENSIS MIYAZAKI ET AL. 1968 FOUND IN NOTO PENINSULA, ISHIKAWA PREFECTURE: JAPAN, (IN JAPANESE),
Kyushu Univ., Fukuoka (Japan). Lab. of Medical Zoology; and Kyushu Univ., Fukuoka (Japan). School of Health Science.
K. Kawashima, M. Miyahara, I. Tada, Y. Sakaguchi, and Y. Hashiguchi.
Jpn J Parasitol 24(1); p 24-33, 1975.

Descriptors: Crabs, Fish diseases, Shellfish, Snails, Molluscicides.
Identifiers: Angustassiminea-Parasitologica, *Japan(Noto Peninsula), Oncomelania-Minima, Paragonimus-Ohirai, Paragonimus-Sadoensis, Potamon-Dehaani, Sesarma-Dehaani.

In Noto Peninsula, Ishikawa Prefecture, Japan, 349 brackish water crabs (Sesarma dehaani) and 280 fresh water crabs (Potamon dehaani) were investigated for Paragonimus infection. The metacercariae found in S. dehaani were P. ohirai. Adults obtained from albino rats experimentally infected with the larvae were P. ohirai. Field and experimental studies on the snails showed that Angustassiminea parasitologica can serve as the snail host of this fluke. The metacercariae found in P. dehaani were similar to those of P. ohirai, but the former were more spherical in shape than the latter. Pinkish granules were hardly visible in the larvae found in P. dehaani, while in P. ohirai the larvae contained numerous pinkish granules. The metacercariae found in P. dehaani were P. sadoensis. Adults obtained from experimentally infected rats were P. sadoensis. Field and experimental studies showed that Oncomelania minima can be the snail host of this fluke. The 2 spp. Paragonimus show different host preferences in natural conditions, although their morphological features are similar. The interspecific relations between P. ohirai and P. sadoensis are briefly discussed.--Copyright 1975, Biological Abstracts, Inc.

PHENOLOGY AND PRODUCTIVITY OF PISTIA STRATIOTES L. ON THE VOLTA LAKE, GHANA,
Ghana Univ., Legon. Dept. of Botany.
J. B. Hall, and D. U. U. Okali.
J Appl Ecol. 11(2), p 709-725, 1974.

Descriptors: *Productivity, Africa, Lakes, Nutrients, Plant physiology, *Phenology, Plant growth, Seasonal, Viruses, Epidemiology.
Identifiers: *Ghana(Volta Lake), *Pistia-Stratiotes.

Floating enclosures were established in continuous P. stratiotes L. mats on the Pawmpawm arm which forms the southern-most tip of the man-made Volta Lake in Ghana. At 4-wk intervals from July 1971 to July 1972, Pistia samples were removed from the enclosures for subsequent assessment of biomass, density, plant size, community leaf area, flowering and leaf color. Growth rates, leaf area indices and productivity were calculated from these data. Concurrently water samples were taken for measurement of conductivity and pH. From Sept. to Dec. biomass and relative growth rate remained fairly constant, while flowering increased; from Dec. to Feb. biomass and growth rate fell drastically to about 300 g/m2 and -0.05 g/g/week respectively, and leaf yellowness was high; in March and April, the relative growth rate reached its maximum of 0.14 g/g/week, and the abundant vegetative reproduction of young rosettes resulted in high plant density and a low percentage of yellowed leaves; from May to Aug., biomass and relative growth rate declined slowly. Results are discussed in relation to earlier data on Volta Lake water composition, and possible seasonal variation in nutrient supply. Seasonal fluctuations in Pistia are possibly determined by variations in nutrient enrichment of the lake water by inwash from adjacent land, rather than by the incidence of epidemic virus disease as has been previously suggested. The estimated maximum productivity of Pistia on the Volta Lake, about 14.2 g/m2/day, is comparable with figures found for the plant elsewhere.--Copyright 1975, Biological Abstracts, Inc

NEKTON POPULATION DYNAMICS IN THE ALBEMARLE SOUND AND NEUSE RIVER ESTUARIES,
North Carolina Univ., Raleigh. Dept. of Zoology.
J. M. Hester, and B. J. Copeland.
Available from the National Technical Information Service, Springfield, Va 22161, as COM-75-10480, $6.00 in paper copy, $2.25 in microfiche. UNC-SG-75-02, January 1975. 131 p. 26 fig., 4 tab., 45 ref., 1 append. NOAA 03-3-158-40.

Descriptors: *Fish populations, *Animal groupings, *Distribution, *Estuaries, *North Carolina, Varieties, Saline water-freshwater interfaces, Shellfish, Biomass, Spawning, Fish migration, Juvenile growth stage, Fisheries.
Identifiers: *Species diversity, *Albemarle Sound(NC), *Neuse River(NC), Pamlico Sound(NC).

Albemarle Sound, North Carolina, an oligohaline estuary, is dominated by eight fish species. Three populations and two areas were identified. The indigenous population was associated with freshwater. Populations increase in winter due to emigration of the other populations. The migratory population emigrate to mesohaline waters in spring and remain until fall. Anadromous populations migrate through the estuary to tributaries. Young-of-the-year fish entered the sound in summer; most emigrated by late fall. Immigration coincided with increased estuarine peak primary productivity in spring and summer. All populations used the sound as a nursery. Juveniles fed on zooplankton and organic debris. Species diversity indices were low, indicating severe estuarine stress. The Neuse River estuary, a mesohaline system, was dominated by four fish species. The only important population was migratory producing pronounced seasonal fluctions. Spring immigration increased concomitantly with chlorophyll-a readings when it functioned as a nursery area. Low summer oxygen probably encouraged emigration to Pamlico Sound and prevented energy utilization. Few nektonic organisms remained to take advantage of the energy available. In these two estuaries, few species were dominant and varied seasonally; species diversity values were lower and did not fluctuate like other nearby systems. Twenty-three economically important fish species were found. The economic importance of these estuaries is stressed. (Buchanan-Davidson--Wisconsin).

AN EVALUATION OF THE POTENTIAL FOR ECOLOGICAL DAMAGE BY CHRONIC LOW-LEVEL ENVIRONMENTAL POLLUTION BY FLUORIDE,
California Inst. of Tech., Pasadena. Div. of Humanities and Social Sciences.
E. Groth.
Fluoride, Vol. 8, No. 4, p. 224-240, 1975. 2 tab., 74 ref.

Descriptors: *Fluorides, *Environmental effects, *Pollutants, Air pollution, Water pollution, Path of pollutants, Soil contamination, Wildlife, Vegetation, Food chains, Toxicity, Insects, Invertebrates, Mammals, Aquatic life, Birds, *Reviews.
Identifiers: *Biomagnification.

To assess the possible impact of fluoride pollution on natural ecosystems, research on the effects of fluorides on wildlife, plant and animal species is reviewed. Present knowledge is very incomplete, but fluoride meets most, if not all, of the criteria for a pollutant with a major potential ecological impact. Fluoride is a widespread pollutant; it is relatively persistent and is not biodegradable. It is absorbed by a great many organisms and is probably accumulating in food chains even at low levels of exposure. Fluoride possesses high biological activity, with toxic effects to many organisms. The levels of exposure which may occur in the environment appear to be capable of causing adverse effects on some of the wildlife species studied. Information on the potential effects on natural populations and ecological balances is not available. Fluoride may be transformed by some organisms into more toxic organic fluorides; such transformations would have a very serious ecological impact. There are no estimates of safe levels of fluoride for the environment. Research is needed to answer some of these questions and to obtain information for setting standards which will protect ecosystems from damage by fluoride pollution. (Buchanan-Davidson--Wisconsin).

A SURVEY OF ENVIRONMENTAL FEATURES IN A SECTION OF THE VELLAR-COLERON ESTUARINE SYSTEM, SOUTH INDIA,
Centre of Advanced Study in Marine Biology, Porto Novo (India).
K. Krishnamurthy, and V. Sundararaj.
Mar Biol (Berl). 23(3), p 229-237, 1973.

Descriptors: Estuaries, *Estuarine environment, Asia, *Mangroves, Chlorophyll, Phytoplankton, Zooplankton, Surveys, Productivity.
Identifiers: Acrocalanus, Asterionella, Centropages, Coleroon, Corycaeus, Coscinodiscus, Ditylum, Euterpina, *India, Lucifer, Oikopleura, Oithona, Vellar.

A survey was conducted on Nov. 15th, 1970 in mangrove forests and backwater regions of a section of the Vellar-Coleroon estuarine complex; a total of 19 stations were occupied. Detailed investigations on nutrients, pigments, and plankton were carried out. The following ranges in values were recorded: salinity, 10.40-30.50% parts per thousand; pH, 7.50-8.30; temperature 29.50 -30.50 C; total P, 0.72-3.34 microgram at /l; inorganic phosphate, 0.19-1.59 microgram at /l; ammonia, 0.34-0.36 microgram at /l; nitrite, 0.11-0.25 microgram at /l; nitrate, 2.85-6.94 microgram at /l; silicate, 18.49-134.92 microgram at /l; Dissolved O2 content ranges from 3.69-5.44 ml/l. Chlorophyll a ranged from an undetectable amount to 1.01 mg/m3, chlorophyll b and 0.02-0.85 mg/m3, chlorophyll c from 0-0.41 mg/m3 and carotenoids from 0-0.74 MSPU/m3 (Millispecific plant pigment unit)/m3. The plankton displacement volume ranged from a negligible amount to 3.60 cm3/m3; seston varied between 0.29-0.91 g/l. Phytoplankton was abundant at 3 stations; at other stations zooplankton was abundant. Coscinodiscus, Asterionella and Ditylum were the dominant forms among the phytoplankton; Oithona, Acrocalanus, Euterpina, Centropages, Corycaeus, Lucifer and Oikopleura were dominant among the zooplankton. Phytoplankton and zooplankton populations, as percentage of the total plankton, varied between 3.70 89.00% and between 11-96.30%, respectively. Average gross production values in the mangrove and back-water stations were 7.56 and 3.33 g C/m3/day, and the net production values 6.29 and 2.67 g C/m3/day, respectively.--Copyright 1975, Biological Abstracts, Inc.

LABORATORY EFFICACY OF 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) AS A LAMPRICIDE,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
V, K. Dawson, K. B. Cumming, and P. A. Gilderhus.
Investigations in Fish Control, No. 63, Department of the Interior, Fish and Wildlife Service, Washington, D.C. 1975. 13 p., 7 tab., 20 ref.

Descriptors: *Toxicity, *Pesticides, *Larval growth stage, Laboratory tests, *Embryonic growth stage, *Lampreys, Hydrogen ion concentration, Hardness(Water), Temperature, *Piscicides, Aquatic animals, Water properties, Lethal limit.
Identifiers: *Lampricides, *TFM, Sea Lamprey, American Brook Lamprey, Petromyzon marinus, Lampetra lamottei.

The lampricidal activity of 3-trifluoromethyl-4-nitrophenol (TFM) was tested under controlled laboratory conditions to evaluate factors which may influence the efficacy of the chemical. TFM was tested at temperatures between 7 and 22 C, total water hardness from 12 to 300 mg/l as CaCO3 and pH's of 6.5, 7.5, 8.5, and 9.0. TFM is more effective against larvae of the sea lamprey (Petromyzon marinus) than against embryos and prolarval stages. It is more effective against larvae of sea lampreys than against larvae of the American brook lamprey (Lampetra lamottei). Temperature does not influence the efficacy of TFM which decreases in hard water, especially at high pH's. Toxicity of TFM is affected more by pH than any other factor. TFM is significantly more effective against free swimming larvae than against those in burrows. (Katz)
W76-08063

EFFECTS OF 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) ON DEVELOPMENTAL STAGES OF THE SEA LAMPREY,
Bureau of Sport Fisheries and Wildlife, Millersburg, Mich. Hammond Bay Biological Station.
G. W. Piavis, and J. H. Howell.
Investigations in Fish Control, No. 64, Department of the Interior, Fish and Wildlife Service, Washington , D. C. 1975. 8 p., 3 ref., 1 fig., 1 tab.

Descriptors: *Piscicides, Pesticides, *Toxicity, *Lampreys, Laboratory tests, Immature growth stages, *Pesticide toxicity, Larvae, Mortality, Hatching, *Pathology, Fishkill.
Identifiers: *Sea Lamprey, *TFM, Hemoglobin, Petromyzon marinus.

Sea lampreys (Petromyzon marinus) at eighteen developmental stages from zygote through larva were exposed for 24 hours to a 10 mg/l (active ingredient) solution of TFM at 18 C. Embryonic development, incidence of abnormalities, and mortality in test animals were compared with unexposed controls. Exposed embryos in the first eight stages showed no immediate effects. However, the number of viable larvae produced was drastically reduced, incidence of abnormalities increased, hatching was delayed and hemoglobin production was inhibited or lacking. These findings suggest that treatment of streams with TFM at the customary rates probably does not effect a complete kill of sea lampreys in all developmental stages. (Katz)

ACCUMULATION AND LOSS OF RESIDUES OF 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) IN FISH MUSCLE TISSUE: LABORATORY STUDIES,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeaster Fish Control Lab.
J. B. Sills, and J. L. Allen.
Investigations in Fish Control, No. 65, Department of the Interior, Fish and Wildlife Service, Washington, D.C. 1975. 10 p., 5 tab., 4 ref.

Descriptors: *Pesticide residues, Pesticides, *Piscicides, Laboratory tests, *Bioassay, Water quality control, Hardness(Water), *Absorption, *Gas chromatography, Freshwater fish, Rainbow trout, Channel catfish, Brown trout, Lake trout, White bass, Analytical techniques, Chemical analysis, Hydrogen ion concentration, Carp, Bass, Trout, Sunfishes.
Identifiers: *TFM, *Tissue analysis(Fish), *Bioaccumulation, Morone chrysops.

Residues of 3-trifluoromethyl-4-nitrophenol (TFM) in muscle tissue of eight species of fish, after exposure under controlled conditions, were determined by gas chromatography. The mean concentration of TFM residue in samples from various species immediately after a 12 hour exposure to 1-4 mg/l of TFM ranged from 0.02 to 5.09 micrograms/gram depending on pH, temperature, hardness of test solutions, and TFM concentration. Residues decreased rapidly after the fish were removed from the test media, and were near the limit of detection (0.01 micrograms/gram) within 24 hours. (Katz)
W76-08065

RESIDUES OF 3-TRIFLUOROMETHYL-4-NITROPHENOL (TFM) IN A STREAM ECOSYSTEM AFTER TREATMENT FOR CONTROL OF SEA LAMPREYS,
Bureau of Sport Fisheries and Wildlife, :a Crosse, Wis. Fish Control Lab.
P. A. Gilderhus, J. B. Sills, and J. L. Allen.
Investigations in Fish Control, No. 66, Department of the Interior, Fish and Wildlife Service, Washington, D. C. 1975. 7 p., 3 tab., 10 ref.

Descriptors: *Pesticide residues, Aquatic plants, *Absorption, Pesticides, Sampling, *Piscicides, *Algae, *Path of pollutants, *Rainbow trout, Bot-

tom sampling, Water pollution sources, Invertebrates, Lampreys, Water quality control, Fish, Bottom sampling, Pest control, *Michigan.
Identifiers: *TFM, Tissue analysis, Bioaccumulation, *Lampricides, Au Gres River(Mich).

Samples of water, bottom soil, plants, invertebrates and fish were collected from two stations on the East Au Gres River in Michigan. Collections were made before, during, and after treatment of the stream with 3-trifluoromethyl-4-nitrophenol (TFM) for control of sea lampreys (Petromyzon marinus). Residues were highest in samples collected as the last portion of full-strength TFM flowed past each station, and were much higher in water and organisms than in the bottom soil. Fish retained higher residues than other organisms 24 hours after treatment (up to 6 micrograms/gram). Residues decreased to less than 0.08 micrograms/gram at 96 hours after treatment. Residues in soil were among the lowest found in all samples. (Katz)

A FIELD EVALUATION OF THE EFFECTS OF HEATED DISCHARGES ON FISH DISTRIBUTION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. R. Stauffer, Jr., K. L. Dickson, and J. Cairns, Jr.
Water Resources Bulletin, Vol. 10, No. 5, p 860-876, October 1974. 8 fig, 5 tab, 34 ref.

Descriptors: *Thermal pollution, *Heated water, Effects, Fish, Powerplants, Water temperature, Sampling, Evaluation, Water pollution effects.
Identifiers: Avoidance, Field study, *Fish distribution.

Studies were conducted to determine the distribution of fish in the New and East Rivers in relation to thermal discharges from Appalachian Power Company's fossil fuel plant at Glen Lyn, Virginia. Over 15,300 specimens representing 41 species were collected with seines, electrogear and rotenone at six sampling locations from February 1973 to October 1973. Sampling frequency was designed to evaluate the effects of ambient temperature upon preferred temperature. Diversity indices were calculated for each location. There was a slight decrease in the diversity indices for those stations located in the thermal discharge. Condition coefficients calculated for Notropis albeolus Jordan, Notropis rubellus Agassiz, Notropis spilopterus Cope, Ictalurus punctatus Rafinesque, and Etheostoma blennioides Rafinesque were found to be significantly ($p = .05$) lower in the thermal discharge for all species tested except E. blennioides. Temperatures were plotted against frequency of capture to determine a particular species temperature selection from field data and indicated that: (1) some species avoided high temperatures (i.e., Campostoma anomalum Rafinesque); (2) some species were attracted to high temperatures (i.e., Ictalurus punctatus; and (3) some species distribution was not affected by temperatures (i.e., Notropis spilopterus). (Bell-Cornell)

OCCURRENCE AND OUTFLOW OF ZOOPLANKTON IN THE KIEV RESERVOIR, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
Y. Y. Tseeb, and N. G. Revenko.
Gidrobiol Zh. 9(2), p 60-68, 1973.

Descriptors: *Zooplankton, *Reservoirs, Biomass, Seasonal, Bacteria, Phytoplankton, Crustaceans, Tributaries.
Identifiers: Dreissena, Kiev, Rotatoria, *USSR(Ukrainian-SSR).

The zooplankton biomass increase in the principal Dnieper tributaries (Upper Dnieper, Pripyat' and Teterev) and its outflow to the tail-water of the Kiev Reservoir (Ukrainian SSR, USSR) was studied in 1971. The main sources of zooplankton are the Upper Dnieper (3581 t(tons), or 87%) and the Pripyat' (474 t or 11.6% of the total biomass inflow). The incoming zooplankton was mainly Rotatoria (97% of total biomass). Zooplankton outflow from the reservoir (27,048 t) is 6.5 times larger than inflow, and shows seasonal changes in composition: Cladocera and Dreissena larvae predominate. The seasonal dynamics of gain and outflow in the reservoir are considered. In the total gain, the phytoplankton rate reaches 62%; bacterioplankton, 36%; and zooplankton, 2%. In the reservoir outflow the relative rates are quite different: bacterioplankton, 47%; phytoplankton, 36%; and zooplankton, 17%. This affects plankton formation in the lower reservoirs.--Copyright 1976, Biological Abstracts, Inc.

5D. Waste Treatment Processes

REMOVAL OF CESIUM FROM SAVANNAH RIVER PLANT WASTE SUPERNATE,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
J. R. Wiley, and R. M. Wallace.
Available from the National Technical Information Service, Springfield, Va 22161 as DP-1388, $3.50 in paper copy, $2.25 in microfiche. DP-1388, July 1975, 19 p, 8 fig, 3 tab, 7 ref. AT(07-2)-1.

Descriptors: *Water pollution, *Waste water treatment, Laboratory tests, On-site tests, *Cesium, Separation techniques, Chemistry, *Ion exchange.
Identifiers: Savannah River Plant(SC).

Synthetic and actual wastes were used in a process for separation and concentration of Cs137 from Savannah River Plant waste supernate by the two-column Duolite ion exchange process. In tracer-level studies, Duolite resin efficiently sorbed cesium from a solution with a composition expected for the plant process. The resin can be cycled repeatedly without damage. In column tests using actual waste supernates, greater than 99.99% of the Cs137 was removed. Cs137 from the Duolite columns was sorbed on zeolite for final solidification in concrete or glass. The overall volume reduction factor from cesium-salt solution to cesium-zeolite product is about 1400. Although direct sorption of cesium on zeolite is feasible, it would generate 40 times more cesium-zeolite than would be produced by the Duolite process. (Chilton-ORNL)

HIGH GRADIENT MAGNETIC SEPARATION, A TECHNOLOGICAL BREAKTHROUGH IN WATER PURIFICATION,
Fermon Tanning Co., Boston, Mass.
L. Riese.
The Leather Manufacturer, Vol. 91, No. 9, p 21-22, 28, September, 1974. 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Separation techniques, Tannery wastes, Magnetic studies, Water purification, Filtration.
Identifiers: *Magnetic filtration.

A description of the magnetic filtration techniques for separating water contaminants in tannery effluents is given. The important features of the magnetic filtration process include: the magnetic filter which consists of a filamentary matrix of finely divided ferromagnetic material such as steel wool in a vessel located in the center of a strong electromagnetic field; magnetic seeding by adding finely divided particles of a paramagnetic material and a flocculating electrolyte to form a fluffy coagulant around each contaminating particle; and, the removal of the solids which occurs when the slurry formed by the seeding passes through the magnetized filter and the fluffy mass is magnetically attracted to the steel wool. Backwashing is used to separate the fluffy mass from the steel wool into a separate container. A series of cylical devices are utilized in a continuous system of filtration and backwashing. The concentrated backwashed material can then be handled more efficiently by conventional methods such as filter pressing. Advantages of this system are a high speed of filtration and a relatively small area required as well as lower capital and operating costs per gallon. (Orr-FIRL)

DEWATERING OF SLUDGES GENERATED IN THE TREATMENT OF WASTE WATERS GENERATED IN REFINERIES (COMPORTAREA LA DESHIDRATARE A NAMOLURILOR PROVENITE DE LA TRATAREA APELOR REZIDUALE DIN RAFINARII),
R. Zamfirache, and E. Dacin.
Petrol si Gaze, Vol. 25, No. 6, p 328-332, 1974. 5 fig, 1 tab, 8 ref.

Descriptors: *Sludge treatment, *Dewatering, *Industrial wastes, *Filtration, Coagulation, Design criteria, Equipment, *Waste treatment.
Identifiers: *Refinery residual waters, Calcium oxide, Iron sulfate.

A description of the way sludges react to dewatering by filtration is provided by the means of two parameters, specific resistivity to filtration and the compressibility coefficient. Specific resistivity can be as high as 100 times 10 to the tenth power cm/gram. The dewatering characteristics of these sludges must be improved by treatment with coagulants. Conditioning with mineral coagulants, such as calcium oxide and iron sulfate, reduces the specific resistivity of the sludges down to 10-20 times 10 to the tenth power cm/gram, or 10% of the initial value. Using a mixture of calcium oxide and ferrous sulfate in premeasured quantities is more efficient than using calcium oxide alone. The specific resistivity to filtration and the compressibility coefficient are sufficient criteria for selecting specific equipment to be used for filtration dewatering of the sludges generated in the treatment of refinery residual waters. ECONOMY IN THE TREATMENT AND DISPOSAL OF PICKLING EFFLUENTS (EINSPARUNGEN BEI DER BEHANDLUNG UND BESEITIGUNG VON BEIZEREIAB-WASSERN),
G. Woltersdorf.
Metalloberflaeche, Angewandte, Elektrochemie, Vol. 28, No. 5, p 168-169, 1974. 2 ref.

Descriptors: *Metals, *Industrial wastes, *Waste water treatment, Economics, Aeration, Oxidation, Chemical precipitation, Lime, Sludge treatment, Waste disposal.
Identifiers: Pickling shop-generated wastes, Metal surface-treatment.

Possibilities for cost reductions in the treatment and disposal of pickling shop-generated waste waters in the metal surface-treatment industry are described. While small quantities of waste acids are neutralized with sodium hydroxide, this expensive chemical can be replaced by slaked lime when large amounts of waste acids are to be treated. Used iron mordants are aerated until all ferrous hydroxide is transformed into ferric hydroxide. To reduce the aeration tank volume and the aerator capacity, the dilute rinsing water is neutralized in a flow-through process, while the used mordants generated periodically are neutralized in a batch process. The bivalent iron present in the used mordant does not have to be oxidized quantitatively if the precipitation is conducted at high pH values, and the decanted liquid and the filtrate from the sludge separation unit are combined with the rinsing water. The residual amount of ferrous hydroxide is too small to require prolonged aeration, and the slaked lime is utilized completely for the neutralization of the rinsing water. To improve the sludge dewatering, the used mordants are diluted with dilute sludge from the neutralization unit. The sludge precipitated during the subsequent alkalization has high solid content, and is filtered more easily. (Takacs-FIRL)

TANNERY EFFLUENT,
Canada Packers Ltd., Toronto (Ontario).
J. G. Greifender.
Journal of the American Leather Chemists Association, Vol. 69, No. 10, p 452-459, October, 1974. 35 fig.

Descriptors: *Tannery wastes, *Waste water treatment, Separation techniques, Lagoons, Lime, Solids removal, Industrial wastes, Waste disposal.

Effluent processes used at the Beardmore Tannery, Ontario, are described. The first step involves segregation and grouping of the various effluent streams before treatment. The tannery segregates cooling water, salt water, beamhouse effluent, mixed effluent, and 'black water'. The cooling water needs no treatment and is diverted into a small creek. The salt water is screened over a vibrating separator and then pumped to a lagoon. The beamhouse effluent consists of the spent unhairing liquors and rinses. Waste water from the hair-saving limes is screened over a rotating perforated drum to remove long hair and then sent through a settling box to remove heavy suspended solids. Coarse solids are removed by a traveling belt screen and the screened effluent is pumped to a mixing tank. Flue gas treatment is used to remove most of the sulfides from the beamhouse effluent and also to reduce the pH from an average of 12.5 to 8.5. The mixed effluent contains the final effluent from the flue gas treatment in addition to the effluents from bating, pickling, chrome tanning, coloring, fatliquoring, and finishing. The mixed effluent is treated by primary settling in a mechanical clarifier. The primary sludge is pumped out to a drying facility and the clarified effluent is pumped to an aerated lagoon. The stabilized effluent from the lagoons is sprayed on grassland. The 'black water' stream contains the effluents from the vegetable tanyard scrubhouse, curry, and sole leather finishing. It is screened over a rotating perforated drum and pumped into the same lagoon holding the salt water. The water from this lagoon is disposed of over a field. (Orr-FIRL)

ENGINEERING METHODS OF PROCESS SOLUTIONS IN THE TREATMENT OF TANNERY EFFLUENTS,
National Research Inst. for Shoe and Allied Industries, Gottwaldov (Czechoslovakia).
J. Ludvik, K. Jansky, J. Boehm, and S. Siska.
The Journal of the American Leather Chemists Association, Vol. 69, No. 10, p 438-451, October, 1974. 6 fig, 1 tab, 14 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Tannery wastes, *Biological treatment, Sludge treatment, Mathematical studies, Filtration, Chemical engineering.

Bioengineering and chemical engineering methods used for the solution of some processes involved in tannery effluents purification were studied. Special attention was paid to biological treatment and sludge handling. The discussion of biological treatment contains an analysis of the fundamental processes occurring during the purification by activated sludge, such as substrate decomposition, mixed culture production, and oxygen consumption. Mathematical formulae involved in the individual processes and examples of graphical solutions for the particular case of tannery effluents are given. The sludge handling section provides a methodical analysis of the thickening and filtration processes. The importance of the relation between the sedimentation and thickening rate and the sludge concentration, and of the graphical estimation of the thickening tank loading is explained. An example is given of the primary and secondary sludge flow curves for the tannery effluent. Filtrability is discussed according to the Coackley and Eckenfelder methods, and an example of the technological results of vacuum and pressure filtration of the heat-treated sludge is presented. RECENT INVESTIGATIONS INTO THE DISPOSAL OF TANNERY WASTE WATER,
Instituut TNO voor Leder en Schoenen, Waalwijk (Netherlands).
P. J. Van Vlimmeren, and A. J. J. Van Meer.
The Leather Manufacturer, Vol. 91, No. 8, p 24-29, August, 1974. 7 fig, 11 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Tannery wastes, Chemical wastes, Chemical oxygen demand, Filtration, Sludge, Sulfides, Recycling, Waste disposal.
Identifiers: Unhairing operations, Chromium, Oxidation ditches.

Highlights of the work done on tannery waste water treatment and effluent quality by the Institute for Leather and Shoe Research, TNO, Waalwijk, Holland, and new developments in this area are presented. Reductions in the amount and degree of pollution of the effluent have been accomplished by the introduction of batch washing to replace continuous washing with a lattice door and the introduction of automatic drums and hide processors. Hair-saving unhairing methods are ideal means for the reduction of pollution from the beamhouse but need further refinement to become economically feasible. A new approach to the reduction of the pollution from the beamhouse involves conducting unhairing in the first soaking liquid. This method greatly lowers the COD of the effluent and produces a sludge with good dewatering and filtering properties. The catalytic oxidation of sulfides by aeration after the addition of manganous salt is a viable method for the treatment of sulfide containing effluents. The method for treating chromium containing wastes now under investigation by the Institute is the precipitation of chromium salts in residual chrome tanning baths followed by filtration and reuse after dissolving the precipitate with acids. The oxidation ditch system is also a solution for the problem of treating tannery waste water at reasonable costs. (Orr-FIRL)

CONTROL OF LIQUID EFFLUENTS FROM CHEMICAL/PETROCHEMICAL PLANTS,
Watson (J. D. and D. M.), London (England).
J. M. Sidwick, and D. W. Hayward.
Chemistry and Industry, No. 19, p 756-761, October, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Reviews, Chemical industry, Biological treatment, *Oil wastes.
Identifiers: Chemical treatment, Physical treatment.

The chemical and petrochemical industries use large volumes of water in their processes for washing down and cooling purposes. The large volume of contaminated waste water produced by these plants varies in pollutional impact; the waste streams may be acidic, alkaline, hot, toxic, may contain large volumes of oil or other suspended matter, or may exert a high biochemical or chemical oxygen demand. A categorization and general approaches to principal treatment problems of chemical and petro-chemical wastes are given. An important part of any waste treatment and disposal problem is to try to minimize waste loads at the source by process changes and/or process controls. The possibility of segregating waste streams and of discharging the non-toxic or relatively non-toxic wastes to the environment or to a municipal treatment plant should always be considered. Treatment methods discussed include: physical treatment such as free oil removal, solids separation, and heating, electro-flotation and dissolved air flotation; chemical treatment such as pH control, chemical flocculation, and chemical oxidation; and, biological treatment with suitably conditioned bacteria under aerobic and anaerobic conditions in biological filters, activated sludge systems, or stabilization ponds. Activated carbon treatment, ion exchange methods, dialysis, electrodialysis, electrophoresis, reverse osmosis, and ultrafiltration are also briefly mentioned. It is stressed that every particular problem must be considered individually. (Orr-FIRL)

FLAME TREATMENT OF WASTE WATERS CONTAINING ORGANIC CHLORINE AND SULFUR IMPURITIES,
A. P. Shurygin, and M. N. Bernadiner.
International Chemical Engineering, Vol. 14, No. 4, p 618-621, October, 1974. 2 tab, 4 ref. From: Khimicheskaya Promyshlennost, No. 9, p 27-28, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Chemical industry, Neutralization, Cyclones, *Sulfur compounds, Sodium compounds, Salts, *Chlorine.
Identifiers: *Flame treatment, Hydrogen chloride.

The flame treatment of waste waters containing organic chlorine and sulfur impurities is discussed. Sulfur dioxide and hydrogen chloride are the usual products of combustion of hydrogen chlorine and sulfur dioxide and are undesirable for sanitary and corrosive reasons. However, it is thermodynamically possible to add sodium hydroxide to the waste water and produce the non-toxic mineral salts, Na_2SO_4 and NaCl, from combustion. Experimental investigations were conducted in a laboratory cyclone apparatus to study the feasibility of neutralizing the toxic gaseous products and to determine the optimal parameters for the process. Almost complete combustion of the organic sulfur and chlorine compounds was obtained in the cyclone chamber under the following condi-

tions: temperature of effluent gases no higher than 990 C; excess air coefficient between 1.06 and 1.10; specific loadings of the cyclone chamber volume with treated waste water between 0.9 and 1.0 ton/cu m hr; and, spraying quality characterized by an average median drop diameter of 170-280 micrometers. This method for the neutralization of toxic gaseous materials in a high-temperature flame has been utilized in many facilities for the flame treatment of waste waters from chemical plants. (Orr-FIRL)

SECONDARY TREATMENT OF WASTE-WATER FROM SYNTHETIC RUBBER PRODUCTION,
Firestone Tire and Rubber Co., Akron, Ohio.
F. G. Troppe.
Rubber Chemistry and Technology, Vol. 47, No. 4, p 932-948, September, 1974. 13 fig, 4 tab, 14 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Neutralization, Coagulation, Flocculation, Biological treatment, Sludge, Costs, *Sewage treatment.
Identifiers: Synthetic rubber production.

A nine month study was conducted of the treatment of wastes resulting from synthetic rubber production at the Firestone Synthetic Rubber and Latex Company's Lake Charles, Louisiana, plant. The waste water was characterized by the presence of salt brine, dilute acid wastes, boiler blowdown, dilute latex, and coagulated rubber solids. Influent concentrations were BOD equal to 72 mg/liter, COD equal to 447 mg/liter, and suspended solids (SS) equal to 197 mg/liter. The treatment processes included neutralization, coagulation, flocculation, primary clarification, and sludge impoundment. Average reductions of 84.2% for BOD and 85.2% for SS were obtained. Conclusions reached as a result of the study included: a completely mixed aerated lagoon was effective in removing oxygen consuming pollutants; dissolved air flotation was the effective method for producing a high-quality effluent; chemical treatment could remove colloidal materials and produce an effective floc for initial and final dissolved air flotation clarification; final dissolved air flotation clarification was necessary to achieve a high-quality effluent and to prevent sludge auto-oxidation; the waste water was amenable to rapid biological oxidation; a retention time of approximately one day in the aerated lagoon produced the maximum BOD reductions; and the average sludge generation was 6.34 gallons/1000 gallons of waste water treated. The total project cost more than $2,000,000, of which about 25 percent was used to separate process waste water from storm water. The average costs for operation, maintenance and depreciation were $0.50 per 1000 gallons of treated waste water.(Orr-FIRL)

SECONDARY PLANT SHOEHORNED INTO SMALL SPACE,
Eastman Kodak Co., Rochester, N. Y. Utilities Div.; and Eastman Kodak Co., Rochester, N. Y. Waste Disposal Dept.
J. M. Lindsley.
Water and Wastes Engineering, Vol. 11, No. 10, p 18-21, October, 1974. 5 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Trickling filters, Aeration basins, Odor, Biochemical oxygen demand.
Identifiers: *Photographic industry wastes.

Eastman Kodak Company's utilities division at Kodak Park, Rochester, New York, is the company's primary photographic film, paper and chemical manufacturing complex. The waste water produced by the complex contains a wide variety of industrial wastes. The space available for a secondary treatment plant was only about 10% of the land area normally required. The constraints required that innovative engineering and unusual features be incorporated in the treatment plant design. The unusual features include: the use of both trickling filters and aeration basins to perform secondary treatment; common walls between aeration and clarification basins; distribution ports in those walls rather than the customary center-column distributors; and, the rotating sludge collectors and high rate of flow over the weirs. Storm flow will be handled by a two million gallon standpipe for storage of excess flow rate over 54 mgd. Some primary treatment will be provided in the standpipe. Odors associated with the plant's operation are controlled by burning the odor-causing gasses at 1100 F. Currently, advanced treatment technologies and methods to reduce the BOD load in-plant, at the source, are being investigated. (Orr-FIRL)

METHOD FOR TREATING SOLUTIONS CONTAINING CYANOHYDRINS,
Establissements Kuhlmann, Paris (France). Produits Chimiques.
P. Colin.
United States Patent 3,835,047. Issued September 10, 1974. Official Gazette of the United States Patent Office, Vol. 926, No. 2, p 609, September, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, *Patents, Toxicity, Chemical reactions, Biodegradation.
Identifiers: *Cyanohydrins, Hydrogen peroxide.

A patent has been issued for a method of treating aqueous solutions containing cyanohydrins. The resulting solution is made non-toxic by reacting the cyanohydrins with hydrogen peroxide to produce biodegradable oxamides. A similar method is also described for rendering solutions containing a metallic salt of hydrocyanic acid non-toxic. The cyanides contained in solution are reacted with carbonyl compounds and thereby converted to the corresponding cyanohydrin; the cyanohydrins are then reacted with hydrogen peroxide to form biodegradable oxamides. ACID DRAINAGE CONTROL AND WATER TREATMENT AT HEATH STEELE,
Heath Steele Mines Ltd., Newcastle, (New Brunswick).
E. Busse.
Canadian Mining and Metallurgical Bulletin, Vol. 67, No. 751, November, 1974. 5 fig, 5 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Acid mine water, Heavy metals, Toxicity, Salmon, Environmental effects, Mine drainage, Costs, Chemical precipitation, *Canada.
Identifiers: Salmon migration, Miramichi River(Canada).

Heath Steele Mines Limited, New Brunswick, Canada, produces lead, zinc, and copper flotation concentrates from complex massive sulfide ores. Acid drainage from the mines was contaminating the Northwest Miramichi River and harming the salmon migration in the stream. The acid drainage was caused by underground and surface water contacting metal sulfides, becoming acidic and acquiring dissolved heavy metals. Previous attempts to treat the mine water and to collect the contaminated surface drainage water were insufficient. To meet governmental requirements, a comprehensive water pollution abatement program was started early in 1970 and became fully operational by the fall of 1972. Areas with contaminated surface drainage were identified and isolated. The water from these areas is collected, together with the water from underground workings and pumped to the tailings disposal area. It is then mixed with the mill tailings and hydrated lime to precipitate the dissolved metals and to retain the metal hydrates and the tailings solids. Removal of 99.9% of the copper and zinc is achieved. The average metal toxicity in the Northwest Miramichi River has been reduced by 83 percent and peaks have been reduced by 92 percent. Control of drainage from the isolated contaminated areas is good; no escape of contaminated water from these areas to fresh water streams has been detected. The water quality of affected streams has improved substantially and the salmon migration has noticeably increased during the past two years. Capital cost of the project was $2.5 million. The current annual operating costs are $0.20 per ton of ore. (Orr-FIRL)

PRETREATMENT PROVIDES CONSTANT EFFLUENT QUALITY,
Syracuse Univ., Syracuse, N.Y. Dept. of Civil Engineering.
R. C. Faro, H. L. Kartiganer, A. Schneider, and D. Albano.
Water and Wastes Engineering, Vol. 11, No. 10, p 52-55, October, 1974. 2 fig, 6 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Pre-treatment(Water), Textiles, Municipal wastes, Lagoons, Biochemical oxygen demand.
Identifiers: Combined municipal-industrial wastes, Flow equalization.

The pretreated effluent from the Majestic Weaving company, Cornwall, New York, is purified in combination with municipal wastes at the Town of New Windsor's municipal treatment plant. An agreement between the town and the mill requires the mill to pretreat its waste water and equalize the flow before discharge to the municipal system, limits the mill to a daily discharge of 1.25 million gallons, and requires that the mill pay a proportional share of the costs of waste water treatment plant expansion, interceptor sewer construction, and plant operation and maintenance. Pretreatment at the mill consists of two completely-mixed, deep, aerated lagoons. The lagoon system is sized to produce an effluent BOD of less than 350 mg/liter under the most critical winter flow design conditions of 1.25 mgd. The first year of operation has demonstrated the following advantages of this system: it is reliable and relatively trouble-free; it achieves a constant and predictable effluent quality; equalization and treatment can be performed in the same unit process due to the long lagoon detention time; the equalization storage duration of 24 hours allows the municipal plant operator the flexibility of choice in industrial effluent receipt, thus maximizing removal efficiency and minimizing risk of system upset; solids handling or sludge removal facilities are not required at the pretreatment plant since these are released to the municipal facility; capital construction costs were less than those for comparable pretreatment processes; and operation reliability was obtained with expenses limited to power, labor and maintenance supplies. (Orr-FIRL)
W76-07513

WASTES MAY NOT BE A TREAT FOR PRETREATMENT.
Chemical Week, Vol. 115, No. 15, p 27, 30, October 9, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Pre-treatment(Water), Municipal wastes, Chemical wastes, Organic compounds, Biological treatment.
Identifiers: Combined municipal-industrial wastes, Chemical treatment.

Although combined treatment of municipal and industrial wastes is strongly advocated, the pretreatment necessary may make this an infeasible procedure for chemical wastes. The problems as-

sociated with combining municipal and organic chemical industrial wastes are discussed. For example, introduction of a readily degradable organic waste water into an activated sludge plant may require readjustment of organic loading. In another case, while the COD in domestic sewage is primarily suspended and colloidal and therefore insensitive to temperature, soluble industrial waste waters require a biological removal mechanism that is affected by temperature, resulting in a need for adjustment for low winter temperatures. Levels of necessary pretreatment are higher for discharge of industrial wastes to a physical-chemical treatment plant than to a biological treatment plant. Types of possible pretreatment to facilitate joint municipal-industrial plants include evaporation, addition of lime, freezing, or membrane processes, as well as a recommendation that organic chemical manufacturing processes be modified to reduce the quantity of waste water and treatment inhibitors produced. While some organic chemical waste streams can never be treated together with municipal wastes because of their high toxicity levels, more joint treatment may be possible if organic chemical plants implement adequate pretreatment plants. (Orr-FIRL)

JOINT BIOLOGICAL PURIFICATION OF DOMESTIC AND INDUSTRIAL WASTE WATERS (SOVMESTNAYA BIOLOGICHESKAYA OCHISTKA KHOZYAYSTVENNOBYTOVKH I PROIZVODSTVENNYKH STOCHNYKH VOD),
V. G. Mitereva, M. A. Luganskiy, I. K. Penke, M. A. Tomas, and I. S. Mal'kova.
Vodosnabzheniye i Sanitarnaya Tekhnika, No. 10, p 18-20, 1974. 2 tab, 6 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Biological treatment, Domestic wastes, Aeration, Biochemical oxygen demand, Sedimentation.
Identifiers: Combined municipal-industrial wastes.

A process for the joint biological purification of domestic and industrial effluents is described. Following preliminary sedimentation, the mixed waste water is aerated for 18 hours in a first stage, and for another 30 hours in a second stage aerator. The specific air consumption is 50 cu m/cu m in the first stage, and 40 cu m/cu m in the second stage. The air consumption in the regenerator amounts to 70 cu m/cu m. The quantity of the circulation sludge amounts to 70% in the first stage, and to 100% in the second stage of the aerator. This biological treatment results in a purified effluent with a BOD level not exceeding 20 mg/liter. (Takacs-FIRL)
W76-07515

AN INVESTIGATION INTO THE PRETREATMENT AND EFFECT OF AN INDUSTRIAL WASTE WATER DERIVED FROM THE MANUFACTURE OF AZO DYES UPON THE ACTIVATED-SLUDGE PROCESS,
Prudhoe Water Pollution Control Works (England).
A. Tong, and R. A. Young.
Water Pollution Control, Vol. 73, No. 5, p 584-588, November, 1974. 3 fig, 4 tab, 3 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Dyes, Chemical wastes, Activated sludge, Color, *Pre-treatment(Water), Chlorination, Chemical oxygen demand.
Identifiers: Azo dyes.

The Prudhow sewage works, Prudhow, United Kingdom, receives industrial effluent from a plant which manufactures azo dyes. This effluent has in the past given a red coloration to the sewage works' effluent and also to the river in which the effluent was discharged. Pretreatment of the industrial waste water by chlorination was instituted to reduce the intensity of the color of both the raw waste water and the effluent from the sewage works. An investigation has recently been conducted on the effect that the chlorinated azo dye waste water has upon the activated sludge process utilized at the Prudhow works. It was concluded that neither azo dyes nor chlorinated azo dyes have an appreciable effect on activated sludge. Chemical oxygen demand and optical density studies indicate that the effluent passes through an activated sludge plant relatively unchanged. Chlorination appears to be the only practical method for color and COD removal from azo dye wastes. However, more dangers may be present in chlorination than in leaving the color. At least 17 chlorinated organic groups were found in samples of the chlorinated waste water collected over one week. (Orr-FIRL)

A SOLUTION TO A PROBLEM OF FILTER CLOTH BLINDING,
Water Pollution Research Lab., Stevenage (England).
M. J. D. White, and R. C. Baskerville.
Effluent and Water Treatment Journal, Vol. 14, No. 9, p 503-505, September, 1974. 1 fig, 3 tab, 5 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Filtration, Grease, Sludge treatment, Lime.
Identifiers: Filter cloth blinding, Sludge conditioning, Ferric chloride.

The sewage works at St. Ives, Huntingdonshire, United Kingdom, was designed to treat 1500 cu m of sewage per day but now treats 2680 cu m per day of which about 20% is industrial. The BOD of the industrial waste is close to 2000 mg/liter and it seems to contain unusually high quantities of grease. A problem of filter blinding when dewatering the sludge (possibly caused by the high grease content) was so severe that filtering of the sludge was abandoned and the sludge was disposed of by tanker or dried on beds. A laboratory method for assessing filter cloth blinding together with an assessment of filtrability was used by the Water Research Centres' Stevenage Laboratory, Herts, to choose a conditioning system that was suitable for a sludge with such a high grease content. Results of the study indicated that ferric chloride and lime should be used instead of the previously recommended aluminum chlorohydrate. The use of ferric chloride and lime has enabled the treatment works to obtain a net yield of sludge cake of 12 kg/sq m hr at a cake solids content of 19%, which is greater than the design yield of the filter. The frequency of cloth washing has been reduced to once per 300 hours but is still more frequent than average values. (Orr-FIRL)
W76-07517

IMPROVED FORMAZAN TEST FOR THE DETERMINATION OF THE DEHYDROGENASE ACTIVITY OF ACTIVATED SLUDGE IN WASTE WATER TREATMENT PLANTS FOR THE JOINT BIOLOGICAL PURIFICATION OF URBAN AND TANNERY-GENERATED WASTE WATERS (VERFEINERTER FORMAZANTEST DER DEHYDROGENASENAKTIVITAET VON BELEBTSCHLAEMMEN IN ANLAGEN ZUR GEMEINSAMEN BIOLOGISCHEN REININGUNG VON GERBEREIABWAESSERN UND STAEDTISCHEN ABWAESSERN),
J. Gajdusek J. Kupec, and J. Svancer.
Wasserwirtschaft-Wassertechnik, Vol. 24, No. 6, p 193-194, 1974. 5 fig, 4 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Tannery wastes, Activated sludge, Municipal wastes, Analytical techniques, *Pollutant identification.
Identifiers: Dehydrogenase activity, Formazan test, Combined municipal-industrial wastes.

An improved formazan test has been developed for the determination of the dehydrogenase activity of activated sludge in waste water treatment plants. The plants purify combined urban and tannery-generated waste waters. The influence of temperature and pH value on the result of the formazan (TTC) test was studied. The TTC method is based on the enzymatic reduction of the colorless 2,3,5-triphenyl-tetrazolium chloride by reductases to red 2,3,5-triphenylformazan which is subsequently determined quantitatively by a colorimetric method. The rate of reduction of the reductase activity is proportional to that of the biological activity, or to the performance of the activated sludge. Incubation tests conducted at 20 C in a pH range of 6-11 revealed highest 2,3,5-triphenylformazan output at pH values between 9 and 10. Tests performed at pH 7 in a temperature range of 5-30 C revealed a nearly linear increase of 2,3,5-triphenylformazan output with temperature. (Takacs-FIRL)

STATUS AND PERSPECTIVES OF THE IMPROVEMENT OF BIOCHEMICAL WASTE WATER TREATMENT FACILITIES IN PETROLEUM REFINING PLANTS (SOSTOYANIYE I PERSPEKTIVY SOVERSHENSTVOVANIYA SOORUZHENIY BIOKHIMICHESKOY OCHISTKI STOCHNYKH VOD NPZ),
V. Ya. Gerber.
Khimya i Tekhnologiya Topliv i Masel, No. 9, p 10-14, 1974. 6 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, *Biological treatment, Aeration, Activated sludge, Reviews, *Treatment facilities, *Oil wastes.
Identifiers: Refinery wastes.

The state-of-the-art and perspectives in the development of biological waste water treatment in petroleum refining plants are presented. Ordinary effluents are treated in one-stage aeration tanks for 6 hrs at an air expenditure of 20-25 cu m per cu m of water and an activated sludge concentration of 2-3 g/liter. The phosphorus and nitrogen levels are adjusted to 3 and 15 mg/liter, respectively. The waste water thus treated is settled in a settler for 3 hrs. The emulsion-containing, saline waste water is first treated with de-emulsifiers. Non-ionogenic, biodegradable emulsifiers have been developed for this purpose. Possibly combined with municipal or chemical waste water, the de-emulsified waste water is then purified in aeration basins; this process can be substantially improved by the use of technical oxygen in place of oxygen in tight tanks, and of sectional, displacement type aeration tanks instead of stirrer type tanks. Final purification can be performed in lagoons. (Takacs-FIRL)

CONTROLLING PHENOLS IN REFINERY WASTE WATERS,
Robert S. Kerr Environmental Research Lab., Ada, Okla.
R. W. Short, Jr., B. L. DePrater, and L. H. Myers.
The Oil and Gas Journal, Vol. 72, No. 47, p 119-124, November 25, 1974. 7 fig, 2 tab.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, *Phenols, Biological treatment, Activated carbon, Analytical techniques, *Oil wastes.
Identifiers: Refinery wastes.

The control of phenols in petroleum refinery waste waters has been of concern for some time. A review is given of cooperative field studies by petroleum refiners, various regulatory agencies, and the American Petroleum Institute. The various studies identified the sources of phenolics in petroleum refining as the catalytic cracking process, the caustic treatment of cracked gasoline, and hydrocracking. Analytical reliability of

refinery waste water data, using EPA methodology, was improved by a seminar on analytical procedures. Both biological and activated carbon treatment systems demonstrated a high capacity for removal of phenolics. However, biological systems were found to be easily upset by changes in phenolics concentration. Activated carbon systems can provide excellent treatment if the pH of the waste streams is controlled; caustic conditions in the activated carbon columns must be prevented. (Orr-FIRL)

BASIC TRENDS IN THE IMPROVEMENT OF WATER SUPPLY, SEWER AND WASTE WATER TREATMENT SYSTEMS AT PETROLEUM PROCESSING PLANTS (OSNOVNYYE NAPRAVLENIYA V SOVERSHENSTVOVANII SISTEM VODOSNABZHENIYA, KANALIZATSII I OCHISTKI STOKOV NPZ),
A. S. Eygenson, and E. G. Ioakimis.
Khimiya i Tekhnologiya Topliv i Masel, No. 9, p 7-10, 1974. 8 ref.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, Recycling, Water reuse, Biological treatment, *Oil wastes, Sewers, Water supply.
Identifiers: Refinery wastes.

Basic trends in waste water treatment in the petroleum processing industry of the USSR are outlined. Efficient biological treatment plants, including oil traps, secondary settling tanks, sand filters, flotators, and one- or two-stage aerators are available at most of the petroleum processing plants. Recycling of the industrial water following biological purification is envisaged. The sulfurous, lye-containing effluents with high phenol and ammonia contents are the most polluted waste waters of petroleum processing plants. Such effluents should be treated by means of regenerable reagents in place of caustic soda, and technologies eliminating or minimizing such effluents should be developed. Methods for the recovery of sulfur and ammonia from such waste waters are being studied. The biological purification, usually conducted at a water flow rate of 0.3-0.5 m/sec, can be intensified by the use of technical-grade oxygen instead of air. (Takacs-FIRL)

ULTRAFILTRATION OFFERS 'GOOD' REMOVAL OF COLOR, COD, BOD,
Lakehead Univ., Thunder Bay (Ontario). Dept. of Chemical Engineering.
M. Fels, D. Smith, C. Miller, and P. Miller.
Canadian Pulp and Paper Industry, Vol. 27, No. 9, p 50-52, September, 1974. 4 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, Color, *Chemical oxygen demand, *Biochemical oxygen demand, Membrane processes, Costs.
Identifiers: *Ultrafiltration.

An investigation was conducted of the effects of ultrafiltration on bleached Kraft mill effluent with respect to COD, BOD5, and color reductions. The unit used in this study was a Amicon Ultrafiltration Cell, Model 4015. The liquid is forced through a Diaflo Ultra Membrane under pressure; solvents and low molecular weight components pass through the membrane and are the ultrafiltrate, the molecules of higher molecular weight are rejected by the membrane and remain in the cell as the concentrate. Ultrafiltration is considered to provide good removal of color, COD and BOD loadings. The cost of this process is relatively high. A 500 ton/day plant with an operating cost of $1.00/1000 gallons would require a capital investment of $20-$50 million. The results of the study indicate that maximum effectiveness is gained by using a membrane which has a molecular weight cutoff of 10,000. Since color, COD and BOD removal are not dependent on pressure, the process has the advantage of operating at low pressures as opposed to reverse osmosis which must operate at a very high pressure. The stirring rate was found to be an important parameter for practical applications. Design work on the hydrodynamic aspects of the equipment must be considered together with the membrane characteristics. (Orr-FIRL)

CHEMICAL RECOVERY PROCESS FOR SPENT COOKING LIQUORS,
Hiroshima Inst. of Tech., Itsukaichi (Japan).
M. Ono, and M. Yoneda.
Mitsubishi Heavy Industries Technical Review, Vol. 11, No. 1, p 61-67, February, 1974. 9 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Sulfite liquors, *Pulp wastes, Aeration, Separation techniques, Recycling.
Identifiers: Kraft pulping wastes, *Chemical recovery.

A new chemical recovery process for sulfite spent cooking liquor in the paper and pulp industry is summarized. Sodium carbonate is first separated by evaporating the smelt solution obtained by burning concentrated spent liquor in a recovery boiler. The sodium sulfite is produced in crystalline state by oxidizing the mother liquor of sodium sulfide with air in a sodium hydroxide solution which ranges from 15 to 25% by weight at a temperature over 100C. Thus, in the first step the process crystallizes and separates Na2CO3 from the water solution of smelt and in the next step aerates Na2S filtrate in NaOM solution to turn the Na2S into Na2SO3 crystal. Compared with conventional processes, this is simpler and is also capable of regenerating Na2SO3 of comparatively high purity. This method is applicable to a wide production ratio of pulps for the cross recovery of kraft spent liquor and sulfite spent liquor. (Murphy-FIRL)

STUDIES ON THE REMOVAL OF HEAVY METAL IONS FROM WASTE WATER BY FLOTATION METHOD WITH ANIONIC SURFACTANT I. - REMOVAL OF TRACES OF CADMIUM ION WITH SODIUM DODECYLBENZENE SULPHONATE, (IN JAPANESE),
M. Nakagawa, and Y. Kaida.
Reports of Government Industrial Research Institute (Kyushu), No. 9, p 10-18, 1973. 12 fig, 18 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Heavy metals, Surfactants, *Cadmium, *Floration, *Ions, Trace elements.
Identifiers: Sodium dodecylbenzene sulfonate.

The removal of heavy metal ions from waste water by a flotation method using an anionic surfactant was investigated. Specifically, traces of cadmium ions were removed with sodium dodecylbenzene sulfonate (DBS). The residual concentration of Cd in the flotation (15 to 30 minutes) of Cd nitrate solution (one ppm Cd) was 0.03 to 0.05 ppm at a pH of 4 to 11. The probable chemical species of Cd removed are divalent cations at pH 4 to 9 and precipitates of hydroxide at pH 5 to 11. With the addition of P04(3-), remarkable effects upon the removal were shown in the addition of Ca (50 ppm or more). This probably resulted in the formation of a certain Ca-Cd-hydroxyphosphate. After the effective height of the foam layer in the cell for the flotation was defined, the effect of repeating the flotation two times was examined. The residual concentration after repetition was 0.1 ppm or less in the case of one ppm initial Cd, and 50 ppm Ca, with the addition of P04(3-), being kept equivalent to the initial Cd, and 10 ppm DBS for each flotation. (Murphy-FIRL)

EXTRACTION OF VANADIUM AND CHROMIUM FROM EFFLUENTS.
Netherlands Patent NL 7313-348. Issued April 9, 1974. Derwent Netherlands Patents Report, Vol. V, No. 17, p M1, May 31, 1974.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, Metals, *Chromium, *Separation techniques.
Identifiers: *Vanadium.

A method was patented for the extraction of vanadium and chromium from effluents using aliphatic amines as the extraction agent. This is a two phase process whereby aqueous solutions containing dichromate and polyvanadate ions are treated. In the first phase, dichromate ions are selectively extracted at pH 1-3 with aliphatic amines. The chromium is recovered by extracting the organic phase with alkali hydroxide solution. In the second stage, the remaining polyvanadate ions are extracted from the aqueous solution at pH 3.5-5 using a similar extracting agent. The organic phase is again extracted with an alkali hydroxide solution. One suitable extracting agent is tri-n-octyl/tri-n-decylamine, mixed with a high boiling aromatic hydrocarbon. (Murphy-FIRL)

METHOD FOR INSOLUBILIZING WATER SOLUBLE CHROMATE IN CHROME WASTE RESIDUE,
Nippon Denko Co. Ltd., Tokyo (Japan). (Assignee).
S. Adachi.
United States Patent 3,803,032. Issued April 9, 1974. Official Gazette of the United States Patent Office, Vol. 921, No. 2, p 702-703, April, 1974. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, *Patents, Lignite, Pulp wastes, Activated carbon.
Identifiers: Chromate insolubilizing, *Chrome wastes.

A patent was granted for a method of insolubilizing water soluble chromate in chrome water residue. This water-leached residue occurs from roasted products which are obtained by the alkali oxidizing roasting of chrome ore. The chromate may be insolubilized and fixed into the residue by mixing the lumpy and/or powdery water-leached residue with organic materials. These organics are capable of being converted into activated carbon, by roasting the mixture in a gaseous atmosphere with a low oxygen concentration. A gas temperature of 400 to 1000 C and a material temperature of 400 to 700 C is used to quench the roasted product. The organic materials used include pulp waste liquor, lignite, sawdusts, pulp sludge, and chaffs. (Murphy-FIRL)
W76-07526

POLYMERS SOLVE WASTE WATER PROBLEMS,
Betz Labs. Inc., Trevose, Pa.
W. R. Cook, and L. V. Rankin.
Iron and Steel Engineer, Vol. 51, No. 5, p 43-46, May, 1974. 5 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Steel, Metals, *Polymers, *Polyelectrolytes, Flocculation, Coagulation.
Identifiers: Iron and steel industry.

The iron and steel industry uses millions of gallons of water and accumulates many tons of contaminants including metallic particles, dirt, oil, grease, carbon, and acid. The use of polymers (polyelectrolytes) has been applied to alleviate waste water problems. However, the uses and effects of such polyelectrolytes in flocculation and coagulation are still uncertain. Variables such as type of charge, density of charge, and molecular weight influence a particular polymer's effective-

ness. On-site testing proved to be the best method for choosing a polymer for a particular system. In the iron and steel industry, polymers are used for influent clarification, gas scrubber systems, hot mill systems, cold mill operations, and sludge handling. (Murphy-FIRL)

ABSORPTION CLEANING OF ORGANIC EFFLUENT VAPOURS,
Y. G. Sukharev, Z. A. Simanenko, and V. A. Stepanov.
Soviet Patent SU 391842. Issued December 13, 1973. Soviet Inventions Illustrated, Vol. V, No. 18, p J5, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Absorption, Chemical wastes, Air pollution, Organic compounds, *Patents, Odor.
Identifiers: Effluent vapors, Polyorganosiloxane liquids.

A patent was issued for the use of a lower polyorganosiloxane liquid as an absorbent in the cleaning of organic effluent vapors. Such solvent vapors as aromatic and aliphatic hydrocarbons were shown to be most effectively absorbed and regenerated by the use of polyethylsiloxane liquids, such as No. 3 (GOST 13004-67), as the absorbent. Absorption equipment may be conventional; the vapors are absorbed at 20 to 40 C. As an example, an air-vapor mixture containing 5 mg/liter turpentine was purified using polyethylsiloxane liquid No. 3, with an adsorption volume for turpentine of 19%. (Murphy-FIRL)
W76-07530

EFFLUENT TREATMENT IN THE LEAD CRYSTAL INDUSTRY,
J. B. Cappi.
Glass, Vol. 51, No. 4, p 143-145, April, 1974. 1 fig, 2 tab, 2 photo.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, *Lead, Suspended solids, Neutralization, Chemical precipitation, Coagulation, Fluorides, Sulfates.
Identifiers: Lead crystal manufacturing wastes, Lead oxide.

A control system for effluents produced from lead crystal manufacture was established by the Serck Eftrol company. These toxic discharges contain up to 35% lead oxide which originates from cutting, polishing and fume scrubbing. Contaminants which must be processed are suspended solids, fluorides, sulphates, and lead. The basis of the described treatment scheme was neutralization of the combined discharge which also serves to precipitate fluorides, sulphates, and lead, and to coagulate the colloidal suspended solids. One glass manufacturing plant in the Stourbridge area of Worcestershire was analyzed, with results of discharge limits for the effluent in terms of fluorides and sulphates. Operating data on the plant included flow rates, reagent consumptions, sludge production, and manpower requirements. (Murphy-FIRL)
W76-07531

ON THE APPLICABILITY OF THE BOD PARAMETER TO THE CHARACTERIZATION OF COKING PLANT-GENERATED EFFLUENTS (K VOPROSU O PRIYEMLEMOSTI POKAZATELVA BPK DLYA KHARAKTERISTIKI STOCHNYKH VOD KOKSOKHIMICHESKIKH ZAVODOV),
L. I. Khlopkova, G. I. Papkov, Ye. D. Schastlivenko, and V. A. Mgen.
Koks i Khimiya, No. 3, p 29-31, 1974. 3 tab, 12 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, *Biochemical oxygen demand, Biodegradation, Phenols, Temperature, Aeration.
Identifiers: Coking plant effluents, Rhodanides.

A study has been carried out to determine the relevancy of the BOD parameter for the characterization of coking plant-generated effluents. The BOD determination had poor reproducibility due to the high concentration of ammonia and ammonia salts in the phenol-containing waste waters. The BOD parameter was found unsuitable for the characterization of the degree of pollution of phenol-containing coking plant effluents and for the design of biochemical treatment plants due to the presence in them of various components, such as phenol and rhodanides with greatly differing rates of biochemical degradation. The rates of biodegradation of phenol and rhodanide, measured at 32 C, were found to be 100 mg/liter and 30-35 mg/liter, respectively. Both rates increased with increasing temperature. The volume and the operation of the aeration tanks for the biochemical treatment of coking plant-generated effluents should be determined with respect to the rhodanides as the least oxidizable pollutants. (Takacs-FIRL)
W76-07532

TREATMENT AND DISPOSAL OF WASTEWATER FROM ONION DEHYDRATION FACTORY AT SATPUR, NASIK,
Maharashtra Engineering Research Institute, Nasik (India).
G. B. Ambawane, N. Y. Dhekane, P. V. Patki, and B. R. Kapre.
Journal of the Institution of Engineers (India), Vol. 54, Part PH1, p 10-13, October, 1973. 1 fig, 3 tab, 4 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Food processing industry, Odor, Sedimentation, Coagulation, Aeration, Oxidation lagoons, Dehydration, Waste water disposal.
Identifiers: Extended aeration, *Onion dehydration wastes, Oxidation ditches.

An onion dehydration plant in India with a capacity of 30 to 33 tons per day produced about 272,400 liters of waste water per day, which, besides having substantially high loads of pollution, was also characterized by a pungent odor. Possible treatment methods tried included sedimentation, spray disposal, use of coagulents such as aluminum sulphate, ferric chloride, and ferrous sulphate (alone and in conjunction with lime), and extended aeration in an oxidation ditch. Of the methods tested, extended aeration in an oxidation ditch appeared to be the most practical. Advantages of this method included: simplicity and low initial investment in equipment; low production of sludge; low maintenance costs; BOD reduction of 95%; pungent odor removal; and excellent settling characteristics. (Murphy-FIRL)
W76-07533

ANALYSIS OF SOME PHYSICAL PROPERTIES OF POULTRY PROCESSING CHILLER EFFLUENT,
Richard B. Russell Agricultural Research Center. Athens, Ga.
W. K. Whitehead.
Poultry Science, Vol. 53, No. 2, p 571-574, March, 1974. 1 fig, 1 tab, 2 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Food processing industry, Costs, Water reuse, Biochemical oxygen demand, Dissolved solids, Suspended solids, Screening, Treatment facilities, Poultry, *Recycling.
Identifiers: *Poultry processing wastes.

Poultry processing plant chiller effluent is normally discharged to the sewer with no reuse of the water. By recycling the chiller water, a processing plant with capacity of 9600 birds per hour could save 10,000 dollars per year in water and refrigeration costs. Five such plants were sampled and physical properties of the waste water were measured to determine BOD, fat, and total and suspended solids content. Over 60% of the total solids in the waste water were dissolved solids, which could not be removed by screening and filtering. However, 51% of the suspended solids and 77% of the settleable solids could be removed by a 325 mesh sieve. (Murphy-FIRL)
W76-07534

TREATMENT OF DAIRY EFFLUENT WATERS TREATMENT.
French Patent FR 2187-704. Issued February 22, 1974. Derwent French Patents Abstracts, Vol. V, No. 11, p D6, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Food processing industry, *Patents, Dairy industry, Fermentation, Aerobic conditions, Bacteria, Suspended solids, Separation techniques.
Identifiers: *Dairy effluents.

A method of dairy waste water effluent purification is described. The effluent waters are purified by fermenting the material at 20-37 C with an aerobic and non-pathogenic bacteria strain containing l beta-galactosidase or a lactose oxidase, followed by separation of the bacterial material. Whey from cheese manufacture is generally fermented with a bacterial strain of the Enterobacter or Serratia species at 25-30 C and pH 6-7 for about 48 hours after which the medium is centrifuged to separate the bacterial solids. Ten percent of the culture is retained for the next batch and the remainder of the protein-rich bacterial mass can be used as animal feed. The treated effluent has a much lower content of solids and of reducing sugars such as lactose. (Murphy-FIRL)
W76-07535

CANDY WASTE TREATMENT,
W. D. Hatfield.
Industrial Wastes, Vol. 22, No. 2, p 20-22, 32, March/April, 1974. 2 fig, 2 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Food processing industry, Activated sludge, Lime, Costs, Capital costs, Biochemical oxygen demand, Hydrogen ion concentration, Nitrogen, Phosphorus, Nutrient requirements, Illinois.
Identifiers: *Candy manufacturing wastes, Carbohydrate wastes.

The Lucy Ellen Candies' plant in Sullivan, Illinois, was producing 12,000 gallons/day of industrial and domestic sewage with a BOD of 420 lbs. In order to achieve a 90% BOD reduction, or about 50 lbs/day, three alternative treatment methods were considered. These were: complete mix activated sludge with mechanical aeration, activated sludge diffused air in a pre-fabricated package unit, and trickling filter (surf plastic media) with recirculation. Of these, the first plan was selected. After initial start-up time and sludge build-up, effluent BOD was reduced to 50-150 mg/liter which was more than sufficient to meet the required standard of 500 mg/liter. It was necessary to add lime softener sludge from a local water works plant to weight down the activated sludge and to control pH at the desired value of 7-7.2. Ammonia nitrogen and phosphorus nutrients were also required because the carbohydrate waste from the candy operation lacked these essential chemicals. Costs of the system were given as $35,600 capital investment plus power costs for operation of $3.70/day. No operating or maintenance costs were provided. (Murphy-FIRL)
W76-07536

LIQUID WASTE TREATMENT FOR THE PETROLEUM REFINING INDUSTRY (SEIKIYU SEISEI NI OKERU HAISUI SHORI),
K. Fujimori, and F. Sato.
Nenryo oyobi Nensho, (Fuel and Combustion) Vol. 41, No. 7, p 635-640, July, 1974. 3 fig.

Descriptors: *Industrial wastes, *Waste water treatment, *Activated sludge, *Oil wastes, Separation techniques, Incineration, Sludge treatment, Sedimentation, Liquid wastes.
Identifiers: *Petroleum wastes.

The Mizushima Refinery of the Japan Mining Company installed an API oil separator and a coagulation settling tank (clarifier) at the time of its initial operation in 1961. More recently, an activated sludge treatment system together with a dehydration system and sludge incineration system was constructed, based on the new water quality standards and water protection laws. Waste water in a refinery is one of three types: rainwater, sea water for cooling, or oil containing liquid waste. The third is comprised of liquid wastes from the refining system, scrubber, pump seal water, tank drains, and rainwater containing oil, and requires special treatment. These liquid wastes contain emulsified oil, preservatives, chemicals of various kinds, sulfides, and impure substances in crude oil. The mixture of these is first treated in the API oil separator. After adjusting pH, the liquid is fed into the activated sludge treatment system. Part of the liquid is fed into the clarifier. Part of the treatment water is used in the aeration tank, settling tank spray water, and the incineration system dust collector. The emulsion from the API oil separator is sent to a centrifugal separator; oil is recovered and sludge is sent to the incinerator. (Seigle-FIRL)
W76-07537

EXPERIENCE WITH THE PURIFICATION OF WASTE WATER IN RESERVOIRS (OPYT OCHISTKI STOCHNYKH VOD V REZERVUARAKH),
V. M. Zikunov, and A. Sh. Akzigitov.
Neftepromyslovoye Delo, Vol. 1, p 38-40, March, 1974. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil wastes, Sedimentation, Equipment, Oxygen, *Dewatering, Separation techniques, *Settling basins.
Identifiers: *Petroleum wastes, Stratal water, Crude oil.

Experiences with the purification of stratal water and other effluents containing petroleum products, as generated during the dewatering and processing of crude oil, are presented. The stratal water separated from crude oil is admitted to vertical settling tanks without contacting oxygen. The stratal water is admitted to the petroleum layer floating on the surface by means of jet baffles. The floating petroleum layer is drained for recirculation in the dewatering process, and the purified water, after emulsion separation, is drained at the bottom and discharged in wells. Waste waters and relatively pure effluents containing oxygen decrease the efficiency of the settling tanks; they should be treated separately. (Takacs-FIRL)
W76-07538

SOLUTION TO THE WASTEWATER PROBLEM IN THE SHEET-METAL PROCESSING INDUSTRY (LOESUNG VON ABWASSERPROBLEMEN DER BLECHVERARBEITER),
K. Marquardt.
Baender Bleche Rohre, Vol. 15, No. 4, p 161-164, 1974.

Descriptors: *Ion exchange, *Reverse osmosis, *Metals, *Waste water treatment, *Industrial wastes, Water reuse, Recycling, Effluents.
Identifiers: *Ultrafiltration, Electroplating, Sheet-metal processing.

The function and uses of ion exchangers, reverse osmosis, and ultrafiltration in the purification of waste waters generated in the sheet-metal processing industry in general, and in electroplating shops in particular, are described. Ion exchangers with regeneration in counterflow permit considerable reduction in reagent and water expenditure. Strong basic anion exchangers should have a pre-stage in the form of a weak basic anion exchanger for the removal of organic compounds and heavy metal-cyanide complexes from the strong basic ion exchange resin in counterflow. It isj possible to automate ion exchangers for continuous or semi-continuous operation and reduced reagent consumption. Reverse osmosis, possibly combined with ultrafiltration and the ion exchange process, is suitable for: the recovery of precious metals and reagents; the preparation of drinking water and high-purity water; and the detoxification of toxic effluents such as those generated in the electroplating industry. (Takacs-FIRL)

CHROMIUM REMOVAL FROM WASTEWATER BY ELECTROCOAGULATION (ELEKTROKOAGULYATSIONNAYA OCHISTKA STOCHNYKH VOD OT KHROMA),
G. A. Selitskiy, and N. P. Antropov.
Tsvetnyye Metally, No. 4, p 85-86, 1974. 1 fig, 1 tab.

Descriptors: *Chromium, *Waste water treatment, *Electrolysis, Industrial wastes, Anodes, Cathodes, Coagulation.
Identifiers: Electroplating, *Electrocoagulation, Steel electrodes.

A simple, highly effective method removes hexavalent chromium from industrial waste waters as generated in electroplating processes by electrocoagulation. The waste water containing chromates is subjected to electrolysis between steel electrodes, whereby bivalent iron and hydrogen are released by the anode and cathode, respectively. The bivalent and trivalent iron ions and the trivalent chromium ions reduced from hexavalent chromium form hydroxides that can be quantitatively separated. Electrolysis is conducted with direct current, using a current density of 0.8-1.2 A/sq dm for chromate concentrations up to 120 mg/liter. Electrolysis takes 15 to 20 minutes. It was found possible to quantitatively remove chromium from waste waters by this electrocoagulation process. (Takacs-FIRL)
W76-07540

THE OPERATION OF THE FLOTATING HYDROCYCLONE IN THE CLARIFICATION OF ROLLING MILL-GENERATED WASTEWATERS (RABOTA GIDROTSIKLONA-FLOTATORA DLYA OSVETLENIYA STOCHNYKH VOD PROKATNYKH TSEKHOV),
L. D. Subbotkin.
Tsvetnyye Metally, No. 4, p 86-87, 1974. 1 fig.

Descriptors: *Waste water treatment, *Copper, *Zinc, *Suspended solids, *Oil wastes, *Industrial wastes, Metals.
Identifiers: Rolling mill wastes.

The use of flotating hydrocyclones for the clarification of rolling mill-generated waste waters containing 0.4-0.5 mg copper, 0.6-0.7 mg zinc 10-50 mg suspended matter, and 50-200 mg petroleum products per liter is discussed. The pressure under which the waste water is to be saturated with air (calculated as a function of the water and air expenditures, air density, the solubility of nitrogen in water, the duration of the saturation, and the rate constant of the solution of air in water) was found to be 3.5 atm. Experiments with flotating hydrocyclones of one to two m in diameter under practical conditions revealed efficiencies of 50-60% for suspended matter, and 60-70% for petroleum products. The residual suspended matter and petroleum product contents in the clarified water were in the respective ranges of 10-25 mg/liter and 30-50 mg/liter. (Takacs-FIRL)
W76-07541

WASTE WATER TREATMENT BY MEANS OF ION EXCHANGE RESINS (TRATTAMENTO DI ACQUE DI SCARICO CON RESINE A SCAMBIO INOICO),
La Nouva Chimica, No. 3, p 71-75, March, 1974.

Descriptors: *Ion exchange, *Waste water treatment, *Recycling, Water reuse, Industrial wastes, Metals, Copper, Nickel, Zinc, Cadmium, Sodium, Cyanides, Activated Carbon, Resins.
Identifiers: *Electroplating, Ion exchange resins, Cationic ion exchange resins.

The technological and economic advantages of the use of ion exchange resins for waste water treatment, especially in the electroplating and surface-treatment industries, are described. The water treated by ion exchange resins is of constant quality regardless of fluctuations in ion concentration. Ion exchange resins are also suitable for the recycling of process water after the removal of ions, and for the recovery of precious metals from liquids. Lewatit ion exchange resins are used for the removal of chromates, cyanides, and other toxic substances including nonionogenic substances, from process waters. The waste water to be treated by ion exchange resins should be purified by filters or activated carbon. Cationic ion exchange resins are regenerated by means of hydrochloric or sulfuric acid, and caustic soda is used for the regeneration of anionic resins. It is possible to economically remove copper, nickel, zinc, cadmium, sodium, chromic acid, cyanides, phosphoric acid, and nitric acid from process waters provided their individual concentrations are below 500 mg/liter. (Takacs-FIRL)
W76-07542

APPLICATION OF SIMILITUDE AND MODELING IN WASTE WATER TECHNOLOGY (ANWENDUNG DER AEHNLICHKEIT UND MODELLIERUNG IN DER ABWASSERTECHNOLOGIE),
I. Horvath.
Gas and Wasserfach, Wasser/Abwasser, Vol. 115, No. 3, p 128-136, March, 1974. 8 fig, 30 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Model studies, Kinetics, Equipment, Chemical industry, Operation, Design.

Problems and possibilities of the application of the similarity theory in modeling waste water treatment facilities with respect to scale-up are discussed. In the study of waste water treatment, technology and equipment, geometric, kinetic, and dynamic resemblances, as well as similarities in material transfer, reaction kinetic, and biological processes are of primary interest. While it is impossible to achieve absolute similarity, satisfactory results can be obtained by approximate modeling. Results achieved in the areas of zymology, chemical industry, and hydrology will be valuable in the study of modeling and scale-up with respect to waste water treatment plants. (Takacs-FIRL)

POSSIBILITIES OF AUTOMATING THE OPERATION OF CLARIFYING THICKENERS IN PROCESSING PLANTS BY USING OR-

GANIC-SYNTHETIC FLOCCULANTS (MOYENS D'AUTOMATISER PAR L'EMPLOI DE FLOCULANTS ORGANIQUES SYNTHETIQUES LE FONCTIONNEMENT DES EPASSISSEURS CLARIFICATEURS UTILISES DANS LES INSTALLATIONS DE PREPARATION),
J. Reuter.
Aufbereitungs-technik, Vol. 15, No. 4, p 187-193, 1974. 8 fig, 7 ref.

Descriptors: *Sludge treatment, *Waste water treatment, Flocculation, Pulp and paper industry, *Pulp wastes, *Industrial wastes, Polymers, Flow rate, *Automation.
Identifiers: *Sludge thickening, Polyacrylamide.

The operation of a clarifying thickener, used in technological processes for continuous solid-liquid separation of pulps, can be automated by using synthetic flocculants, such as polyacrylamide, as long as the requirement is maintained for keeping the overflow water always free of settleable matter. The organic flocculant is added immediately before admission of the pulp to the thickener at a rate not higher than 0.1 percent. The volume and the solids content of the pulp feed are measured (the volume by a magnetic-inductive method and the solids content by radiometry) continuously, and the product of the two measured values will give the quantity of the solid matter being fed to the thickener. The flocculant metering is regulated automatically as a function of the solids volume. For maintaining a uniform degree of sludge thickening, the level in the thickener is monitored permanently by means of dip pipes or a depth-finder, or radiometrically by isotope barriers. The sludge quantity to be withdrawn is regulated as a function of the flow rate of the sludge pump in such a way that the level in the thickener remains almost identical. (Takacs-FIRL)
W76-07545

PLASMA TREATMENT OF TEXTILES: A NOVEL APPROACH TO THE ENVIRONMENTAL PROBLEMS OF DESIZING.
Textile Chemist and Colorist, Vol. 5, No. 11, p 27-36, November, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Pollution abatement, Oxidation, Degradation(Decomposition).
Identifiers: Desizing, *Plasma treatment, Polyvinyl alcohol, Oxidative degradation, Fiber degradation.

The textile sizes applied to warp yarns to facilitate weaving which must be removed from the fabric before finishing greatly contribute to the pollution problems of the textile finishing industry. One of the most widely used of the synthetic sizing agents, polyvinyl alcohol (PVA), is not easily biodegraded. For this reason, a study of the use of low temperature plasma, an electrically excited form of gases at low pressure, for the removal of PVA size from fabrics was performed. Results indicate that PVA is oxidatively degraded by both oxygen and air plasmas. A significant portion of the PVA is oxidized directly to carbon dioxide and water during plasma exposure, which will reduce problems associated with the desizing operation. Fiber degradation due to this treatment is minimal and no adverse effects on fabric properties were observed. (Sandoski-FIRL)

CLOSED SYSTEM AND THE MODERN TECHNOLOGY (KUROZUDO SHISUTEMU TO GENDAI GIJUTSU),
Agency of Industrial Science and Technology, Tokyo (Japan).
T. Sakai.
Gijutsu to Kogai, (Technology and Pollution), Vol. 4, No. 1, p 14-17, January, 1975. 2 fig, 2 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, *Recycling, Chemical wastes, Coagulation, Oil industry, Liquid wastes.
Identifiers: Zero discharge, Closed systems, Tin, Antimony.

A closed system for liquid waste treatment is being used in an electric appliance factory for its welding-plating process which uses antimony and tin. In the system, alkali is added to the plating liquid waste. Metals are coagulated and settled by sodium hydroxide. The supernatant liquid is recirculated back to the scrubber. The settled sludge is dehydrated and dissolved by hydrochloric acid. Water from the dehydration process is sent back to the supernatant liquid tank. Dissolved metals are made into salt, heated, and metal fumes are produced for the welding process. Exhaust is scrubbed, and the clean air is released while the liquid goes to the scrubber. This process recovers about half of the metal originally used in the plating process. Another example of a closed system is found at a chlorinated organic compound manufacturing plant, where liquid waste contains 4% salt and 0.15% toxic organic compounds in the amount of 1500 cu m/day. The treatment of this liquid was considered impossible until a closed system was developed. The liquid waste created by chlorination and caustization of petroleum compounds is heated and evaporated. Condensate is returned to the plant and used in the caustization process. The liquid waste is then centrifugally separated, heated, and evaporated. The distillate is sent to a process which produces glycerine. The separate solid becomes impure salt, which is heated and refined. The heat is recovered and used to form chlorine-caustic soda fume. Heated and refined salt is electrolyzed and chlorinated caustic soda fume is produced, which is used for chlorination and caustization of petroleum components. (Seigle-FIRL)

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, Ion exchange, Separation techniques, Water reuse, Recycling, Liquid wastes.
Identifiers: Chemical treatment, Surface finishing wastes, Zero discharge, Closed systems.

Surface coating processes include acid and alkaline deoiling treatment, cleansing, and neutralization; plating by zinc, tin, lead, nickel, chromium, copper, silver, and gold, singly or in combination; and, chromating. A treatment system developed for use with liquid wastes generated from these processes has been designed so that no effluents will be created, and all liquids will be circulated within a closed system. A flow chart describes the process as follows: all liquid wastes enter the scrub water tank and are then sent to the ion exchange resin treatment where liquids are classified into groups and treated separately; deionized liquid circulates back to the scrub water tank; recovered waste, newly created waste from the surface coating process, and other miscellaneous liquid waste are sent together to the chemical treatment system where liquids and solids are separated; and the separated liquid is concentrated and evaporated. Condensed water is circulated back to the scrub water tank and the solid mixes with the solid sludge from the separation process. Metals in the sludge are recovered by contracted metal refiners and reused. Problems in the system are material corrosion, noise, and its appearance. (Seigle-FIRL)

LIQUID WASTE TREATMENT FOR HEAVY METALS (JUKINZOKU NO HAISUI SHORI NI TSUITE),
E. Tatsuta.
Nenryo oyobi Nensho, (Fuel and Combustion), Vol. 41, No. 1, p 39-44, January, 1974. 2 fig, 2 tab.

Descriptors: *Waste water treatment, *Industrial wastes, Metals, Equipment, *Heavy metals, Chemical precipitation, Chemical reactions, Liquid wastes.
Identifiers: Mitsubishi Gockel treatment system, Dyer clarifier.

After a general discussion of the principles of various treatment methods for metals containing effluents, the dyer clarifier and the Mitsubishi Gockel system are described. The dyer clarifier is a vertical structure with a rapid jet stream stirrer at the bottom, a reversed funnel shaped flocculation chamber, a funnel shaped blanket zone, a demister, and a clear water tank at the top. The sludge overflows the funnels of the blanket zone and the flocculation chamber into a sludge condensation chamber, and is discharged. The Mitsubishi Gockel system is a compact, movable system for the chemical treatment of complex industrial waste water containing various types of heavy metals in which condensation, precipitation (settling), and filtering are involved. Many unique chemical reagents are added in the process according to the type of waste liquid. The system, used basically for batch treatments of a small quantity of a highly concentrated, complex chemical waste, is a compact, high performance system that can be installed in a small space. By changing the reagent combinations, various types of liquid waste can be treated. (Seigle-FIRL)

MERCURY RECOVERY,
Belgian Patent 780222. Issued September 4, 1972. Derwent Belgian Patents Abstracts, Vol. U, No. 45, p D1, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Mercury, *Patents, Flash distillation.

A patent has been granted for a method of mercury recovery from aqueous solutions by treating the effluents with a reducing agent and steam distilling finely divided or colloidal mercury. Finely divided or colloidal mercury is removed either by passing live steam into the solution, or by means of steam heated tubes, or by single or multistage flash distillation. The process is especially useful for removing trace quantities of mercury from exhausted brine solutions from electrolysis cells with mercury cathodes. (Sandoski-FIRL)
W76-07627

REVERSE-OSMOSIS SYSTEM FACILITATES DISPOSAL OF USED CUTTING OILS.
Engineers' Digest, Vol. 34, No. 10, October, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, *Waste water disposal, Legislation, Waste disposal, Fuels, Incineration, Costs, *Oil wastes, *Reverse osmosis.
Identifiers: Cutting oils.

Since the cutting oils employed in machining operations are generally diluted with water in a ratio of about 20:1, problems arise not only in connection with the tanking and hauling of large volumes of liquid, but also with environmental legislation regarding the disposal of cutting fluids. A new disposal system, utilizing a reverse osmosis module with a tubular configuration, has been designed to remove about 95% of the water in the oil and most of the additives. The concentrated oil can then be burnt in heating or process furnaces. The calorific value of the concentrated cutting oil, from 5,000 to 10,000 BTU/lb, provides a fuel bonus. In addition, the water and additives extracted can be used to make up new batches of

cutting fluid, resulting in further cost savings. (Sandoski-FIRL)
W76-07628

WASTE-WATER BIOCHEMICAL PURIFICATION,
L. P. Aleksandrova, N. Ya. Zhdanova, and A. A. Bondarev.
Soviet Patent SU 372181. Issued May 4, 1973. Soviet Inventions Illustrated, Vol. U, No. 45, p D4, December, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Biological treatment, *Patents, *Biochemical oxygen demand, Fungi, Filtration, *Oxidation.
Identifiers: *Microfiltration, Activated sediment.

A method has been patented for the biochemical purification of waste water through oxidation by fungus cultures and microfiltration before treatment with activated sediment. The method may be applied to industrial waste water with biochemical oxygen demand up to 4 g/liter and pH 5-6 by using Fusarium solani var. argillaceum, Fusarium solani var. species, and Fusarium oxysporum. Waste water at pH 5.5 with a BOD of 4000 mg/liter was aerated 24 hours to reduce the BOD to 1000 mg/liter (75% purification). After filtration, the water was aerated for 16 hours to produce 98-99% purification. In the first stage, 0.05-0.3 g/liter fungus was used. In the second stage 3 g/liter activated sediment was added. (Sandoski-FIRL)
W76-07631

DISCONTINUOUS REMOVAL OF SOLVENT FROM POLYMER SOLUTIONS.
West German Patent DT 2050887. Issued October 25, 1973. Derwent German Patents Abstracts, Vol. U, No. 46, p A4, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, *Polymers, Water reuse, *Patents, Steam, Solvents.

A patent has been issued for the discontinuous removal of solvent from resinous polymer solutions in a single step. The hydrocarbon solution is mixed with water under vigorous stirring and the water is made to boil by injection of live steam. The temperature of the suspension is maintained between 70 C and the boiling point of water. The polymer solution is broken when the water-polymer ratio is maintained at 20:1-6:1. After more steam is added, the suspension is filtered, and the water (containing polymer in a ratio of less than one part polymer to 100 parts water) is recycled. (Sandoski-FIRL)
W76-07632

THE TREATMENT OF SPENT PICKLE LIQUORS CONTAINING MIXED METAL CHLORIDES.
Australian Patent 441,025. Issued October 18, 1973. Official Journal of Patents, Trade Marks and Designs, Vol. 43, No. 39, p 4195, October, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, Metals, *Patents, *Chlorides, Continuous flow, Hydrolysis.
Identifiers: *Waste pickling liquors, Counter-current flow, *Metal chlorides.

A method of treating spent pickle liquors containing from 20-160 grams/liter ferrous ions, from 1-150 grams/liter zinc, and from 5-70 grams/liter hydrogen chloride has been patented. The spent pickle liquors are contacted in a continuous counter-current manner with an anion exchange medium to remove zinc chloride. The quantitative flow rates of the anion exchange medium are adjusted so that all of the zinc will be absorbed. Chloride values are recovered from the resultant chloride solution by high temperature hydrolysis. (Sandoski-FIRL)
W76-07633

GENERAL CONSIDERATIONS ON THE CONDITIONS OF THE ADMISSION OF INDUSTRIAL EFFLUENTS INTO WASTE WATER TREATMENT PLANTS FOR TREATMENT TOGETHER WITH URBAN WASTE WATERS, AND ON THE CONTRIBUTIONS BY THE INDUSTRIES TOWARD THE TREATMENT COSTS (VUE GENERALE SUR LES CONDITIONS D'ADMISSION DES EFFLUENTS INDUSTRIELS DANS LES STATIONS D'EQUATION, POUR TRAITEMENT EN MELANGE AVEC LES EAUX USEES URABAINES, ET SUR LA PARTICIPATION INDUSTRIELLE AU COUT DE CE TRAITEMENT),
D. E. Bond.
Centre Belge d'Etude et de Documentation des Eaux, Vol. 26, No. 359, p 371-377, October, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Municipal wastes, Treatment facilities, Sewerage, Cost allocation, Water reuse, Costs.
Identifiers: Great Britain.

General conditions for the discharge of industrial waste water into municipal waste water treatment plants for treatment together with urban waste water, as well as the policy of required contribution by industries toward the treatment costs are surveyed with respect to the situation in Great Britain. According to a law enacted in 1961, local authorities have the right to specify the temperature and pH ranges of industrial waste water channeled into municipal sewer systems, and to measure its volume. Various formulae proposed for the calculation of the fees to be paid by industries for the conveyance, treatment, and disposal of their waste water include such parameters as waste water volume, BOD5 and COD levels, suspended matter content, the costs of sludge disposal, and investment costs for the waste water treatment plant. For practical reasons, however, fees are calculated on the basis of the COD levels. On the other hand, industries can be effectively encouraged to reduce their water consumption and to recycle their waste water by setting an adequate price on industrial water. (Takacs-FIRL)
W76-07634

EFFLUENT TREATMENT,
West German Patent DT 1560331. Issued October 25, 1973. Derwent German Patents Abstracts, Vol. U, No. 46, p F2-F3, October, 1973.

Descriptors: *Pulp wastes, *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Patents, Flocculation, Lime, Hydrogen ion concentration.

An effluent treatment process for use with material from paper manufacturing has been patented. In the clarification of waste water from paper manufacturing, especiaaly from graphic paper process, the conventional method involves adding lime and a flocculating agent such as aluminum sulfate. In this process, the effluent is treated with lime in a first stage under turbulent conditions to produce a pH greater than or equal to 9.0. The treated effluent is then passed to a second stage where the flocculant is added, lowering the pH to 6.8-8.5. (Sandoski-FIRL)
W76-07635

SEPARATION AND EFFLUENT TREATMENT BY ULTRASONICS,
Filtration and Separation, Vol. 10, No. 6, p 740, November/December, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Separation techniques, *Ultrasonics, Food processing industry, Screens, Pulp and paper industry, *Pulp wastes.

The first commercial unit of a novel ultrasonically-assisted separation system has now been installed to process the effluent in a sand washing plant. The system consists of a transducer array positioned underneath a sloping screen. The waste water to be treated is sprayed down the screen through a thin narrow orifice located at the top of the screen. Liquids pass through the screen, while solids travel down to be collected at its base. Experimentally approved application areas include the paper, sand, coal, and food industries. (Sandoski-FIRL)
W76-07636

RECOVERY OF KRAFT WHITE LIQUOR,
D. L. Caldwell.
Canadian Patent 937,707. Issued December 4, 1973. The Patent Office Record, Vol. 101, No. 38, p 20, December, 1973.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, *Patents, Alkalinity, Recycling.
Identifiers: *Kraft white liquor recovery.

A patent for the recovery of Kraft white liquor has been issued. While the green liquor is causticized, calcium sulfate is added. This produces a white liquor with a higher than normal active alkali content. Sodium hydroxide may also be added to the liquor to balance added sulfur content introduced by the CaSO4. This method eliminates the need for conventional Na2SO4 addition to the black liquor. (Sandoski-FIRL)
W76-07637

CHLORINE DIOXIDE PULP BLEACHING SYSTEM,
R. Marchfelder.
Canadian Patent 937,705. Issued December 4, 1973. The Patent Office Record, Vol. 101, No. 38, p 19, December, 1973.

Descriptors: *Pulp wastes, *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Patents, Waste disposal, Pollution abatement, Chlorine dioxide, Water reuse, Recycling.

A patent has been granted for a chlorine dioxide bleaching process that improves the efficiency of bleaching paper, reduces the consumption of chemicals, water, and heat, and minimizes waste disposal problems. The process includes a two-stage system for generating chlorine dioxide. Partially spent chemicals discharged from the primary generation stage are more completely reacted under controlled conditions in a dechlorination stage. The chlorine dioxide solution from the dechlorinator is contaminated, and it must be separately collected for use in the early pulp chlorination stages. The purer chlorine dioxide from the primary generator is reserved for use in the latter stages of pulp bleaching. The chloride content and corrosiveness of the spent reagents are minimized and underflow from the dechlorinator may be added to the black liquor recovery system, increasing the recovery of sulfides. Waste disposal problems and the consumption of water are also minimized by recycling free acid from the dechlorinator to the generator. Filtrate from the last stages of pulp washing is used as the absorption media in the chlorine dioxide absorption towers. (Sandoski-FIRL)
W76-07638

MINIMIZING CHEMICAL AND FINES BUILDUP IN WHITE WATER BY CHEMICAL MEANS,
Inst. of Paper Chemistry, Appleton, Wis.
D. G. Williams.
Tappi, Vol. 56, No. 12, p 144-147, December, 1973. 8 fig, 17 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Flocculation, Polyelectrolytes, Polymers, Adsorption, Coagulation.
Identifiers: Papermaking wastes, *Coflocculation.

The conditions necessary to minimize chemical buildup in white water of a papermaking process and to effect maximum retention of colloidal materials were examined. The coflocculation mechanism is most crucial as compared to sieving or mechanical attachment. Significant coflocculation is acheived through effecting the collapse of the electric double layers of the surface charged bodies with the provision of a suitable electrolyte concentration. The chemistry of aluminum salts in solution, the ability of its cations to effect coagulation, and the interference of complexing anions, such as sulfate, were discussed. Additional coflocculation is possible with the appropriate addition of a polyelectrolyte and the establishment of a polymer bridge. The success of the polymer retention aid is dependent upon achieving adsorption of polymer segments on the surfaces under conditions of low coverage and upon the ability of the created floc to withstand a shearing force in the process. Methods of implementing polymer adsorption and the effects of shear stress on flocculation in papermaking systems were also discussed. (Sandoski-FIRL)
W76-07639

OFFENSIVE ODOR TO BE REMOVED 99% BY OJI SYSTEM,
Japan Pulp and Paper, Vol. 11, No. 3, p 5, 1973.

Descriptors: *Pulp waste, *Waste water treatment, *Industrial wastes, Pulp and paper industry, Odor, Equipment, Biochemical oxygen demand, Incineration.
Identifiers: *Japan.

Oji Paper, Japan, has developed new odor abatement equipment with the trade name 'OK Stripping'. The unit can reduce 99% of offensive odor components in the waste water of the pulp and paper industry. At the same time, the system will remove 90% of the BOD in the wastes. The air and water with undesired odors are collected and then fed to a tower. In the tower, such materials as methanol and melkabutan are gasified by steam gas blown into the tower, and then incinerated. (Sandoski-FIRL)

A WATER QUALITY CONTROL PROGRAM,
Publishers Paper Co., Oregon City, Oreg.
C. Mayer, Z. Rozycki, and A. L. Caron.
Tappi, Vol. 57, No. 1, p 140-142, January, 1974. 5 tab.

Descriptors: *Waste water treatment, Pulp and paper industry, *Industrial wastes, Suspended solids, Biochemical oxygen demand, Treatment facilities, *Pulp wastes, *Oregon, Water quality control.
Identifiers: Municipal-industrial wastes, Willamette River(Ore).

Water quality conditions in the Willamette River, Oregon, required that the effluent load discharged by industrial and municipal sources be substantially reduced. Treatment systems were installed and an effective low-flow augmentation program was implemented. In-mill process changes were effected at the Newberg and Oregon City mills, first on a pilot scale and then construction over a five year period on a full plant scale. The result has been suspended solids and BOD reductions of 90 and 98%, respectively. New practices included conversion from calcium-base to magnelite pulp production, installation of a settleable solids removal system for white water, and the addition of an aerated stabilization basin system for removal of five-day BOD from mill effluents. (Sandoski-FIRL)

FILTRATION TECHNIQUES FOR PURIFICATION OF KRAFT PULP MILL AND BLEACH PLANT WASTES,
Oak Ridge National Lab., Tenn.
J. S. Johnson, Jr., R. E. Minturn, and G. E. Moore.
Tappi, Vol. 57, No. 1, p 134-138, January, 1975. 4 fig, 1 tab, 23 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Filtration, Reverse osmosis, Membrane processes, Membranes, Water reuse, Laboratory tests.
Identifiers: Ultrafiltration, Kraft pulping wastes, Cross flow.

Laboratory tests of filtration techniques for processing various kraft pulping streams were performed. The techniques included: high-pressure hyperfiltration (reverse osmosis) with dynamic membranes rather than conventional membranes, such as cellulose acetate; moderate-pressure, low-salt-rejection ultrafiltration; and filtration of chemically treated effluents at low pressures. In each case, the feed solutions were circulated parallel to the filtering surface; the cross flow method tends to reduce concentration polarization and inhibit fouling. Effluents tested included brown -stock wash, decker, and screen-room effluents, and bleach-plant effluent. For hyperfiltration, polyacrylate membranes formed on a sublayer of hydrous Zr(IV) oxide were used. In ultrafiltration, the membranes were single layers of hydrous Zr(IV) oxide or of neutral organic polymers. While results of these laboratory tests were encouraging, further research is necessary to determine if dynamic filtration techniques can successfully be applied to in-plant wastes. Costs will be a primary factor in determining the feasibility of these approaches. (Sandoski-FIRL)
W76-07643

THE PYROLYSIS OF EXTRACTED SOLIDS FROM OXIDIZED KRAFT BLACK LIQUOR AFTER LIGNIN PRECIPTIATION,
Lakehead University, Thunder Bay (Ontario). Dept. of Chemistry.
A. J. Bruley, W. G. Coodk, and R. A. Ross.
Canadian Journal of Chemical Engineering, Vol. 51, No. 6, p 746-750, December, 1973. 8 fig, 4 tab, 7 ref.

Descriptors: *Pulp wastes, *Waste water treatment, *Industrial wastes, Pulp and paper industry, Laboratory tests, Odor, Lignins, Chemical precipitation, Gas chromatography, Hydrogen sulfide, Analytical techniques, *Pollutant identification.
Identifiers: *Pyrolysis, Kraft black liquors, *Odor control.

A laboratory investigation was conducted on the possibilities for odor reduction from kraft mill stack gases by lignin precipitation from oxidized kraft black liquor and pyrolysis of the filtrate solids. Samples of oxidized black liquor were acidified with sulfuric acid and the lignin precipitate was extracted. The extraction scheme indicates that more than 90% of the sodium in the original black liquor samples can be retained in the filtrate after lignin removal at a final pH of 2.0. The evaporated filtrate solids containing the bulk of the black liquor inorganic chemicals were pyrolyzed; the evolved hydrogen sulfide, methyl mercaptan and dimethyl sulfide were monitored by gas-chromatography. A thermogravimetric technique was used to investigate the decomposition rates of the extracted samples. These rates correlated with the levels of sulfur gases evolved on pyrolysis. Heats of combustion were determined by bomb calorimetry. Sulfur losses from the filtrate solids and the kraft black liquor total solids were compared. Although the concentrations of organo sulfur gases from samples of lignin-extracted black liquor solids decreased through lignin precipitation, an increase in the level of hydrogen sulfide emission presents a problem for further research. (Sandoski-FIRL)
W76-07644

EFFLUENT STREAM TREATMENT.
French Patent FR 2173166. Issued October 5, 1973. Derwent French Patents Abstracts, Vol. U, No. 51, p F1, January 24, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, Pulp and paper industry, Resins, Flocculation, Polymers, Coagulation, *Pulp wastes.

An effluent stream treatment process using P-F resin solution and a water-soluble polyether was patented. Waste waters, particularly from paper and fiberboard production, were treated with a solution of a P-F resin. The resulting flocs were very rapidly coagulated in the presence of the polyether. This water-soluble compound had a molecular weight greater than 50,000 and was usually polyethylene oxide with a molecular weight greater than 100,000. Cellulose fibers could be effectively removed from effluent waters. (Sandoski-FIRL)
W76-07645

PURIFICATION OF WASTE WATERS,
French Patent FR 2172935. Issued October 5, 1973. Derwent French Patents Abstracts, Vol. U, No. 50, p D7, January 17, 1974.

Descriptors: *Pulp wastes, *Waste water treatment, *Industrial wastes, *Patents, Pulp and paper industry, Suspended solids, Biochemical oxygen demand, Flocculation, Chemical precipitation, Sedimentation, Water purification.

A patented method of purification of waste papers from forest products, paper, or cardboard industries is described. The waste water consists of two parts: one having a high content of suspended matter and low content of oxygen-consuming material; and the other part having a low content of suspended matter and high content of oxygen-consuming material. Purification consisted of treating the first part to remove suspended matter. The residual liquid was then added to the second part. Precipitation agents were also added and the liquid was subjected to physical flocculation. Sedimentation and flotation products could be re-used in the process. Costs of the process and equipment were low, and small quantities of waste water could be treated. (Sandoski-FIRL)
W76-07646

FRESH AND WASTE WATER TREATMENT BY MEANS OF REVERSE OSMOSIS AND ULTRAFILTRATION AS COMPARED WITH OR AS A SUPPLEMENT TO THE ION EXCHANGE PROCEDURE (FRISCH UND ABWASSERAUFEREITUNG MIT UMGEKEHRTER OSMOSE UND ULTRAFILTRATION IM VERGLEICH MIT ODER ZUR ERGRENZUNG DER IONENAUSTAUSCHTECHNIK),
K. Marquardt.
Oberflaeche/Surface, Vol. 14, No. 11, p 338-341, November, 1973. 5 fig, 3 tab.

Descriptors: *Waste water treatment, *Industrial wastes, Metals, *Reverse osmosis, *Ion exchange, Dyes, Membrane processes, Hydrogen ion concentration.
Identifiers: *Ultrafiltration, *Metal processing wastes.

Possibilities of reverse osmosis and ultrafiltration either as self-contained processes or as supplements to ion-exchange procedures in the treatment of waste waters generated by the metal processing and surface coating industries are described. Reverse osmosis is suitable for the recovery of valuable substances from effluents without the use of excess amounts of chemicals, and in a rather low temperature range. The retention of zinc from zinc chloride-containing solutions was found to increase with decreasing pH values. The nitrate ion retention, highest (80-86%) in a pH range of 7-11.1, is also strongly dependent on the pH value, while the retention of ammonium ions is practically independent from the pH value in a range of 3.2-6.9. The highest retention rate determined for phenol in the pH range below 10 was 55%, it increased to 95% at pH 11. Ultrafiltration, possibly combined with reverse osmosis, is suitable for the separation of dyes, tensides, and higher-molecular alcohols. Contaminant concentrations exceeding one percent require multi-stage reverse osmosis units. (Takacs-FIRL)
W76-07647

TREATMENT METHOD FOR HEAVY METAL CONTAINING LIQUID WASTE (JUKINZOKU GANYU HAISUI NO SHORIHO),
M. Nakagawa.
PPM, Vol. 5, No. 2, p 50-56, February, 1974. 11 fig, 2 tab, 8 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Heavy metals, Iron, Evaporation, Sludge treatment, Recycling, Mercury, Adsorption, Liquid wastes.
Identifiers: *Metal finishing wastes, Cyanides.

For effective treatment of liquid wastes produced from metal surface treatment industries, waste liquid and sludge should be grouped into four systems: ferrous acid group and alkaline cleansing; non-ferrous acid group and alkaline cleansing; chromium; and cyanides. Cyanide wastes are first degraded by oxidation. The pH is then adjusted, chromium hydroxide is settled, and the supernatent liquid is discharged. For recovery of heavy metals from sludge, a dry method or wet method is applied. For sludge with a high iron content, the dry method of chlorination evaporation is effective. Calcium chloride is added to the sludge, which is then pelletized and roasted at a temperature over 1000 C; thus precious metals are recovered. For sludges with valuable metals other than iron, preliminary separation of metals by the wet method is desirable. First, the sludge is dissolved in sulfuric acid; or, when sludge has some iron, the iron should be suspended in water before being dissolved, and oxidized into ferric salt. Alkali is added to sulfuric acid solution and pH is adjusted to 1-2, gypsum is settled and eliminated, pH is readjusted to 3.5-4, and most iron settles in the form of basic salt. After iron is separated, the liquid is readjusted to pH 9-10, and zinc hydroxide is settled. When salt concentration is increased, the liquid can be used for producing mirabilite. If after eliminating gypsum the liquid is red in color because of a high chromium content, sulphite is added and the color is turned green; iron is settled, and zinc and chromium are settled together. Mercury-containing liquid and sludge are treated by sulfide ion, and mercury is recovered as mercury sulfide. (Seigle-FIRL)
W76-07648

REMOVAL OF COPPER FROM LIQUID EFFLUENTS,
Netherlands Patent NL 7206835. Issued November 21, 1973. Derwent Netherlands Patents Abstracts, Vol. U, No. 50, p D1, January 17, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, *Copper, Ammonia, Activated carbon, Reduction(Chemical), Liquid wastes.

A method for removal of copper from liquid effluents by treatment with ammonia and a reducing agent is described. The effluents are treated by: adding excess ammonia; adjusting the pH of the ammoniacal solution to greater than or equal to ten; and adding excess reducing agent to form a copper-containing removable sludge. Excess ammonia is added to form the copper-ammonia complex, the mixture is adjusted to pH greater than or equal to twelve with NaOH, and excess hydrazine is then added to form the sludge. After separating the sludge, the filtrate is treated with active charcoal to improve copper and excess reducing agent removal. The treated effluent may be discharged safely without danger to aquatic life or plants. (Sandoski-FIRL)
W76-07649

TREATMENT OF EFFLUENTS,
French Patent FR 2174256. Issued October 12, 1973. Derwent French Patent Abstracts, Vol. U, No. 51, p D5, January, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, *Heavy metals, Waste water disposal, Waste disposal.

A method of treating effluents containing heavy metals by a combination of high molecular compounds, concentration, and solidifying, was patented. Industrial effluents containing heavy metals in dissolved or powder form can be treated by mixing them with a liquid containing a high molecular water-soluble compound, such as polyvinyl alcohol, methyl cellulose, carboxy methyl cellulose, sodium alginate or sodium cellulose xanthate. The mixture is then concentrated by heating. After cooling, a solid layer containing the heavy metals will be produced, which is easily disposed. (Sandoski-FIRL)
W76-07650

HEAVY METAL RECOVERY METHOD AND TREATMENT OF PLATING LIQUID WASTE (MEKKI HAISUICHU NO JUKINZOKU KAISHU TO SONO SHORI),
H. Okuda.
PPM, Vol. 5, No. 2, p 44-49, February, 1974. 8 fig.

Descriptors: *Heavy metals, *Waste water treatment, *Industrial wastes, Metals, Membrane processes, Membranes, Reverse osmosis, *Ion exchange, Resins, Cation exchange, Anion exchange.
Identifiers: *Metal finishing wastes, *Japan, Metals recovery.

For treatment of liquid waste and metal recovery for the plating industry, the natural recirculation method, forced circulation method, single effect evaporator, multiple effects evaporator, and the steam compressor evaporator were discussed. The reverse osmosis, ion exchange resin, and condensation settling methods were compared. Reverse osmosis is still in the experimental stage in Japan. Liquid wastes containing metal salts are pressured at 40-70 kg/sq cm and passed through a membrane. The most widely used membrane is acetyl-cellulose; this is highly permeable for liquid and retains salt well, but it deteriorates quickly in a strong acid or strong basic solution. In a laboratory test, the nickel elimination rate for the plating liquid waste was approximately 99%; sulfuric acid radicals and chlorine ions can be eliminated up to 99%. However, the elimination of boric acid was only 30%. Therefore, when returning nickel salt to the plating bath, the boric acid content must be adjusted. In the ion exchange resin method of recovering metals, resin that has reached its exchange capacity is regenerated. For cation exchange resin, hydrochloric acid or sulfuric acid is used and for anion exchange resin, caustic soda is used. The recovery of chromium is effective by this method. When treating sludge, chromic acid solution is mixed with acid and the pH is adjusted to less than 3; sodium bisulfite is added and chromic acid is reduced; caustic soda is added and neutralized; chromium hydroxide concentrate is then produced, which can be filtered directly. (Seigle-FIRL)
W76-07651

COALESCENCE OF OLEOPHILIC LIQUID/WATER DISPERSIONS,
Netherlands Patent NL 7300380. Issued November 27, 1973. Derwent Netherlands Patents Abstracts, Vol. U, No. 50, p J1, January 17, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, Oil, *Coalescence, *Ion exchange, Resins, Oil pollution, Emulsions, *Separation techniques, Dispersion, Exchangers.
Identifiers: *Oil/water separation, Oleophilic wastes.

A patented method for causing coalescence of oleophilic liquid/water dispersions using ion-exchanger beds is described. The coalescence of a dispersion of water and an oleophilic liquid is achieved by passing the dispersion through a bed of ion-exchange resin particles which have been equilibrated in relation to sorption of the oleophilic liquid. The dispersion may be one of a liquid petroleum hydrocarbon in water, and is passed upwards through the ion-exchange bed. The ion-exchange resin should be a strongly basic anion exchanger comprising quaternary ammonium groups attached to a styrene/divinylbenzene copolymer and/or a strongly acid cation exchanger comprising SO3H groups attached to a styrene/divinylbenzene copolymer. The process was especially useful for removing oil from waste waters and discharge from oil tankers. (Sandoski-FIRL)
W76-07652

APPARATUS FOR REMOVING SURFACE FILMS FROM LIQUIDS,
Peabody Engineering Corp., N. Y. (Assignee).
O. M. Arnold, and C. A. Vancini.
United States Patent 3,789,586. Issued February 5, 1974. Official Gazette of the United States Patent Office, Vol. 919, No. 1, p 55, February, 1974. 1 fig.

Descriptors: *Patents, *Waste water treatment, Scum, Waste disposal, *Separation techniques.
Identifiers: Funnels.

An apparatus to remove surface films from liquids was patented. A funnel located below the surface of a liquid and movable across the container was placed in a reservoir. A liquid jet arranged to cause the surface film or foam to flow into the funnel from which it is discharged to the outside was also provided. (Sandowski-FIRL)

RECOVERY OF CHEMICALS FROM SULFITE WASTE LIQUORS BY MEANS OF ELECTRODIALYSIS (CHEMIKALIENRUECKGEWINNUNG AUS SULFITABLAUGEN MIT DER METHODE DER ELEKTRODIALYSE),
J. N. Nepenin, and B. N. Filatow.
Zellstoff und Papier, Vol. 22, No. 11, p 331-335, November, 1973. 9 fig, 4 tab, 10 ref.

Descriptors: *Ion exchange, *Chemical industry, *Industrial wastes, *Waste water treatment, *Laboratory tests, *Electrodialysis, Membrane processes, Pulp and paper industry, Sulfite liquors, Recycling, Pulp wastes.
Identifiers: *Chemicals recovery.

The possibility of the chemical recovery from sodium-base sulfite liquor residues by means of electrodialysis with simultaneous fractionation of the lignosulfonic acids was studied in laboratory experiments. It was possible to recover chemicals with simultaneous fractionation of the residues from yeast recovery by electrodialysis, using ion

exchange membranes. The energy consumption was found to be lowest (50 kWh/kg of sodium), and the separation efficiency highest (60%) at a residue concentration of 30% dry matter, which is most probably due to a maximum of the electric conductivity of the residue at this concentration. The optimum current density was determined to be 50 ma/sq cm. An increase in the residue temperature from 20 to 80C resulted in an increase in the rate of sodium regeneration by 46 to 69%, an increase in the separation efficiency by 32 to 50%, and a decrease in energy consumption by nearly four times. To prevent backward diffusion from occurring, multi-stage operation with a maximum rate of sodium regeneration in the first stage of 74% is necessary. The increase observed in the electrophoretic mobility of the lignosulfonic acids from 1.48 to 3.84 cm/sV with a decrease in their molecular weight from 30,000 to 1,630 indicates the possibility of their fractionation in the electric field. A ten-chamber arrangement of the ion exchange membranes was preferred. (Takacs-FIRL)

GALLIUM ARSENIDE WASTE TREATMENT METHOD,
H. F. Bell, and G. Calley.
IBM Technical Disclosure Bulletin, Vol. 16, No. 8, p 2649, January, 1974.

Descriptors: *Industrial wastes, *Waste water treatment, Alkalinity, Liquid wastes, Chemical precipitation, Filtration, Chemical wastes.
Identifiers: *Gallium arsenide treatment, *Arsenic removal, Gallium.

The use of standard treatment procedures on waste gallium arsenide solutions did not result in consistent arsenic removal, and removed only 15% of the gallium in the waste. The following procedure takes into account the presence of hypochlorite and carbonate in the waste liquid, which cause the erratic results when the waste is treated in the conventional manner. First, alkaline waste is treated with 30% hydrogen peroxide to destroy all sodium hypochlorite present. Concentrated hydrochloric acid is then added to lower the pH to four, after which the solution is allowed to stand (with agitation) until the carbonate decomposes. The pH is then raised with lime (pH about 12) to precipitate the gallium and arsenic. Ferric chloride is added at this point to aid in the precipitation process. Finally, the material is filtered. (Sandoski-FIRL)
W76-07655

IN-PLANT WASTE ABATEMENT,
Allied Chemical Corp., Morristown, N.J.
W. M. Reiter, and W. F. Stocker.
Chemical Engineering Progress, Vol. 70, No. 1, p 55-59, January, 1974. 7 fig, 1 tab.

Descriptors: Chemical industry, *Waste water treatment, Lagoons, Suspended solids, *Recycling, Effluents, Treatment facilities, *Industrial wastes, Water reuse, *Chemical wastes, Mississippi River.
Identifiers: Alum, Phosphoric acid, Hydrofluoric acid, Zero discharge.

Allied Chemical has eliminated waste discharges from an alum plant, and is currently evaluating techniques for achieving zero discharge from its phosphoric acid and hydrofluoric acid facilities. To reduce discharge into the Mississippi River near New Orleans, a two-pond containment system was installed, pumping wastes to the first lagoon where suspended solids are removed, then to the second which functions as a clear well. The water goes back into the process as make-up for subsequent batches, completing a closed-loop operation. A recycling method for transport water used in HF manufacture involves neutralization of slurry and scrubber effluent; another treatment method being used in HF manufacture is dry handling of the HF furnace residue with concomitant elimination of aqueous waste. In the manufacture of phosphoric acid for fertilizer applications, acidulation of tricalcium phosphate is the main reaction. Acid water effluent from the process may be recycled with a 96% effectiveness. (Sandoski-FIRL)
W76-07656

INDUSTRIAL WASTE WATER TREATMENT.
Belgian Patent BE 799901. Issued January 24, 1974. Derwent Belgian Patents Abstracts, Vol. U, No. 51, p D2, January, 1974.

Descriptors: *Patents, *Industrial wastes, *Waste water treatment, *Electrolytes, Electrodes, Heavy metals.
Identifiers: *Cyanides, Electrolytic cells.

A patent for industrial waste water treatment using an electrolytic cell, applicable to the extraction of cyanides, was granted. A number of rows of parallel bar auxiliary electrodes are located between principal parallel plate electrodes. These form two side walls of the cell and increase the effective area of the electrochemical active surface. Thus, the voltage applied can be reduced, giving a higher efficiency due to reduction of gases. The bars are alternate carbon for the extraction of the cyanide, and a metal alloy which electrically dissolves the hydroxide of its own metals. Heavy metal ions are therefore extracted, and supported in an open box structure. (Sandoski-FIRL)

PLASTIC FILTERS FOR THE PURIFICATION OF DAIRY PRODUCT PROCESSING-GENERATED WASTE WATERS (KUNSTOSTOF FILTER-MODULES VOOR DE ZUIVERING VAN AFVALWATER, AFHOMSTIG VAN DE ZUIVELVERWERKING),
M. L. Hemming.
Voedingsmiddelentechnologie, Vol. 4, No. 47, p 34-35, November 21, 1973. 1 fig, 1 tab.

Descriptors: *Food processing industry, *Waste water treatment, *Biochemical oxygen demand, *Filters, Equipment, Plastics, Oxidation, Activated sludge, Industrial wastes, *Dairy industry, Filtration.
Identifiers: Polyvinyl chloride, Biofilters, BOD5.

The suitability and use of filter modules made of plastic materials for the purification of dairy-generated waste waters with high BOD5 loads are described. While older designs were made mostly of polyethylene, the modules are now made of polyvinyl chloride. Plastic filter modules are suitable for the treatment of dairy-generated waste waters in oxidation towers (percolation filters), and in conventional activated sludge units. For the percolation filters, the minimum input capacity is 1.47 cu m/sq m/h. Oxidative filtration by means of plastic filter modules can reach efficiencies of 90% or more in terms of BOD5 reduction. (Takacs-FIRL)
W76-07659

NEW ULTRAFILTRATION SYSTEM USES INORGANICS.
Chemical Engineering News, Vol. 52, No. 4, p 24-25, January 28, 1974. 1 fig.

Descriptors: *Membrane processes, *Industrial wastes, *Waste water treatment, Polymers, Food processing industry, Algal control, *Inorganic compounds, Economics, Carbon.
Identifiers: *Ultrafiltration, Ucarsep process.

Union Carbide has incorporated inorganic substances into its commercial ultrafiltration system called Ucarsep. Ucarsep consists of standard modules made up of bundles of porous carbon tubes coated on the inside with a series of inorganic compositions. The standard moddule is six inches in diameter and contains 151 tubes four feet long with a total working area of 37.5 square feet and daily production of 2,000 to 5,000 gallons of filtrate. Among its useful characteristics are ability to: process particles in the size range of 10 to 50 angstroms, and large polymer molecules of 10,000 to 50,000 molecular weight; and process material up to 200F, at a pH of 2 to 14, and a feed pressure of 600 p.s.i. Future applications include cheese whey protein recovery, latex concentration, detergent solution reuse, water recovery from black liquor, and algae removal. (Sandoski-FIRL)
W76-07660

METALFINISHING GETS AN ECOLOGICAL BOOST,
R. R. Irving.
Iron Age, Vol. 213, No. 5, p 50, February 4, 1974. 1 fig.

Descriptors: *Metals, Water pollution control, *Filtration, *Membrane processes, *Waste water treatment, Installation, Oil wastes, Carbon, Inorganic compounds, Pre-treatment(Water).
Identifiers: *Ultrafiltration, Ucarsep system, Metalfinishing wastes.

A new ultrafiltration process has been developed by the Union Carbide Corporation, called Ucarsep. The unit consists of carbon tubes, and the inner diameter of each tube is coated with an inorganic membrane. The process has been successful in treating wastes found in metal-working, particularly automotive and appliance manufacturing, and in coil coating. The system is being used on production lines for removal and concentration of oil from pre-paint detergent cleaning baths, oily waste streams and phosphating cleaning linesx. Oil is removed from a cleaning solution before it reaches the wate water treatment system. The typical 6000 gpd Ucarsep system, including pumps, controls, and modules can be mounted on a 2 ft by 4 1/2 ft base, and payback will range from less than six months to two years. (Sandoski-FIRL)
W76-07661

EFFECT OF TEMPERATURE ON CANNERY WASTE OXIDATION,
North Texas State Univ., Denton. Dept. of Microbiology.
G. R. Vela.
Journal Water Pollution Control Federation, Vol. 46, No. 1, p 198-203, January, 1974. 2 fig, 2 tab, 5 ref.

Descriptors: *Food processing industry, *Waste water treatment, *Waste disposal, *Biological treatment, Environmental effects, Irrigation, Microorganisms, Temperature, Bacteria, *Oxidation.
Identifiers: *Land disposal, Living filter system, Spray irrigation.

A spray irrigation waste disposal system developed by the Campbell Soup Company at Paris, Texas, was examined. Wastes from food processing (the cannery) are discharged into the soil, with a retention time of about 24 hours. Purification is the result of microbiological activity in the disposal field. The relationships between temperature, the growth of bacteria in soil, and oxidation of the waste water were illustrated. It was determined that the soil in the area of the disposal field had an autochthonous bacterial population, including obligate psychrophiles and obligate thermophiles. While these organisms contribute to the oxidative degradation of the plant waste water at extremes of temperature, the major portion of the oxidative capacity of the soil microflora came from the metabolic activities of the mesophilic

bacteria. The system, therefore, functions over a wide range of temperatures. (Sandoski-FIRL)
W76-07662

MUDDY WATER TREATMENT SYSTEM FOR AGGREGATE PLANT, (IN JAPANESE),
H. Ishii, and F. Komatsu.
Kobe Steel Engineering Reports, Vol. 24, No. 1, p 122-126, January, 1974. 7 fig, 3 tab.

Descriptors: *Mining, *Filters, Liquid wastes, Pilot plants, *Waste water treatment, Chemical precipitation, *Industrial wastes, Aggregates, Dewatering.
Identifiers: Japan.

Muddy water treatment in a closed system for the spiral classifier overflow of an aggregate crushing plant is described. The pollutants are the clay, top soil, and microparticle rock powder crushed in various crusher machines of the plant, more than 90 percent of which are less than 200 mesh (0.074 mm) particles. The concentration of solid in the liquid is extremely high (30,000-70,000 ppm). The solid amounts emitted are 1.5 tons per hour to 50 tons per hour at peak times. This creates a tremendous amount of slurry requiring precipitation and dehydration treatment. The precipitation separation divides the liquid into 20-40 percent slurry and supernatent liquid; slurry is then made into 50-80 percent solid cake by the dehydrater. Equipment of the closed muddy water treatment system designed by Kobe Steel, Japan, was described. The liquid waste treated in this completely closed system is never discharged outside the plant. Results of a preliminary test and the pilot plant were presented in tables and graphs. (Seigle-FIRL)
W76-07664

MAGNETIC SEPARATIONS NEAR MARKET BREAKTHROUGH.
Chemical and Engineering News, Vol. 52, No. 4, p 21-24, January 28, 1974.

Descriptors: *Pulp wastes, *Separation techniques, Pulp and paper industry, *Industrial wastes, *Waste water treatment, Potable water, Viruses, Magnetic studies, Steel.
Identifiers: High gradient magnetic separation(HGMS), *Magnetic separation.

High-gradient magnetic separation (HGMS) is a new and promising technology which may prove to be applicable in a wide variety of fields. The first and only commercial application of HGMS was in the clay industry. However, successfully tested HGMS units have been used in connection with paper mills, steel mills, and other industrial plants. Nonmagnetic impurities in effluents can be seeded to form magnetic agglomerates. Also, a cooperative effort by Harvard and MIT is being undertaken to remove viruses from drinking water by HGMS. (Murphy-FIRL)

A SOLUTION OF TRANSIT PROBLEMS ARISING IN PIPES CARRYING ENCRUSTATING AND SEDIMENTATING WASTE WATERS (LOESUNG VON TRANSPORTPROBLEMEN BEI INKRUSTIERENDEN UND SEDIMENTIERENDEN ABWASSERN IN ROHRLEITUNGEN),
W. Kuhn.
Gas-Wasserfach/Wasser-Abwasser, Vol. 114, No. 11, p 530-537, November, 1973. 11 fig, 7 ref.

Descriptors: *Pipes, *Pipelines, *Sewers, *Tannery wastes, *Waste water treatment, Cleaning, Treatment facilities, Odor, Economics, Industrial wastes.
Identifiers: *Leather factory wastes.

A solution to the problem of the conveyance of leather factory waste waters carrying encrusting and sedimenting materials in pressurized sewer pipes to a waste water treatment plant is described. Since an open sewer was unsuitable due to malodorous emissions from the effluents, pressurized sewer pipe with an inner diameter of 500 mm was chosen. To prevent encrustation and sedimentation inside the sewer pipes, these pipes were designed for regular cleaning by means of sewer scraper. Sewer scraping proved to be both economical and reliable. (Takacs-FIRL)
W76-07666

TREATING INDUSTRIAL WASTE WATER.
Belgian Patent BE 799386, Issued January 3, 1974.
Derwent Belgian Patents Abstracts, Vol. U, No. 48, p D1, January, 1974.

Descriptors: *Pulp wastes, *Patents, *Industrial wastes, *Waste water treatment, Pulp and paper industry, Chemical precipitation, Cellulose, Pretreatment(Water), Tannery wastes, Textiles, Filters.

A new method of treating industrial waste water with a cellulose-containing precipitating agent is described. Waste water is purified by contacting it with a cellulose-containing absorbing material which has been pretreated with a precipitating agent. The cellulose is generally in the form of a filter, pretreated with a polyanionic precipitating agent such as a dicyandiamide-formaldehyde or dicyandiamide urea-formaldehyde condensation product, alkylenepolyamines or dipolyamidepolyamidines made by reacting polymerized fatty acids with polyamines. The products are useful for removing impurities such as anionic dyes or optical bleaches from spent baths in the textile, paper and leather industries. (Murphy-FIRL)

THE SCAM (THE ENTERPRISES OF THE ELECTRO-MECHANICS COMP) AND THE RECYCLING OF INDUSTRIAL WATERS (LA SCAM ET LE RECYCLAGE DES EAUX INDUSTRIELLES).
Industires Alimentaires et Agricoles, Vol. 90, No. 9/10, p 1307, September/October, 1973. 1 fig.

Descriptors: *Industrial wastes, *Waste water treatment, *Recycling, Cooling water, *Water reuse, Water consumption.
Identifiers: Zero discharge.

Equipment for the cooling of industrial waste waters to be recycled is described. The atmospheric cooler operating in a closed cycle, and providing for direct contact between the waste water to be cooled and the air, has a water consumption amounting to only 2% of that of an open-cycle cooler. The minimum capacity of the unit lies at 70 cu m/h. Water consumption, and also direct contact between the water and the air can be fully suppressed by the use of another cooler composed of finned tube bundles. (Erdelyi-FIRL)

TERRITORY, INDUSTRIAL PLANTS, WATER SUPPLY, AND WASTE WATER PLANTS--PARTNERS IN JOINT INVESTMENTS (TERRITORIUM, INDUSTRIEBETRIEB UND VEB WAB--PARTNER GEMEINSAMER INVESTITIONEN),
F. Dimitrovici.
Wasserwirtschaft-Wassertechnik, Vol. 23, No. 12, p 423-426, 1973. 2 fig, 2 ref.

Descriptors: *Waste water treatment, Water supply, *Industrial wastes, *Biological treatment, Sludge treatment, Economics, Flocculation, Water treatment, Water purification.
Identifiers: Municipal-industrial wastes, Dyeing wastes, Chemical treatment.

A large dyeing plant and the public authorities for water supply and communal water purification in Erfurt, Germany, agreed on the joint treatment of the dyeing waste water along with domestic waste water for economical reasons. The following process stages were selected: balancing of the concentration of the dyeing waste water in the factory; mechanical and chemical purification of the dyeing waste water along with the domestic waste water; and sludge treatment and drying. The domestic waste water carries an organic load of 200 to 300 mg/liter; the industrial waste water after discoloration, 600 to 800 mg/liter at a temperature of 30 to 45 C. For mechanical purification, a long sand trap with hydromechanical removal of the solid matter was selected. For chemical purification, magnesium chloride lye is added for flocculation. Through addition of lime milk the pH of the waste water is raised from less than seven to more than ten. A uniform temperature of less than 35C is maintained throughout this process. The sludge from chemical treatment is dehydrated and then dried in drying beds. Of the 60 drying beds, 55 are used for industrial sludges and five for domestic sludges. The biological stage is supplied with waste water from the mechanical and chemical stages, and comprises three basins. (Erdelyi-FIRL)

DEVELOPMENT OF DESIGN GUIDELINES FOR SHIPBOARD SEWAGE HOLDING TANKS.
Abatement and Compliance Branch, Water Pollution Control Directorate Environmental Protection Service, Environment Canada, Ottawa, Canada, Economic and Technical Review Report EPS 3-WP-76-3, March, 1976, 101 p., 25 fig., 7 tab, 28 ref.

Descriptors: *Ships, *Design, *Sewage treatment, Operation and maintenance, Great Lakes, St. Lawrence River, Domestic wastes, Aerobic bacteria, Effluents, Sludge, Suspended solids, Waste water(Pollution), Costs, *Canada, Treatment facilities, Waste water treatment.
Identifiers: *Sewage holding tanks, Vessels, Grey waters, Flush waters.

A detailed study is presented of shipboard sewage holding tanks suitable for vessels engaged on the Great Lakes - Lower St. Lawrence River trade route. A range of designs has been developed to meet the needs of most ship types, crew sizes, trading patterns, stability criteria and sewage collection systems. Construction, operation, maintenance and safety aspects are analyzed with a view to optimizing the economic impact on vessels that choose total retention as a method of satisfying the requirements of the Great Lakes Sewage Pollution Prevention Regulations. DEVELOPMENT OF DESIGN GUIDELINES FOR SHORE -SIDE HOLDING TANKS.
T. A. Constantine, and P. J. Osmond.
Water Pollution Control Directorate, Environmental Protection Service, Environment Canada, Ottawa, Canada, Economic and Technical Review Report EPS 3-WP-76-2, January, 1976, 48 p, 4 fig, 1 tab, 3 ref.

Descriptors: *Design criteria, *Ships, Sewage, *Sewage treatment, Water pollution, Design, Capital costs, Operation and maintenance, Economics, Cost-benefit analysis, Water pollution sources, *Waste water treatment, *Treatment facilities.
Identifiers: *Holding tanks, Environmental protection.

Requirements for shore-side holding tanks receiving sewage collected on board vessels are discussed. Preliminary designs for a basic system and two variations are developed and capital cost estimates are presented. Operating procedures are outlined and estimated annual operating costs for the shore-side holding tank installations are provided. The main conclusion is that properly designed holding tank facilities will be very expensive to construct and operate and that, if possible, direct transfer of the sewage from the vessel to a shore-side sewer or treatment facility should be undertaken. If holding tanks are required, the system denoted as Alternative No. 3 is probably the most acceptable. (Environment Canada)

INVENTORY OF CANADIAN COMMERCIAL SHIPS ON THE GREAT LAKES.
Water Pollution Control Directorate, Environmental Protection Service, Environment Canada, Ottawa, Canada, Economic and Technical Review Report EPS 3-WP-76-1, January, 1976, 62 p, 17 fig., 7 tab., 2 append.

Descriptors: *Water treatment, *Waste water treatment, *Ships, Water pollution sources, *Great Lakes, Design criteria, Operation and maintenance, Prototypes, Testing, Model studies, On-site investigations, Systems analysis, *Canada.
Identifiers: Flow equalization, Carbon adsorption, Bio-oxidation, Clarification, Multimedia filtration, Ozonation.

Data contained in replies to questionnaires submitted to shipping companies are analyzed. The questionnaires were designed to produce an inventory of Canadian commercial ships operating in the Great Lakes / St. Lawrence Seaway region, their operating companies, the major characteristics of each ship, and the extent of vessel waste control problems in the area under study. A statistical breakdown of the questionnaire replies was made in an attempt to provide numerical data which may prove useful for other related studies. (Environment Canada)

FACTORS AFFECTING ACTIVATED SLUDGE TREATMENT OF KRAFT BLEACHERY EFFLUENT,
Department of the Environment, Ottawa (Ontario).
P. H. M. Guo, W. K. Bedford, and B. E. Jank.
Technology Development Report EPS 4-WP-76-1, 22nd Annual Ontario Industrial Waste Conference, Toronto, February 1976, 30 p., 11 fig., 7 tab., 16 ref.

Descriptors: *Sludge treatment, *Effluents, *Pulp and paper industry, *Treatment facilities, Waste water(Pollution), Sludge, Temperature, Aeration, Toxicity, Suspended solids, Bleaching wastes, Hydrogen ion concentration, *Waste water treatment.
Identifiers: Bleacheries, Detoxification, Kraft bleachery effluents, Sludge flocs, Nutrient addition, Pulp and paper mills.

Although activated sludge systems are used in the treatment of pulp and paper mill effluents, many factors which could affect their design and operation have not been identified. Extensive bench scale and pilot scale experimentation involving activated sludge treatment of kraft bleachery effluent have revealed a number of important factors related to the performance of the treatment systems. Bioassays carried out to investigate factors affecting the toxicity of kraft bleachery effluent during storage indicated that toxicity reduction was closely related to the sample pH. There was a significant detoxification of neutralized bleachery effluent samples during an eleven-day storage period. Aeration enhanced the rate of detoxification but the influence of storage, temperature and nutrient addition was negligible. Temperature significantly affected the concentration of effluent suspended solids of activated sludge systems treating kraft bleachery effluent. The study demonstrated that deterioration of effluent quality occurred at operating temperatures equal to or greater than 35 C. Increased effluent suspended solids were related to a continuous rising of pin-point flocs which was considered to be partially due to a temperature gradient in the clarifier. Elimination or inversion of the temperature gradient in the clarifier was successful in controlling the pin-point floc problem. (Environment Canada)

'CABOS' - NEW WASTEWATER TREATMENT SYSTEM FOR VESSELS,
Ontario Research Foundation, Sheridan Park.
H. Lomas, and A. R. Townshend.
Water Pollution Control Directorate, Environmental Protection Service, Environment Canada, Ottawa, Canada, Technology Development Report EPS 4-WP-76-2, February, 1976, 66 p, 12 fig., 15 tab, 9 ref., 2 append.

Descriptors: *Waste water treatment, *Ships, Water pollution sources, Great Lakes, Design criteria, Operation and maintenance, Prototypes, Testing, Model studies, On-site investigations, Systems, *Canada.
Identifiers: Flow equalization, Carbon adsorption, Bio-oxidation, Clarification, Multimedia filtration, Ozonation.

A system was designed for the treatment of black and grey water from commercial vessels to meet effluent quality requirements for undiluted discharge into the Great Lakes and other water bodies. Laboratory units and pilot plant models were constructed at the Ontario Research Foundation and tested under simulated shipboard conditions. The results of these tests were used in the design of a prototype unit which was constructed and installed aboard the SS John A. France, a bulk carrier owned and operated by Scott Misener Steamships Limited. The system incorporates flow equalization, carbon adsorption bio-oxidation, clarification, multimedia filtration, and ozonation. It is called the CABOS system. Operations such as cleaning of the clarifier and backwashing of the filter are controlled automatically. Field testing and system evaluation under actual shipboard conditions will be undertaken during the 1975 sailing season. (Environment Canada)

DYNAMICS OF THE PURIFICATION OF DOMESTIC FECAL SEWAGE ON SEWAGE FARMS, (IN RUSSIAN),
Nauchno-Issledovatelskii Institut Epidemiologii, Mikrobiologii i Gigieny, Vilnius (USSR).
A. K. Baubinas, and V. V. Vlodavets.
Gig Sanit. 4, p 100-101, 1974.

Descriptors: *Sewage treatment, *Waste water treatment, Domestic wastes, *Sprinkling irrigation, Salmonella, Shigella, *Pathogenic bacteria, Epidemiology, Drainage, Water purification.
Identifiers: Salmonella-Eastbourne, Salmonella-Heidelberg, Shigella-Sonnei.

The dynamics of purification of domestic sewage on sewage farms with overhead sprinkling irrigation was studied. The most intense purification of sewage from chemical and bacterial contaminants occurs within the 1st hours after irrigation. Reliable purification of the sewage from pathogenic microorganisms (Salmonella eastbourne, Salmonella heidelberg, Shigella sonnei) is not provided in the case of overhead irrigation at a rate of 350 m3/ha on the sewage farms during maximum runoff of the drainage water, and the discharge of such runoffs into surface waters is epidemiologically hazardous. A decrease of the irrigation rate, increase of the filtering layer of soil and reuse of the drainage runoffs would promote an increase of the effectiveness of treating sewage on sewage farms.--Copyright 1975, Biological Abstracts, Inc.

METHOD OF ELECTROLYTIC TREATMENT OF WASTE WATER,
Mitsui Mining and Smelting Co. Ltd., Tokyo(Japan). (Assignee).
M. Ishii, and M. Ichiki.
United States Patent 3,783,114. Issued January 1, 1974. Official Gazette of the United States Patent Office, Vol. 918, No. 1, p 415, January, 1974. 1 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, *Electrolysis, Heavy metals, Electrolytes, Electrodes, Oil wastes, Anodes, Cathodes.

A patent has been granted for a method of electrolytic treatment of industrial waste water. The electrolysis is conducted by introducing the industrial waste water as the electrolyte into an electrolytic cell equipped with vertically suspended anodes and horizontal cathodes positioned near the bottom of the cell. The scum arising from the electrolysis of the heavy metal ions, fats and oils including animal, vegetable and mineral oils, various fine, solid floating matters is removed from the upper part of the electrolytic cell. The electrolytically purified waste water is removed from the lower part of the electrolytic cell. (Sandoski-FIRL)

STUDIES ON THE TREATMENT OF WASTEWATER FROM FOOD PLANTS WITH ACTIVATED CARBONS. PART I. MODEL EX-

PERIMENTS ON ADSORPTION OF TYPICAL ORGANIC COMPOUNDS, (IN JAPANESE),
National Food Research Inst., Tokyo (Japan).
M. Sugimoto, M. Takagi, and H. Yoshii.
Nippon Shokuhin Kogyo Gakkaishi, (Journal of Food Science and Technology), Vol. 20, No. 7, p 229-303, 1973. 7 fig, 1 tab, 16 ref.

Descriptors: *Adsorption, *Activated carbon, *Organic compounds, *Food processing industry, *Waste water treatment, Model studies.
Identifiers: Freundlich adsorption isotherm, Starch.

The adsorption capacity of activated carbons was evaluated using several kinds of organic substances. Adsorption capacity and rate were represented by the Freundlich adsorption isotherm. For powdered activated carbons 1/h values were as follows: phenylalanine 0.2-0.3; soluble starch and methionine 0.4-0.6; glucose 0.5-0.6; lactic and glutamic acid 0.6-1.0; and, polypeptone 1.3-1.8. And for granular activated carbons these values were: phenylalanine 0.3; lactic acid, methionine, glutamic acid and glucose 0.5-0.7; polypeptone 1.0-1.4; and, soluble starch 0.37 and 2.84. The amount of activated carbons required for removal of those solutes to 80 percent level in 100 ml solution, showed the lowest value (0.5-0.9 g) in case of phenylalanine with both powdered and granular carbons, and the highest value (above 10 g in case of soluble starch) with granular carbon. AN ACTUAL EXAMPLE OF WASTE WATER TREATMENT IN A PETROLEUM FACTORY,
H. Tada.
In: Proceedings of the 1974 All-Japan Pollution Control Technical Conference, Tokyo, Japan, June 10-14, 1974. p 11-20, 6 fig, 6 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil wastes, Treatment facilities, Polymers, Aeration, Activated sludge, Biological treatment, Costs, Maintenance, Biochemical oxygen demand, Suspended solids.
Identifiers: Petroleum factory wastes.

The first stage of the Oita petrochemical complex was completed in June of 1969 with the construction of the ethylene center and annual production of 150 kt ethylene. The liquid waste produced in this complex comprises waste water from the monomer, polymer, cracker, and utility plants. With the exception of the monomer plant, which is acidic, the others are neutral; suspended substances are high in the polymer and utility plants; oil is high in the cracker plant; and BOD is high in the monomer and cracker plants. Pressure flotation treatment is applied to the waste water from the polymer and cracker plants, and a further biological treatment is given to the latter. Utility water is treated by settling, and waste water from the monomer plant is neutralized and then biologically treated. For biological treatment, one system uses an aeration activated sludge tank while the other uses a UNOX activated sludge tank. UNOX aeration, with a high purity oxygen atmosphere, can tolerate heavy loads and concentration shocks. UNOX can treat a load of BOD-SS about three times heavier than normal with 2-3 times more BOD volume and still achieve a 99% BOD removal. The maintenance, measurement and analysis methods, treatment costs, and future expansion plans of this water treatment system were also discussed. (Seigle-FIRL)

METHODS AND COSTS OF INDUSTRIAL EFFLUENT TREATMENT,
Ciba-Geigy Limited, Duxford, Cambridge, Environmental Technical Services Group.
K. G. Singleton.
Chemistry and Industry, No. 6, p 233-237, March 20, 1976. 1 fig, 5 tab, 7 ref.

Descriptors: *Chemical industry, *Waste water treatment, *Industrial wastes, Waste discharge, Economics, Water pollution control, Effluents, Plastics, *Costs, Design, Treatment facilities.
Identifiers: *Synthetic resin industry wastes.

Economics have become a significant criterion in the evaluation of industrial effluent treatment in Great Britain. In the synthetic resin industry, the Duxford site of the Plastics Division of Ciba-Geigy (UK), Limited, has designed its treatment facilities from an economic standpoint. Waste waters from the factory contain methanol for-maldehyde, and phenol, as well as traces of resin in solution and suspension. These organic effluents are diluted, and domestic sewage from the neighboring area is added. The combined wastes are pumped from a storage lagoon to a completely mixed activated sludge plant. Air is supplied by a mechanical surface aerator. Primary activated sludge is followed by secondary activated sludge and biological filters in parallel. Excess cooling water from the factory is used for dilution of the treated effluent before discharge into the River Cam. In order to treat the chemical wastes most economically, all new products are evaluated at the laboratory bench and any byproducts are considered for possible recycling. Waste materials are analyzed and a pollution load factor is established as a percentage of the existing load to the effluent treatment plant. With Duxford's policy of reclamation before degradation, savings in recovered raw materials have accounted for almost two times the annual operating costs for the plant. (Kramer-FIRL)
